She graduated in Pedagogy in 1945 on Instituto Superior de Filosofia Ciências e Letras *Sedes Sapientiae* (*Sedes Sapientiae* Higher Institute of Philosophy, Science and Letters) in São Paulo, Brazil, achieving a Bachelor's degree in Pedagogy. Her deep interest in becoming a teacher at Colégio Caetano de Campos (Caetano de Campos school) in São Paulo and the educational possibilities, offered to women at that time, led her to choose this course. Several teachers had influence on her initial education, among them, teacher Alexandre Corrêa (1890–1984) in the History of Philosophy classes and teacher Leonardo Van Acker (1896–1986) in the Logic classes. Her first knowledge about Psychology happened on the classes taught by Mother Cristina (1916–1997), a teacher who had a special influence on her formation and maturation as a person.

In 1944, while she was in her third year of Pedagogy, she started her first job teaching Geography and History at Colégio Assunção (Assunção school), in São Paulo, and proved, through this experience, her vocation for teaching.

In 1946, she taught Education at Curso Normal (Normal Course) in the city of Taubaté, São Paulo. After a short period, she took on the position of Educational Advisor in the same city, and in 1947, she was transferred to the Department of Education in São Paulo, being hired initially as a high school inspector and, later, as a pedagogical supervisor.

In 1948, she started teaching in higher education, at Instituto Superior de Filosofia Ciências e Letras *Sedes Sapientiae* (*Sedes Sapientiae* Higher Institute of Philosophy, Science and Letters), as a School Administration professor. She sought further knowledge in the area with Moysés Brejon (?–?) and José Querino Ribeiro (1907–1990), professors at the Universidade de São Paulo (University of São Paulo) and full professors in the School Administration field.

From 1951 to 1953, family life took on special importance, leading her to temporarily withdraw from her academic and professional activities. In 1954, with the children being more independent, she was able to return to her studies in the Graduate Program in Clinical Psychology at Instituto *Sedes Sapientiae* (*Sedes Sapientiae* Institute) in

São Paulo, Brazil. The enrollment was open to Pedagogy graduates, since there were no Psychology graduates in Brazil at that time. At the end of the course, in 1954, she received the title of Specialist in Clinical Psychology. During this course, she developed a deep interest in psychotherapy and started working as a psychotherapist from 1955, at first under the supervision of psychiatrists Dr. Haim Grünspum (1927–2006) and Dr. José Ângelo Gaiarsa (1920–2010) and, later on, independently.

From 1960 to 1964, she worked as a psychotherapist and internship supervisor at the Psychological Clinic of the *Sedes Sapientiae*. Her activities as a psychotherapist contributed to develop, in an experiential way, the knowledge and understanding of human beings. Psychoanalysis gradually became insufficient to answer her questions about personality dynamism and the possibilities of recovering psychological balance. The contact with clients led her to study other theoretical approaches, especially Carl Rogers (1902–1987), Carl Jung (1875–1961), and Martin Buber (1878–1965), which complemented her training as a psychotherapist.

Still in 1960, besides being a psychotherapist and internship supervisor, she returned to her activities as a professor at Faculdade *Sedes Sapientiae* (*Sedes Sapientiae* College), teaching School Administration and, in 1965, Psychology classes. Also in 1960, she started her activities as a Psychological Counselor.

In March 1963, with the regulation of Psychology as a profession in Brazil, Yolanda got the title of psychologist (registration n.225/63-MEC), from Diretoria de Ensino Superior do Ministério da Educação e Cultura (Board of Higher Education of Brazilian Ministry of Education and Culture).

In 1969, she started her doctorate at the Psychology Institute of Universidade de São Paulo (University of São Paulo), Brazil, under the orientation of Prof. Dr. Oswaldo de Barros Santos (1918–1998), one of the founders of USP's Psychological Counseling Service and pioneer in Brazil of Person-Centered Approach, when she deepened her knowledge about Carl Rogers' theory (1902–1987). Professor Maria José de Barros

Fornari de Aguirre (1921–2005) and Professor Arrigo Leonardo Angelini (1924–) were references in her training at that time. In 1973, she got the title of Doctor in Sciences-Psychology from the Institute of Psychology of Universidade de São Paulo (University of São Paulo), Brazil, with the thesis "Psychotherapeutic techniques and rogerian therapeutic counseling," being approved with distinction.

Still in 1973, from suggestion of Dante Moreira Leite (1927–1976), she deepened her knowledge in Phenomenology and Existentialism. The works of Martin Heidegger (1889–1976), Ludwig Binswanger (1881–1966), Medard Boss (1903–1990), Jan Hendrik Van den Berg (1914–2012), and Viktor Frankl (1905–1997) became part of her main readings, in addition to her reference author, Martin Buber (1878–1965).

Throughout her professional life, Yolanda sought to conciliate her activities as a researcher and psychotherapist with teaching, her passion since the beginning of her career. She taught at two educational institutions: Pontifícia Universidade Católica de São Paulo (Pontifical Catholic University of São Paulo) and the Institute of Psychology at Universidade de São Paulo (University of São Paulo), where she contributed to the training of young students for the professional practice of psychology.

In July 1978, she got the title of Associate Professor at the Education Center of Pontifícia Universidade Católica de São Paulo (Pontifical Catholic University of São Paulo) and, in December 1981, in a competitive examination, she was promoted to Full Professor. From 1954 to 1986, she taught the classes of Personality Psychology at the undergraduate course and Existential Counseling and Phenomenological Interventions at the graduate course at the same institution.

At the Psychology Institute of Universidade de São Paulo (University of São Paulo), she was hired in September 1976 as a PhD Professor at the Psychology, Learning, Personality and Human Development Department. At this institution, she taught Personality Psychology, Existential Analysis, and Personality classes in the undergraduate

and graduate courses. In July 1991, she got the title of Associate Professor and, in April 1992, the title of Professor in Psychology with the thesis “Phenomenology of existence from a university teacher” and, in May 1993, the title of Full Professor in the specialty of Counseling Psychology.

During these times and institutions, Yolanda was a professor and supervisor of 12 doctorate and 20 master’s degrees and participated in more than 400 examinations of theses, dissertations, and competitive examinations for entry and promotion in the teaching career in several Brazilian universities. In addition, she provided free psychological counseling and psychotherapy to teachers, employees, and students of these institutions. After years of dedication, she retired from PUC-SP in 1986 and from USP in 1995, after turning 70 years old.

She has done several researches, eight of them based on the phenomenological referential, sharing her knowledge in national and international congresses. She has taught courses in several capitals of Brazil and abroad, particularly in Rome (Italy), where she was an invited professor at Università La Sapienza (La Sapienza University). In 2012, she received the Silver Medal of Honor for Merit in Paris, France, by the Academie Internationale “Le Mérite et Devouement Français” (decret du 16 aout 1901) for exceptional services to the human community.

On September 22nd, 2004, Yolanda was elected to occupy the chair number 1 in the Academia Paulista de Psicologia, whose patron is Francisco Franco da Rocha (1864–1933). In 2005, she became an academic of Academia de Ciências da Associação dos Funcionários Públicos de São Paulo (Science Academy of the Public Employees Association of São Paulo), occupying chair number 20, whose patron is Mário Schenberg (1914–1990). And, in 2008, she received the title of Honorary Member from Academia Paulista de Educação (Paulista Academy of Education).

Yolanda Cintrão Forghieri, throughout her career, has focused her studies, research and teaching on the phenomenological approach in Psychology, adopting it as a reference in her

activities as a teacher, researcher, counselor, and psychotherapist.

Mexico · Humanist psychoanalysis · Group psychotherapy and institutions

He is the son of Moisés Fortes (1893–1956) and Eugenia Rudoy de Fortes (1895–1979), belonging to a Jewish family. He arrived in the Mexican Republic via the island of Veracruz in 1930. He emigrated from Russia and requested his naturalization on July 2, 1940, according to data from the official newspaper of that year. He married Beyla (Bertha) Besprosvany Shwarzer (1924–2015) on May 27, 1942, in Distrito Federal (today Mexico City). From this union they had three children, Jorge, Mauricio, and Jacqueline. His daughter Jacqueline was trained in the field of clinical and social psychology.

In 1942 he received his medical degree from the Mexico City School of Medicine; in 1944 he began his residency in psychiatry in Omaha, Nebraska, where he collaborated in the neuropsychiatry area of Clarkson Memorial Hospital. In his residency he worked with patients traumatized during the Second World War, using group intervention techniques that were the axis of his clinical work.

He was a member of the American Psychiatry Association (APA), joining the group of mental health specialists who were included in the directory of psychiatrists in Latin America formed by the Pan American Health Organization (PAHO) (1968). The inclusion of Fortes is due to the fact that he was a dominant figure in Mexican psychiatry in the 1950s. He continued his work as a psychiatrist throughout his life.

In 1950 Fortes Rudoy, Alfonso Millan Maldonado (1906–1975), Raúl González Enríquez, and José Zozaya (?–1957) invited Erich S. Fromm to give a seminar on dynamics of the unconscious, in the framework of the specialization course in psychiatry that was dictated in the Faculty of Medicine of the UNAM (Reyna & Urrego, 2019).

Fortes was part of the group that formed the first generation of Mexican psychoanalysts, called *Grupo Mexicano de Estudios Psicoanalíticos (Mexican Group of Psychoanalytic Studies)*, beginning their training in mid-1952 and graduating in 1956 (Derbez, 1981). Among the participants of that group were two generations of scientists: veteran psychiatrists Raúl González Enríquez, Alfonso Millán, Guillermo Dávila García, Abraham Fortes, and José F. Díaz and a group of young people interested in psychosomatic medicine formed by Aniceto Aramoni, Jorge Derbez, Arturo Higareta, Armando Hinojosa, and four doctors recently specialized in psychiatry in the United States: Ramón de la Fuente Muñiz, Jorge Silva García, Francisco Garza, and Jorge Velasco Alzaga. Shortly after joined the Colombian José Gutiérrez (Silva, 2006).

It should be noted that the aforementioned analysts in training had a great participation and influence in the spread of psychoanalysis in Mexico, although this group of disciples dissolved after Fromm's departure to Switzerland (Delahanty, 2013).

His training as a psychoanalyst was carried out under the tutelage of Fromm, who performed the task of teacher, supervisor, and analyst for the candidates in training. Derived from this training, Fortes received recognition as a psychoanalyst by the postgraduate division of the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM); that field of specialty was not recognized until 1960 when it was formalized, and the Facultad de Medicina (Faculty of Medicine) through the División de Estudios de Posgrado (Postgraduate Studies Division) recognized it through the corresponding degrees: a diploma for the Specialization Course

in Psychoanalysis (as a medical specialty) (Rocha, 2001).

He conducted research under Fromm's leadership in a peasant community of Chinconcuac, located in the state of Morelos, and he collaborated in an empirical study in order to determine the social character of the inhabitants of the Legaria Housing Unit, located in the Anáhuac neighborhood of the Distrito Federal (Díaz, 1974).

He was a founding member of the Sociedad Psicoanalítica Mexicana (Mexican Psychoanalytic Society) (SPM) founded in 1956, and in 1963 he was part of the Instituto Mexicano de Psicoanálisis A.C. (Mexican Institute of Psychoanalysis), institutions whose purpose was to stimulate the development of psychoanalytic science in Mexico (Millan, 1965).

In 1965 Abraham Fortes was forced to resign to the Sociedad Psicoanalítica Mexicana (Mexican Psychoanalytic Society), because after 13 years of analysis with Fromm he decided to end his treatment and seek a Freudian-type psychoanalysis (Saavedra, V, 1994 in Delahanty, 2013). In some way it was a complain directed to Fromm because he considered that he did not receive efficient psychoanalytic treatment from him, looking for it in Avelino González (1920–1981), a member of the Asociación Psicoanalítica Mexicana (Mexican Psychoanalytic Association) (APM). This situation bothered Fromm because it came from one of his disciples who, after having completed his training and analysis in humanist psychoanalysis, decided in some way to return to the orthodox postulates. "Faced with my decision to suspend the analysis, Fromm told me that I had to resign from the Mexican Psychoanalytic Society" (Saavedra, 1994: 141).

He entered as a professor at UNAM in 1950 at the Facultad de Medicina (Faculty of Medicine) where he gave seminars on medical psychology, and in 1951 he joined the Colegio de Psicología (College of Psychology), which at that time was part of the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) (UNAM), forming part of the various currents of approach to the study of the human mind; his main

contributions were in the field of clinical psychology and group psychotherapy, being an initiator of group psychotherapy in Mexico.

One of his main contributions to the field of psychology was the planning, creation, and execution of the Specialization Course in Clinical Psychology and Group Psychotherapy in Institutions, which he built together with his wife, Dr. Bertha Besprosvany, in the Facultad de Psicología (Faculty of Psychology) (UNAM) in 1978, a specialty field that was in force until the change of psychology programs in 1999.

On August 4, 1976, he was recognized for 25 years of service in the FP, where he contributed to the training of several generations of psychologists, such as Dr. Luis Lara Tapia.

He excelled in teaching and clinical research within the faculty of psychology at UNAM; for his intellectual commitment, he was paid a posthumous tribute in December 1990 (Torices, 1991).

A topic that was of great interest to him was aggression, for which he gave a clinical seminar on the subject of hatred for 5 years (Fortes, 2019).

He was an analyst of philosophers such as Jorge Portilla (1918–1963), writers such as Ricardo Garibay (1923–1999), and painters such as Leonora Carrington (1917–2011). She painted a four-phase picture of how she visualized her relationship with him. This painting entitled "Transfer" was given to Fortes; it is currently in the "Tate Modern" in London, in the surrealism section of the museum.

In November 2015, the Fortes Rudoy family made a donation to the UNAM library of the specialized bibliographic collection of Dr. Abraham Fortes Rudoy and Dr. Bertha Besprosvany (Fortes, 2019).

The contributions of Abraham Fortes to psychology and psychoanalysis in Mexico are in having been an initiator of group psychotherapy; training several generations of psychologists, many of them now important figures in the discipline; and founding with other human behavior scholars the first school of psychoanalysis, where he taught the first generations of in-training psychoanalysts.

Franco Córtez, Carlos

Born *Lima (Peru)*, June 4, 1939

Died *Lima (Peru)*, December 9, 2011

Mauricio Borja-Mostacero
Universidad Ricardo Palma, Lima, Peru

Keywords

Peru · Social psychology · Political psychology

Carlos Franco Córtez studied psychology at the Universidad Nacional Mayor de San Marcos (National University of San Marcos, UNMSM, Lima), which awarded him the degree of psychologist in 1968. He also studied at the University of Louvain (Belgium), which awarded him another degree in psychology in 1969 (with a major in social psychology).

Franco, with sympathies for communism, began his intellectual production writing on topics with content related to the dynamics of social groups during the 1970s (Franco, 1975, 1979). He was an active participant in Peruvian politics, especially during the military government (1968–1975) of Juan Velasco Alvarado (1910–1977), of which he was an advisor for psychosocial issues between 1970 and 1975.

During those years, he worked in the *Sistema Nacional de Apoyo a la Movilización Social* [National System of Support to the Social Mobilization, SINAMOS], led by Carlos Delgado (1926–1980, the government's ideologue), which organized and mobilized residents in defense and support of the military government. Years later, it would fulfill the same function during the first government (1985–1990) of president Alan García (1949–2019).

His participation as an advisor in the government of Velasco Alvarado as in that of Alan García earned him numerous enmities and attacks. He was syndicated as one of the ideologues of the failed nationalization of the Peruvian banks that President García attempted in 1987. During García's second government (2006–2011), he was appointed in 2009 Peru's ambassador to Uruguay, an appointment which caused to numerous criticisms from his enemies and from many who, from the Peruvian left, had been his students. Their former colleagues from the Communist Party and their students accused him of betraying "popular causes."

He was a professor of social sciences at his *alma mater* and at the Universidad Peruana Cayetano Heredia (Cayetano Heredia University, UPCH). In 1977 he founded the *Centro de Estudios para el Desarrollo y la Participación* (Center for Studies for Development and Participation, CEDEP) and the journal *Socialismo y Participación*, which addressed social, political, and economic issues and was very influential at the time (Zevallos, 2012).

Possessing extensive knowledge of Marxism, he theoretically analyzed the conception of democracy in Latin American countries (Franco, 1998) and the changes produced in Peruvian society from the 1970s.

Characterized by controversial political positions, Franco Cortéz is nevertheless one of the most important social psychologists of twentieth-century Peru. His classes at UNMSM and UPCH were closely followed by psychology students, and many social psychologists recognize the influence of his ideas on his work. Due to the enmities and resentments generated by his support for the aforementioned governments, the

newspapers and magazines stopped referring to him and his ideas, the same ones that he continued to express through *Socialismo y Participación* that was published until 2009.

Keywords

Brazil · Psychoanalysis · Alienism · Eugenics · Foundation of institutions

Francisco Franco da Rocha was a Brazilian psychiatrist graduated in medicine in Rio de Janeiro in 1890; he was a disciple of João Carlos Teixeira Brandão (1854–1921), with whom he worked, during his medical training at Hospício Pedro II (Pedro II Asylum) (Antunes, 2001). He did not pioneer psychoanalytic practice, but encouraged Durval Bellegarde Marcondes (1899–1981) to articulate the Brazilian psychoanalytic movement in the late 1920s.

He was the first alienist of the Asilo de Alienados de São Paulo (Sao Paulo's Asylum of the Alienated of São Paulo), at the end of the nineteenth century, which had hitherto been directed by laypeople. He denounced the precarious conditions of the institution and proposed the creation of a hospice based on scientific knowledge, defending the “rational asylum.” He was responsible for the psychiatric reform of São Paulo, having founded the Hospital Psiquiátrico do Juquery (Juquery's Psychiatric Hospital) where agricultural colony were inaugurated in 1898, the first institution from São Paulo to treat “mental illness” from a medical-scientific perspective and in humanist ideals. This institution, which was considered the largest of its kind in Latin America, sought to develop patient care through material, social, psychological, and moral conditions favorable to welcoming, with the use of psychosocial therapies, such as work therapy, ergotherapy, and psychological assistance to the relatives of inmates. In 1922, he created a special pavilion for “abnormal kids and teenagers,” entrusted to Antonio Carlos Pacheco e Silva (1898–1988), which later succeeded him in the direction of the Hospital.

Franco da Rocha, updated in relation to the movements of European psychiatry, approached Freudian theories, having been one of the pioneers of its diffusion in Brazil, particularly in the chair of Clínica Psiquiátrica e Neuriátrica da Faculdade de Medicina de São Paulo (Psychiatric and Neuriatric Clinic of the Faculty of Medicine of São Paulo), between 1918 and 1923. Mendes (2018) points out that Franco da Rocha was also part of the faculty of *Universidade Livre de São Paulo* (Free University of Sao Paulo) between

1922 and 1917, a private educational institution that covered early childhood education to higher education and constituted himself as one of the germs of the Faculdade de Medicina de São Paulo (School of Medicine of Sao Paulo), later incorporated into the Universidade de São Paulo (University of São Paulo).

He was a member of the advisory board and one of the founders of the *Sociedade Eugênica de São Paulo* (*Eugenics Society of São Paulo*), the first eugenics society in Latin America, founded by Renato Kehl (1989–1974) in 1918, together with Arnaldo Vieira de Carvalho (1867–1920), José Olegário de Almeida Moura, and Artur Neiva (1880–1943), among others (Diwan, 2007, p. 11). Following the global trend, the assumptions of eugenics were recurrent guidelines in the intellectual and scientific field, defended especially by physicians, jurists, and educators. Franco da Rocha also had a participation in the Brazilian League of Mental Hygiene, created by Gustavo Riedel (1887–1934), whose purpose was to improve the assistance to the “mentally ill”; however, later this entity changed this orientation and began to promote the eugenic ideas.

In the first three decades of the twentieth century, he created the *magazines Estatísticas e notas: Memórias do Hospital do Juquery* (*Statistics and Notes: Memories of the Juquery's Hospital*) and *Arquivos da Assistência a psicopatas do Estado de São Paulo* (*Archives of The Assistance to psychopaths of the State of Sao Paulo*). His main contribution to psychology was to have been one of the pioneers of the introduction of Freud's ideas in Brazil, for his studies and for the teaching of these ideas, which made him one of the trainers of the first psychoanalysts in São Paulo.

When Julio Napoleón Franco Armenta was three, and then again at six years old, the country would live two of its most complex historical events: first, the presidency of Laureano Gómez, elected during a very politically violent time triggered by the murder of the Liberal leader Jorge Eliécer Gaitán; second, the dictatorship of the general Gustavo Rojas Pinilla, who overthrew Gómez in a coup d'état and fell after a National Civil Strike

in 1957. Without a doubt, such turmoil influenced Napoleón's keen sociopolitical mind.

He started his primary studies in Cartagena, continued in Cúcuta, and finished them in Bucaramanga. His high school years were not much different; he began studying in Medellín and continued in Cali and Popayán. All of this moving around (as a result of his father's work) allowed him to come into contact with the mentality of many of the country's diverse regions, communities, and social and economic strata. This amplified his perception and understanding of the people and the nation.

Napoleón studied psychology at the Pontificia Universidad Javeriana [Pontifical Javeriana University] between 1968 and 1972. In 1969, he worked as a pollster for the firm *Consumer*, did university internships at the Sibaté Mental Hospital and the Central Penitentiary of Colombia. In 1970 he received his Certified Pollster credentials from the National Institute for Radio and Television and the Popular Training Fund. From 1970 to 1972, he studied Group Management and Dynamics under Jose Francisco Socarrás, taught Industrial Psychology at the Pontifical Javeriana University, and worked as the Director of the Motivational Studies Department at *Consumer*; in 1973, he became the Executive Director of that firm. During that year, he also taught Social Psychology in Media at the Universidad Jorge Tadeo Lozano [Jorge Tadeo Lozano University] and Organizational Development at the Universidad Externado de Colombia [Externado Colombian University] and published several articles.

In 1974, he became a member of the Association of Directors of Sales and Marketing and the Colombian Society of Psychology. He became a teacher at the Universidad de Los Andes [University of Los Andes], continued teaching Advertising Psychology at the Jorge Tadeo Lozano University, and did a specialization at Universidad Nacional Autónoma de México [Autonomous National University of Mexico]. He also organized the Market Research Department for Leo Burnett Colombia and became their Vice-president of Research for Latin American markets. In 1975, he taught Organizational

Psychology at the Pontifical Javeriana University and Professional Psychology at the University of Los Andes; he became a member of the Latin American Association for Social Psychology and the International Advertising Association.

In 1976, he rose to become the vice-president of Leo Burnett Colombia, but left in 1977 when he decided to start his research firm, Napoleón Franco and Associates. The firm is known as the “first Colombian firm dedicated to consumer research, and measurement of consumer sentiment in marketing and advertising” (*El Tiempo*, September 17, 1977). That same year he joined the Management Consultant Association, and the Federación Colombiana de Psicología [Colombian Federation of Psychology].

Starting in 1980, Colombia went again through a period of social and political upheaval that would last over a decade, ceasing finally in September of 1989 when a peace agreement with the government was signed. The following ten years were filled with challenging political situations, plus several natural disasters which all added pressure to the country’s socioeconomic structure, leading it finally to an economic recession in 1998.

During this complicated time, against all odds, Napoleon Franco continued to grow his business, and the firm went through several transformations. In 1981, it changed its name to Napoleon Franco & Co, and in 1982 it opened a branch in Bogota after working out of Cali for over five years. In 1985, it also extended its operations to Medellin. In 1987, working with two colleagues, Napoleón created the National Opinion Institute (ION), dedicated to sociopolitical and electoral studies, and social behavior and public opinion research. Due to the uncertain sociopolitical climate in Colombia, these types of studies gained a great deal of importance, both for the country and for Napoleón Franco. He became the most prominent spokesperson of the opinions of Colombian citizens.

Leading up to the 1990 presidential election, Napoleón Franco conducted his first political polls intending to inform the country at large about the opinions of voters before the elections. Under high levels of scrutiny about the results of

his presidential polls, Franco decided to prove the quality of his work by submitting a closed envelope with the latest results from his research before the election to a notary public and opening it in public the day after the election. When released, his predictions were within decimal points of the electoral results, validating his ability to measure public opinion accurately. After his success, during the 1990 presidential elections, Franco and his firm were recurrently hired by Colombia’s presidents, mayors, governors, and Chambers of Commerce to research and represent the opinions of citizens.

From a media perspective, after visiting the Ibope headquarters in Brazil a couple of years prior, Napoleón decided to bring electronic measurement for television audiences to the country. In 1991 he created Infoanálisis, a division dedicated to studying investment in advertising, and in 1992 he established Ibope Colombia, his third firm, which specialized in media audience measurement; he brought the first *people meters* for electronic measuring of television audiences to Colombia.

After establishing his company as one of the largest and most trusted market research firms in Colombia, in 2003, Napoleon Franco & Co. began fusing with Ipsos, the French multinational, which ended in 2005 with the new firm Ipsos-Napoleón Franco. In 2006, The Chamber of Commerce of Bogota awarded the firm an important Recognition for its 25 years of operation.

Napoleón also continued to participate as a spokesman in several conferences. He was invited five times to the National Advertising Conference; he was also invited to the Planning and Analysis for Market Research Conference. He additionally received awards like the Megamarketing Star for market research. Franco remained involved in Ipsos-Napoleón Franco until he passed away in 2021.

Napoleón Franco’s contribution to the advancements in consumer psychology in his country is made clear by the countless studies that his firm created and that revolutionized the whole market research field in Colombia. He was the first to offer mechanisms like: focus groups, in-depth interviews, pre-testing using Audience

Reaction Testing, package testing for visual impact, and several quantitative studies, to point out a few. In 1983, for example, he was the first to carry out brand positioning studies by using perceptual maps and multivariate analyses. In 1985 he standardized the PRA, Audience Reaction Test, used to analyze advertising and programming for television, and in 1986 he was the first to study Colombian mentality concerning democracy and free enterprise.

Every single area of Colombian society saw at least one study created by Napoleon and his firm. Overall, he conducted thousands of research studies for both private and public purposes, which brought insight to the collective psyche of Colombians. Napoleon Franco researched everything from electoral polling to coffee drinking, from women's personal care items to oil and gas. He was a pioneer in his area and taught, directly or indirectly, hundreds of market researchers in Colombia and Latin America, earning him the title of Master of Masters in Market Research in Colombia. He had a talent for seeing beyond the numbers, for going deeper into the mechanisms of the Colombian psyche. As he said himself at a National conference to end his keynote speech, "The country fools itself when working only with economic indicators; it should be asking the people, in order to really get to know them."

Psychological development of twins

Elena is the daughter of Engineer Alberto Franklin Martínez and Angelina Capriles de Franklin. She completed her primary and secondary education at the Colegio San José de Tarbes (San Jose de Tarbes School) boarding school in Caracas (1949–1960). She obtained her bachelor's degree in Humanities in 1960. She began her higher education at the age of 17 when she entered the School of Psychology at the Universidad Central de Venezuela (Central University of Venezuela) (UCV). An outstanding student, she was a lecturer of the *Lecturas de Filosofía* (Readings in Philosophy) Chair. She went on to obtain her degree in Psychology (1964) where she was ranked fourth in her class.

She began her professional experience in the school where she studied elementary and high school. She collaborated in the creation of the psychology service for students, teachers, parents, and representatives, organizing vocational orientation programs and workshops as well as teaching psychology classes. She was invited temporarily to teach Developmental Psychology at the Escuela de Psicología (School of Psychology) of the Universidad Católica Andrés Bello (UCAB, Andres Bello Catholic University), which was the beginning of her experience in Higher Education, and which she practiced for more than 40 years. In 1974, she joined the selection division of the Gran Mariscal de Ayacucho Scholarship Program as a psychologist.

In 1976, she joined the Universidad Metropolitana (UNIMET) (Metropolitan University), in Caracas, as co-founding professor of the

Escuela de Educación (School of Education). There she designed a special admission system for the school, as well as the syllabus for the courses of Psychological Development of Children, Adolescents and Adults, Personal Development of Teachers and Research Methodologies, courses that she taught for 20 years. Parallel to teaching, she organized the first preschool – kindergarten – for the children of teachers and employees of UNIMET. She served as Director in charge of the School of Education at UNIMET on two occasions.

She completed a master's degree in Psychology of Human Development at the Universidad Central de Venezuela (UCV, Central University of Venezuela), Caracas (1986–1990), where after graduating, she was a professor for 3 years, sharing the course of Research Methodology. At that time, she was appointed Director of Admissions (Undergraduate and Graduate) by the authorities of UNIMET, a position she held for 6 years. There she designed new systems and promotional strategies for the University in public and private campuses, with the support of a group of professors and students, organized the entrance exams and placement of applicants, and developed research on the profile of student admission and its relationship with the pursuit of studies.

She assumed the position of Director of Studies Control (1996–1998), during which time she also completed studies in Educational Management at the Instituto de Estudios Superiores de Administración (IESA, Institute of Higher Studies in Administration), a Diploma in Teaching Skills under an agreement between UNIMET and the Instituto Tecnológico de Estudios Superiores de Monterrey (Technological Institute of Higher Studies of Monterrey), Mexico City Campus. In addition to an Advanced Program in Technology, Learning and Knowledge within UNIMET.

Between 1998 and 2004, she was a professor in the Departamento de Didáctica (Department of Didactics) at UNIMET. She was part of the Commission of the New Educational Model of this university and together with other members of this department, she designed a program for the development of teaching skills to update active and new teachers, to train them in a

new educational model based on the four pillars of UNESCO (Learning to know, to do, to be, and to live together), which was called *Aprendizaje Colaborativo en Ambientes distribuidos* (Collaborative Learning in Distributed Environments, AcAd Model) and training in some technological platforms to begin to design units of subjects of a semi-presential and virtual character.

In 2002, she began doctoral studies at the Universidad de Sevilla (University of Seville), Spain, culminating in 2008, with a doctoral thesis on the design, implementation, and evaluation of a blended learning program for the development of teaching skills at UNIMET.

Between 2001 and 2002, together with Mari Carmen Lombao and María Angélica Sepúlveda, she proposed the organization of the Psychology undergraduate program at UNIMET. In May 2004, the Consejo Nacional de Universidades (National Council of Universities, CNU) approved the Psychology Degree Program and on October 4 of the same year, UNIMET opened it to receive 120 students in what would be the seventh psychology school in the country and the sixth in private school.

Dr. Martínez was appointed as the first Director of the new Escuela de Psicología (Psychology School), a position she held for 10 years (2004–2013). During her tenure, she organized the Departamento de Ciencias del Comportamiento (Department of Behavioral Sciences), the first Psychology Laboratory, coordinated diploma and specialization programs, and redesigned the Psychology Undergraduate Program.

In 2001, she assumed the direction and organization of the II Venezuelan Congress of Psychology, at the headquarters of UNIMET, which was attended by renowned national and international specialists and researchers.

She was a member of the Board of Directors of the Federación de Psicólogos de Venezuela (Federation of Psychologists of Venezuela, FPV), holding the position of Treasurer (2013–2015) and then as a member, a role from which she promoted and encouraged the aggregation of professionals. Her line of research was

oriented towards the evaluation of psychoeducational processes in higher education and psychological development of twins and identical twins and guidance on their upbringing in the family and at school.

She has published more than ten articles in several journals and scientific events. She published the book *Identical Twins. Guidance on Their Upbringing and Psychological Development, Both at Family and at School*, product of her reflections as a mother of twins and psychology professional (Franklin de Martínez, 2016).

Paulo Freire graduated from the Faculty of Law of Recife in 1946 but spent his whole professional life in the area of education. Between 1947 and 1954 he acted as director of the sector of Education and Culture of the Social Service of Industry (SESI) of Pernambuco. From 1954 to 1957 he was superintendent of the institution. In 1960 he was appointed professor of Philosophy and History of Education of the Faculty of Philosophy, Sciences and Letters of the Universidade de Recife (University of Recife), currently the Universidade Federal de Pernambuco (Federal University of Pernambuco). In 1961, together with other educators, he was appointed to the Board of Education of Recife and, later, to the Culture and Recreation Division of the Recife Local Municipal Government.

In the first years of the 1960s, he took on various functions simultaneously, which indicates his engagement in different cultural, educational, and political activities not only at the local (Recife) but also the state level (Pernambuco) and, subsequently, at the national level. Thus, he participated in the creation of the Movimento de Cultura Popular (Popular Culture Movement) (MCP) of Recife (1960), he was a director of the Cultural Extension Service of the University of Recife (1962), member of the Pernambuco State Board of Education (1963), President of the National Committee of Popular Culture (1963), and coordinator of the National Literacy Programme, promoted by the Ministry of Education (1964) (Beisiegel, 1999; Freitas, 2000; Osorio, 2003; Zitkoski, 2010).

In these activities, Paulo Freire invested above all in the valorization of popular culture and the education of illiterate adults. He used them to develop his method of making adults literate, which came to be known as the “Paulo Freire Method.” This was used in the abovementioned National Education Programme of 1964, which had as its goal to make five million adults in the whole of Brazil literate (Beisiegel, 1999; Freitas, 2000; Osorio, 2003; Zitkoski, 2010).

Paulo Freire thought that education could not be politically neutral. Due to his conception of education, his method of making adults literate involved discussion on the conditions of life of

illiterate adults and, inevitably, led also to discussion about the conditions of life of the less favored populations. In this way one can arrive at an identification between politics and education. He was considered subversive, a danger to the established order, when the military *coup d'état* of 1964 occurred. The *coup d'état* suspended the National Education Programme. Following this Paulo Freire was considered a political enemy and detained for a period of approximately 60 days.

In September 1964, after being released, he decided to go into exile. He stayed for a short while in Bolivia and soon afterwards moved to Chile. It was in exile in this country that he wrote his best known work, "Pedagogy of the Oppressed," concluded in 1968 (Beisiegel, 1999; Freitas, 2000; Osorio, 2003; Zitkoski, 2010).

He moved to the United States in 1969, working as a guest professor at Harvard University. In the following year, he went to Geneva, Switzerland, where he took over the position of a Special Consultant to the World Council of Churches. In this position, he rendered assistance to the educational activities undertaken in different countries of Africa. The objective was to undertake literacy programs and collaborate in the building of an education for peace and liberation from the oppressive processes to which the populations of these countries were submitted, subjecting them to wars, economic crises, and military dictatorships (Beisiegel, 1999; Freitas, 2000; Osorio, 2003; Zitkoski, 2010).

He returned to Brazil in 1980, after the amnesty law had been passed in the previous year. In this year, he participated in the foundation of the Partido dos Trabalhadores (Workers' Party) (PT) and started to lecture at the Pontifícia Universidade Católica de São Paulo (Pontifical Catholic University of São Paulo) (PUC-SP) and at the Universidade de Campinas (University of Campinas) (Unicamp). He was Municipal Secretary of Education of São Paulo between 1989 and 1991. In 1991 he was also guest professor at the Universidade de São Paulo (University of São Paulo) (USP). In this period he involved himself in numerous activities, such as classes, talks, debates, interviews, conferences, publications,

and congresses (Beisiegel, 1999; Freitas, 2000; Osorio, 2003; Zitkoski, 2010).

Along his whole trajectory, Paulo Freire was an intellectual marked by his commitment to social transformation, seeking the humanization and the liberation of people more subjected to oppression in their daily lives. His work is especially focused on the theorization about the human conscience, how it is built, how it develops existentially, how it adapts to the world and criticism, with a view to overcoming whatever dehumanizes the human being in its relationship with the other, with society and culture. This view of the world had a strong impact in the field of psychology in Brazil and in other countries in Latin America, and it inspired, in the 1960s and 1970s, the building of a community Social Psychology as an area committed to the perspective of socio-political liberation of the population (Freitas, 2000). In this way, Paulo Freire, although better known as a theoretician of education, can and should be recognized for his extraordinary conceptual contribution to the psychology of the human consciousness and to epistemology.

Gilberto de Mello Freyre graduated in Waco, Texas, USA, where he attended at Baylor University and earned a Bachelor of Arts in Liberal Arts, specializing in Political and Social Sciences (1920). His experiences as a student in the 1920s

in a segregated United States confronted him with scenes from the post-abolition North American racist system. Later, he moved to New York, to study at Columbia University, where he obtained a master's degree with the dissertation *Social life in Brazil in the middle of the 19th century* (1922), under the supervision of Franz Boas (1858–1942), a German American intellectual considered one of the founders of modern American anthropology. Franz Boas was a great influence on Freyre's work, considering that he adopted a culturalist rather than a biologicist bias when it comes to understanding the relationship between different ethnic groups in Brazil. This dissertation was the main argument of what would become, years later, the book *The masters and the slaves* (1933), in which the author privileges the description and analysis of slavery and the relations between whites, blacks, and indigenous people in the luso-tropical scenery (Bocayuva, 2001).

After his master's degree, in 1922, Freyre traveled through Europe to cities such as Paris, Munich, Nuremberg, London, and Oxford, disclosing his thoughts on Brazilianness studied in his dissertation. Merging his period in the United States with Europe, where he lived a total of 5 years in Europe, between 1918 and 1923, he returned to Brazil in 1923, to the city of Recife, but he did not adapt to the Brazilian academic world, as he did not directly belong to none field of teaching and research which at that time dominated the science: Law, Medicine, and Engineering (Bocayuva, 2001). Thus, he sought to break with his academic isolation through exchanges with national interlocutors who, too, were grappling with issues that were beginning to become central in his thinking: miscegenation and the future of a modern project in Brazil. In 1924, Freyre organized, in Recife, the *I Brazilian Congress of Regionalism*, which served as an intellectual-political agenda for several intellectuals who took miscegenation as a mark of the constitution of Brazilian nationality. At that time, several more regional researches circumscribed to Northeastern experiences became representational microsocial experience of this nationality. Freyre compiled, for example, recipes from white female slave owners and black slaves from some regions

of the northeast, which he would later understand as an Afro-Brazilian cultural reference, also contributing to the exaltation of the national natural wealth (Bocayuva, 2001).

In 1926, Freyre began to circulate through institutionalized politics and became private secretary to the governor of Pernambuco, at the time, Estácio de Oliveira Coimbra (1872–1937), a position in which he remained until 1930, when the provincial governments were overthrown by the 1930 Revolution. Both went into exile for fear of political retaliation. Gilberto Freyre returned to the country in 1931 and worked on what would become his most famous work, *The masters and the slaves* (1933).

He continued in public life, occupying the state presidency of the UDN (União Nacional Democrática – National Democratic Union), a more conservative party, in Pernambuco. While some academics considered *The masters and the slaves* (1933) an essay and not a scientific work, others saw it as a great reference for theoretical and aesthetic innovation in Brazilian psychological and sociological studies. Others even went so far as to point the production as a fiction that naturalized the racial conflicts existing between traditional peoples, Africans and Portuguese whites on Brazilian land.

Internationally, the work is recognized as an empirical portrait of the intimate life of Brazilian society through the relationships that took place between masters, African and Indigenous slaves in that context. Through aspects of daily life, habits, customs, routines, and, taking the family as the axis of analysis, the author reveals the space of private relationships between the various agents that helped to build Brazil from colonial times to the Old Republic. In this context, Freyre is recognized for explaining Brazil through a different perspective than what was found in the national intellectual paradigm in force until then. For a long time, Freyre was responsible for confronting the arguments of Raimundo Nina Rodrigues, a physician and professor at the Faculdade de Medicina da Bahia at the end of the nineteenth century, a supporter of socio-racial Darwinism, who postulated that extreme miscegenation was at the same time a sign and condition

of the degeneration of the Brazilian population. Something that, later on, would be located by the critical field of knowledge as Scientific Racism, because it is supposedly legitimate knowledge that collaborated in the maintenance of historically constructed racial inequalities (Skidmore, 2013).

Gilberto Freyre, on the other hand, in a tendency to criticize the more biologizing postures of Brazilian culture, lists miscegenation as the possibility of the redemption of Brazil in its modernization process, which is done through arguments that resort to historiography, to literature, philosophy, psychology, and anthropology. The question “what makes us Brazilian?” occupied the time of analysis of the intellectuals of Brazilian society at the time, and, in the context of the 1930s, many of those who set out to define a “national specificity” selected the racial problem found in the country, highlighting the particularity of miscegenation as a Brazilian ontology that would have reduced the racial distances between whites, blacks, and indigenous peoples. Thus, compared to the previous period, led by the hygienism and eugenics of Nina Rodrigues, it is possible to perceive, from the 1930s onwards, a direction towards the different “valuation” of this Brazilian mixture. From then on, instead of blemish, miscegenation began to transform itself into a promise and even national fortune, breaking with any biological or geographic-climatic fatalist-determinist reading that existed as a consensus until then (Skidmore, 2013).

Thus, although Freyre does not deny Brazilian colonial, patriarchal, and patrimonial heritages, he builds a microcosm of power relations between racialized groups, in a kind of equivalence of antagonisms that would be capable of building racial harmonization in the country. What had the effect of a discourse that softened Brazilian slavery when compared to other slaveholding nations, especially the United States. This discourse of racial harmony has resulted in the strengthening of an idea of a cohesive nation, but it was unable to take on a real debate on the insertion of black and indigenous peoples as citizens and subjects of rights in Brazilian society.

In this same direction, even though there is an advance in bringing psychosocial and even psychosexual dimensions to Brazilian scientific studies about national culture in a moralistic moment of teaching traditions, Freyre thus makes himself hostage to the traps of an aberrationist view of luso-tropical sexuality, associating non-white peoples with a certain inclination to a more available and savage sexual practice (Bocayuva, 2001).

The velvety and malicious eroticism of his narrative seems to subsume the violent element between the white man and the black and indigenous women. Thus, the author insists on seeing loving and friendly encounters between historically unequal ethnic-racial groups, reinforcing what was named, by some of his readers, as the myth of racial democracy: the belief that Brazil is the stage of a harmonious relationship between colonizers and colonized on the basis of the national family constitution (Fernandes, 1965). However, this myth – operationalized as a truth in Brazilian social and political practices – hides something beyond what it states, exerting its symbolic, material, political, and economic violence on Brazilian black and indigenous populations, especially women, as the non-white feminists analyze (Gonzalez, 1983).

Following the success that his first work allowed him, in 1934, Freyre assumed the chair of Sociology at the newly established Universidade do Distrito Federal, in Rio de Janeiro. In the years that followed, the author published articles in several newspapers. In February 1935, for example, Recife's *Lanterna Verde* magazine published *The slave in Brazilian newspaper advertisements of the 19th century*, an assessment by Freyre that takes as a point of analysis the advertisements of slave masters in search of their escaped captives, identifying the incidence and the most frequent types of corporal punishment that took place in this context. This text disputes the accusations made against him of having created an idyllic and unreal image of the violence of Brazilian slavery (Bocayuva, 2001).

In 1940, Freyre bought an old mansion, on colonial architecture, the Solar de Apipucos, in Recife, even before he met and married his wife

Dona Maria Magdalena Guerres Pereira (1921–1997). Years later, this residence was the stage for the short documentary *The Master of Apipucos* (Andrade, 1959), narrated by Freyre, which presents a kind of account of a day in his daily life.

In 1944, Freyre published *Euclid's Profile and Other Profiles*, which brought together some of his articles from his time between the ages of 25 and 30, which had not yet been published. That same year, he returned to the United States to hold, at Indiana State University, numerous conferences on his cultural studies about the racial component in societies. Upon returning to Brazil, he was elected by the UDN party for a seat as a federal deputy (1946–1951), a period in which he dedicated himself, above all, to honoring northeastern intellectuals (Bocayuva, 2001).

In the following years, the author published other works that take the debates of *The masters and the slaves* (1933), remaining involved with the ideas of qualifying a Brazilian national type. He also devoted himself to questioning the traditional sociological method. Finally, he published his last work *Men, engineering and Social Paths* (1987) – the year of his death – in which he engages in a dialogue between physical, social, and human science, considering its applicability to social and technological development in Brazilian forest regions, mainly, the Amazon.

During his career, Gilberto Freyre was awarded in different fields: literature, politics, and sociology. Such as Excelência Literária da Academia Paulista de Letras (1961); Prêmio Machado de Assis da Academia Brasileira de Letras for his complete work (1962); Aspen Institute Prize, United States of America (1967); Title Knight-Commander of the Order of the British Empire, conferred by the Queen of England (1971); and Grand Officier de l'Ordre National de la Légion d'Honneur, France (Grand Officer of the National Order of the Legion of Honor, France) (2008).

If we recognize that, even before becoming an autonomous science and profession in Brazil, Psychology was already constituted as a theoretical, conceptual, and methodological contribution to other areas of knowledge (Jacó-Vilela et al.,

2016), it is possible to consider the contributions of Gilberto Freyre to the consolidation of a psychosocial thought around the subjectivity of the Brazilian of the nineteenth and twentieth century. His contributions to the psychological field revolve mainly around investigations built from analyzes on the psychosocial processes that build Brazilian subjectivity from the intimate and private relationships between the main ethnic characters in Brazil in its colonial and postcolonial context: whites, blacks, and indigenous people. Thus, Freyre prioritizes the private space of family relationships as a central analyzer of the sociological aspects of a nation and vice versa, breaking with the scenario of biologizing readings of subjectivation until then. At the same time, Freyre, too, became himself important as a synonym for an analytical trap that, steeped in elitism and white centeredness, reinforced the construction of an unbelievable romantic Brazilianness when it is compared to its material and historical reality, radically violent.

Thus, the debates around Gilberto Freyre's work situate, at the center of the discussion of Brazilian Social Psychology, the projects of intellectuality and society that the psychosocial field would dispute from then on: either they would be more focused on harmonizing differences/inequalities ethnic-racial national or they would be more inclined to the proposition of theoretical contributions which make the conflicts between different peoples in Brazil visible.

Friedenthal, Hebe

Born *Argentina, 1938*

Died *Argentina, 1978*

Marcela Borinsky

Universidad de Buenos Aires, Buenos Aires, Argentina

Keywords

Argentina · Psychology professionalization · Buenos Aires Psychologist's Association · School of Children Clinical Psychology

Irene Friedenthal studied psychology, and she was one of the first graduates of the Universidad Nacional del Litoral (National University of Litoral), Rosario, Santa Fe. She developed an important scientific contribution with the

translation of the main works of the English psychoanalyst Melanie Klein (1882–1960) into Spanish: *Contributions to Psychoanalysis* (Klein, 1964) and *Development of Psychoanalysis* (Klein et al., 1962) as well as the *Introduction to the work of Melanie Klein* by Hanna Segal (1965).

She participated in the creation of Asociación de Psicólogos de Buenos Aires (Buenos Aires Psychologist Association) in 1962 and was part of their first directive commission. This organization supported the professional and union organization of the first psychology graduates who defended the interests of the new profession in Argentina (Borinsky, 1999). Hebe Friedenthal was dedicated to teaching at the Universidad del Litoral (National University of Litoral) and the Universidad de Buenos Aires (University of Buenos Aires), and she also traveled throughout the country to spread psychology and psychoanalysis. She published theoretical articles in specialized journals, and her works covered a wide variety of interests from projective techniques, the relationships between psychotherapy and psychological evaluation, Melanie Klein's thoughts, and Freudian ideas.

In 1967, she created with three other psychologists – María Rosa Glasserman (b. 1936), Estrella Joselevich, and Alba Kaplan – the Escuela de Psicología Clínica de Niños (School of Child Clinical Psychology). It was the first field of postgraduate training led by a psychologist for learning, research, and specialization in child psychotherapy (Kaplan, 2008). Afterward, she traveled and studied at the Tavistock Clinic and at the Hampstead Clinic with Anna Freud working on the observation of infants, the use of projective techniques, and the genetic psychology of the first year of life (Carpintero & Vainer, 2005). During this trip, she reviewed a Lacan Conference in London for the *Revista Argentina de Psicología* (*Argentine Psychology Journal*) (Friedenthal, 1976).

In a moving tribute, her companions highlighted her contributions to the history of Argentine psychology:

Together with other colleagues, Hebe Friedenthal represented a possible job profile for a career that, being just born in the country, was

nothing more than an illusion, a utopia for those who chose it. So, in that opening, psychology students and psychologists in postgraduate training approached her with the expectation of being able to find a figure that could simultaneously offer an identity model and an outlined profile for a possible professional exercise (Ducovsky et al., 1978, p. 27).

Erich S. Fromm Krause was born in an Orthodox Jewish family, and rabbinical dynasty on his father's side. He studied psychology, sociology, and philosophy in Heidelberg, Germany. At the age of 22, he obtained a PhD in philosophy with his theses "Das jüdische Geesetz. Ein Beitrag zur Soziologie der Diasporajudentums" (Jewish Law: Contribution to the sociology of diaspora Judaism) (Peris, 2005). The religious influence is evident throughout his work from which he will take the idolatry concept though he does not abandon his concept of religiousness. He develops a humanist thinking revisiting various humanist thinkers such as August Comte (1798–1857), Karl Marx (1818–1883), Baruch Spinoza (1632–1677), M. Eckhart (1260–1328), etc. for their ethical and moral principles.

He trained to become a psychoanalyst at the "Berliner Psychoanalytisches Institute" (The Berlin Psychoanalytic Institute) from 1927 to 1930 (Rocha, 2001). Disagreeing and radically questioning the Freudian method, Fromm intends

to develop a dynamic social psychology from Freud's and Marx's postulates. In 1940, he abandons Freudian orthodoxy though he never stopped considering himself a Freudian and he never gave up psychoanalysis.

Fromm differentiates Freud's psychoanalysis from his own system, which he denominated humanistic psychoanalysis and which has a social character as its main axis: It articulates the psychoanalytic theory of dynamic motivation with socioeconomic systems to the dominant production modes in particular.

It is important for him to study everyday life psychopathology, emphasizing aggressiveness and destructiveness issues as well as the analysis on how man is absorbed by a capitalist society or by alienating ideologies which he becomes supportive of and proselytizes without being conscious or critic about. He does not act insanely worshipping external objects, forgetting his inner life without being compromised to himself nor fulfilling his personal or social responsibilities (Maccoby, 1979).

He joins the "Berliner Psychoanalytisches Institut" until 1931. In 1934, along with other colleagues, he founds the "Frankfurter Berliner Psychoanalytisches Institut" (1928–1938). He was excluded from the Deutsche Psychoanalytische Gesellschaft (German Psychoanalytic Association) because he was a Jew though he remained an extraordinary member of the "Internationale Psychoanalytisches Vereinigung" (International Psychoanalytic Association).

He also belonged to the "Institut für Sozialforschung" (Institute for social Research) in Frankfurt from 1930 to 1938. There, he found the possibility to connect Freudian theories with Marx, and provide psychological and philosophical-anthropological basis to Marxism.

In 1933, as the National Society Movement takes control in Germany, Fromm flees the country and decides to establish in the United States and live in NY where he opens a psychoanalytic consultation office and starts teaching courses at the New School for Social Research, at Yale University, Columbia, and at Bennington College.

He decided to take a break, and he visited Mexico for the first time in 1935 and later returned in 1949 to live in Cuernavaca due to health issues. While in Mexico, Erich Fromm had an intense

activity in psychoanalytic practice, theoretical development, and theoretical writing as well as exercising a transcendent influence in the development and consolidation of the Mexican Psychoanalytic Movement. A group of disciples was organized around him initiating, in 1951, the training of psychoanalysts at the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM) with Fromm as a professor and didactic analyst to that first generation. In 1960, Fromm achieved, before the university authorities, to include psychoanalytic training in the curricula of the Facultad de Medicina (Faculty of Medicine) of the UNAM.

These changes have a profound effect on medical and psychological education, especially when they were included in teaching, mainly at the schools of medicine and psychology which, in the end, modified their curricula.

Fromm was the first psychoanalyst to be part of the International Psychoanalytic Association (IPA), which came to Mexico to train psychoanalysts, and founded a Psychoanalytic Institute to give courses and conferences with the active engagement of other psychoanalysts.

He studied the social nature of industrial and rural societies, emphasizing their social character matrix which has developed as an adaptation to economic, social, and cultural conditions common in a group, i.e., it describes the modeling and channeling of human energy within a society with the purpose of continuing the functioning of society.

Along with Michael Maccoby (born 1933), Fromm started a socio-psychoanalytic study in a small village of peasants: His goal was to combine psychoanalysis and sociology methodologies to implement the psychoanalytic theory to non-psychoanalyzed social groups, as well as to prove the prevailing social character theory in that village (community). For such a study, they implemented a questionnaire as an instrument Fromm had created and applied, 1929–1930, about the character of German workers; it has to be adapted and validated suiting the population to be studied and has been useful for different socio-psychoanalytic investigations. This study lasted for 10 years; during this time, knowledge of the

structure of such society was acquired. Through time, the conditions of the investigators varied, and some data they had obtained was good to take, predict, and plan the necessary changes for the well-being of that society.

In addition, the Fondo de Cultura Económica (FCE) (Cultural Resources Economic Fund) started in 1956 the psychology and psychoanalysis collection, and the publishing of the Psychoanalysis, Psychiatry and Psychology Magazine for which Fromm was first Director.

Fromm, along with a few colleagues, founded the Sociedad Psicoanalítica Mexicana (SPM) (Mexican Society of Psychoanalysis) in 1956, and in 1963 the Instituto Mexicano de Psicoanálisis A. C. (Mexican Institute of Psychoanalysis A. C.) (Silva, 1982). In 1973, due to health problems he definitely established in Locarno, Switzerland. He continued writing and participating in social movements until his death.

At present, the Instituto Mexicano de Psicoanálisis (Mexican Institute of Psychoanalysis A. C.) is no longer sponsored by UNAM. It was incorporated to Secretaría de Educación Pública (SEP) (Ministry of Public Education), and it is interesting to see psychiatrists, psychologists, and other professionals being trained under the Frommian psychoanalytic.

Gajardo Contreras, Samuel

Born *in Santiago (Chile) on Abril 23, 1894*

Died *in Santiago (Chile) on Agosto 16, 1969*

Mariano Rupertuz Honorato
Universidad Andrés Bello, Santiago, Chile

Keywords

Chile, psychoanalysis · Legal medicine ·
Psychological pedagogy

Samuel Gajardo Contreras was a lawyer, writer, and the first juvenile court judge in Chile, who was born and died in Santiago. Gajardo was a great supporter of psychology and psychoanalysis, a professor of legal medicine, psychiatry, and criminology in the Faculty of Law of the Universidad de Chile (University of Chile) from the early 1930s to 1957. He also spearheaded many initiatives for the protection of homeless children – such as the *Ciudad del Niño* (The Kid's City) in 1943–, the rights of children, and secular education (Gajardo, 1957).

Interested in the study of criminal conduct, he saw in the psychological disciplines a specialized tool for legal work: It has helped understand the motivations for crime and antisocial behavior. He also felt that since the life force came from sexuality, people urgently needed sex education. The “tragic ignorance,” in the judge's words, only led

to pain and mishaps: unwanted children, the transmission of venereal disease (syphilis and gonorrhea), and clandestine abortions (Gajardo, 1937b). Gajardo was a freemason too and condemned the church's position that such issues needed to remain family secrets.

In that sense, Gajardo recommended that parents should learn psychology to carry out a “scientific pedagogy” for their children, which would prevent neurotic conflicts from appearing in the future. For this reason, he was a prolific writer who always made time for popularizing psychological and explicitly Freudian material (Gajardo, 1940). Parents, educators, and doctors, thanks to Freud's teachings, had a better understanding of the infant's soul, and as a result, they were in a better position to avoid future illnesses. The social representations of infancy incorporated the category of the “perverse polymorph,” as described by Freud, underlining the idea that adult personality was the result of childhood life. The pedagogical interest of Freud's theories for Gajardo lay in the hope that human beings could be reconciled with their childhoods by learning about the infantile part of themselves. He was radically opposed to the violent repression of the instincts and openly recommended that educators avoid such practices through an unbiased understanding of the nature of childhood. Psychoanalysis, from this perspective, also shows that the child's perverse and antisocial instincts can make valuable contributions to the formation of his character when, rather than being subject to repression, they are diverted from

their primitive goals by the process of sublimation and directed toward other, more valuable ends (Plotkin & Ruperthuz, 2017). Our best virtues are born as reactions and sublimations on the ground of our worst inclinations. As a result, education should studiously avoid wasting those valuable sources of energy and confine itself to supporting processes that channel such energies in the right direction. From this, we can deduce that an education based on psychoanalytic knowledge may constitute the best individual prophylaxis against neuroses.

Gajardo was, furthermore, committed to promoting sexual education and became recognized as an expert in the field (Gajardo, 1936). He insisted on the need to recognize infantile sexuality as an element of the civilizing process and therefore encouraged sex education for children. In conjunction with a medical team, Gajardo participated in the *Centros de Educación Familiar* (Family Education Centre's) organized by the *Departamento de Higiene Social* (Department of Social Hygiene), which was aimed at implementing sex education courses for parents, teachers, and physicians. He was personally responsible for the course on "Freud's sexual theory" (Bahamonde, 1937).

Psychoanalytic heterodoxy, promoted by Gajardo, sparked a massive recruiting and teaching effort by the "Freudians": This included an open school of psychoanalysis, which made a series of essential attempts to spread psychoanalysis beyond professional circuits. Gajardo inclined, therefore, toward what was known as "lay analysis" and entered the debate by declaring that medicine could not claim an exclusive right to psychoanalytic practice. Gajardo's efforts to publicize psychoanalysis became official; along with other collaborators, he helped create the *Fundación Freud y Shenstone* (Freud and Shenstone Foundation) in 1950, which was introduced as an institution designed to promote the psychological improvement of human beings. This foundation, which functioned in Santiago, gave free, popular courses on psychoanalysis, open to anyone who cared to take them. Under the banner "Any Chilean can be a psychoanalyst," these courses were advertised in the press and were

taught at the University of Chile's Law School by Judge Gajardo (Ruperthuz, 2012, 2016, 2017).

Finally, Samuel Gajardo made a foray into the literary world, too, writing novels in which his characters starred in situations inspired by what he saw in court. Novels like *Sexual disharmony* (*Desarmonía sexual*, 1937b) and *When children don't sing* (*Cuando los niños no cantan*, 1949) show a psychoanalyst like a principal character intervening in problematic situations that affect children, interpreting the unconscious dimension of their suffering.

Argentina · Psicoanálisis · Historia de la psicología · Psicología general · Facultad de psicología

Jorge Galíndez was born in Catamarca in 1912, and he received his doctoral degree in medicine in the *Universidad de Buenos Aires* (University of Buenos Aires), where he also studied philosophy. In his native province, he was an active professor at the *Instituto del Profesorado de Enseñanza de Catamarca* (Institute for Professorship Teaching at Catamarca). He was also elected provincial deputy for the Democratic Party in 1941.

A casual conversation with Professor Edmundo Concha (1918–1998), colleague at the Institute and professor at the *Facultad de Filosofía y Letras* (Faculty of Philosophy and Humanities) at the *Universidad Nacional de Tucumán*, UNT (National University of Tucumán), made him aware that there was a position for the course on *Direcciones contemporáneas de la Psicología* (Contemporary Trends of Psychology), a required within the *Licenciatura en Filosofía* (undergraduate program in philosophy). As the situation in his province was complicated since he had been dismissed from the Institute in 1955 due to his closeness to the Peronism, he competed and obtained the professorship, moving to San Miguel de Tucumán (García, 2012).

Allí desempeñó un papel decisivo en la creación de la carrera de Psicología, que ya había sido anticipada en el Congreso de

Psicología de 1954, pero que la caída del gobierno peronista había retrasado en su implementación. Como integrante del Consejo Directivo de la Facultad de Filosofía y Letras (1959) impulsó la creación de la Licenciatura en Psicología en 1959. Asumió la Dirección del Departamento de Psicología. Junto al Prof. Ricardo Moreno y al Prof. Jorge Bianchi puede reconocérsele la autoría del proyecto.

In the National University of Tucuman, he played a decisive role in the creation of the undergraduate Psychology Program, which had already been anticipated in 1954 in the *Primer Congreso Argentino de Psicología* (First Argentine Psychology Congress), but due to the fall of the Peronist government had delayed its implementation. As a member of the *Consejo Directivo* (board of directors) of the Faculty of Philosophy and Humanities he promoted in 1959 the creation of the undergraduate Psychology Program. Together with Professors Ricardo Moreno (1912–2012) and Jorge Bianchi (1930–2021), he is credited with the authorship of the project. Later, he assumed the direction of the *Departamento de Psicología* (Department of Psychology) at UNT.

Within the undergraduate program in psychology, in addition to the course Contemporary Directions of Psychology, Galíndez taught other required courses such as *Psicología Evolutiva* (Developmental Psychology), *Psicología Médica* (Medical Psychology), *Orientación Profesional* (Professional Guidance), *Biotipología y Caracterología* (Biotypology and Characterology), and *Psicología de la Personalidad* (Personality Psychology). His teaching was effective and profound, always keeping abreast of the latest developments in his specialty.

He published two books. The first one, *El Papel del Cuerpo en la Percepción* (The Role of the Body in Perception) (Galíndez, 1963) and *Esquemas del Comportamiento* (Behavioral Schemes) (Galíndez, 1970). In the first one, he showed the influence of bodily materiality on perceptual structures; in the second, the development of various schools and trends in psychology, from associationism to behaviorism, including

important references to the thought of Merleau Ponty and Sartre, of whom he became a specialist. Galíndez also included Lacan's theories in his classes, since 1966, when the *Écrits* (Writings) were edited (Lacan, 1966). This resulted in a remarkable article published in the newspaper *La Gaceta Literaria* entitled "Mas sobre psicoanálisis?" (More over psychoanalysis) (Galíndez, 1971), in which he developed in a pertinent manner some aspects of Jacques Lacan's doctrine. Likewise, his courses given in the 1980s at the *Sociedad Psicoanalítica* (Psychoanalytic Society) and the *Colegio de Psicólogos de Tucumán* (Psychologists Board of Tucumán) on different aspects of Freudian theory are well remembered.

In the IV Argentine Congress of Psychology held in Tucumán in 1983, he asked to be presented "as an anonymous reader of Freud, in a panel that he shared with psychoanalysts" (Núñez Campero, 2006, p. 177). This was an exercise of wise irony in front of the specialists and a clear position as a reader of Freud differentiated from "official" psychoanalysis.

Other articles that deserve to be highlighted are "La Universidad en el pensamiento de Ortega y Gasset" (The University in the thought of Ortega y Gasset, Galíndez, 1962), "Dos concepciones políticas de la universidad" (Two political conceptions of the university, Galíndez, 1963) and "El viviente espíritu de la universidad" (The living spirit of the university, Galíndez, 1963). In those essays, he referred to the University in its role as a center of culture, emphasizing its difference with science and assigning to culture the role of englobing it.

It is noteworthy that Galíndez, who had initially specialized as an oculist, turned to research in the sciences of subjectivity, perhaps as a consequence of the fact that one of his sons, Francisco Galíndez, was born with a congenital and chronic motor disability that accompanied him for the rest of his life. This did not prevent him from being an outstanding poet and an acute film and theater critic, as well as a political activist. Those who knew him personally emphasized that his father played an important role in his

acceptance of his organic limitations and in his cultural development.

Jorge Galíndez distinguished himself as one of the most outstanding promoters of psychoanalysis at the beginning of the undergraduate Psychology Program at the National University of Tucumán.

Brazil · Uruguay · Argentina · PMK · Nursing

Alice Madeleine Galland de Mira, daughter of parents originally from Switzerland, lived in different countries – Uruguay (Montevideo), Argentina (Buenos Aires), and Switzerland (Geneva) – throughout her adolescence and youth, due to the professional demands of her father and her own training.

Her first contact with psychology took place at the beginning of the High School, in Buenos Aires, through the disciplines then considered scientific. However, to finish her studies, she was sent by her parents to Geneva, in order to add cultural elements to her education. On that occasion, Alice Madeleine Galland de Mira took some classes in psychology, having called her attention the one given by Maria Montessori (1870–1952), considered by Alice herself as “the great Italian pedagogue” (Oliveira, p. 92, 2009).

Alice Madeleine Galland de Mira graduated in Nursing, from Ecole du Bon Secours in Geneva, in the 1930s, returning to South America, specifically Buenos Aires, where she structured the nursing area in the maternity, gynecology, and pediatrics clinics at the Hospital Británico from Buenos Aires. On this occasion, she was contacted by the Rockefeller Foundation, which, interested in setting up a Nursing School in Argentina, recognized the singularity of Alice’s training path, considering her the most appropriate professional to act in this challenge.

She won a scholarship in Toronto, Canada, where she was able to specialize in Public Health, with a focus on disease prevention and health maintenance. After finishing her specialization, and before returning to Argentina, she stayed in New York for a few months. It is not possible, however, to specify details of this period, because Alice Mira, in a statement given at the age of 90, did not accurately recall the months and years (Alice Madeleine Galland de Mira, personal communication, October 31, 2006).

Back in Argentina, at the turn of the 1930s to the 1940s, specifically in Rosario, she was part of the pedagogical coordination of the School of Nursing, as proposed by the Rockefeller Foundation. However, the country was in a time of great political upheavals, marked by two military coups, a continuous repression of the manifestations of opposition and economic complications, and her performance in that School ended up being interrupted. In the same period, Alice Madeleine Galland visited the Hospital “Dr. Emilio Mira y López,” a psychiatric hospital located in Santa Fé, Argentina. This hospital had been founded and run by Mira y López, on account of her appointment in 1943 as Director of Psychiatric Services and Mental Hygiene in that province. According to Alice, having known the Hospital influenced her later impression on the person of Mira y López, as well as the interest in meeting him (Alice Madeleine Galland de Mira, personal communication, October 31, 2006).

Then she moved to Montevideo and, coincidentally, at the recommendation of the Argentine Minister of Health, she presented herself to Emilio Mira y López, who, in 1944, signed a contract with the Uruguayan Ministry of Education to research the “Uruguayan normotype.” From that moment, still working as a nurse, Alice Madeleine Galland de Mira had the collaboration of Emilio Mira y López when she needed help to set up nursing staff. He had come across, during the Civil War in Spain, with situations in which hospitals had been abandoned by staff and needed to select nurses quickly, thus creating contingently three specific tests that ended up also being applied by Alice in Montevideo (Galland de Mira, 2006). As the daily difficulties of Alice’s

work emerged, the contact with Mira y López intensified, so that, for Alice “love for Psychology apose from love” (Oliveira, p. 94, 2009).

Alice Madeleine Galland de Mira studied the PMK (Myokinetic Psychodiagnosis) deeply, a test developed by Mira y López and continued participating in all courses taught by Mira y López in Uruguay. They got married and, in 1947, moved to Brazil, where they stayed until the end of their lives.

When coming to Brazil, Alice Madeleine Galland de Mira became essential for the organization, systematization, and review of the works and studies by Mira y López. In the 1950s, she effectively began her professional practice at the Institute of Selection and Professional Guidance (ISOP) of the Getúlio Vargas Foundation (FGV), in Rio de Janeiro. ISOP had recognized relevance for the constitution of the Brazilian psychological space, both with regard to the training of professionals, as well as in the production and dissemination of knowledge. When working at ISOP, Alice Madeleine Galland de Mira became the great conductor of the area, giving courses in several places (including in Caracas, Venezuela, and in La Plata, Argentina), establishing herself as a competent professional and reference, as well as maintaining and enhancing the production of Mira y López.

She remained an ISOP technician until the 1980s. Throughout her work at the Institute, she published articles in the journal *Arquivos Brasileiros de Psicotécnica*. However, the publication of a book on Myokinetic Psychodiagnosis, prompted by a request from Mira y López, occurred only in 1987, setting the crowning of a lifetime dedicated to the research and application of the PMK.

Alice Madeleine Galland de Mira represents a portion of the women who contributed significantly to the dissemination of psychological knowledge in Brazil, thus contributing to its recognition as an area of study and professional practice.

Tania Mara Galli Fonseca, psychologist, professor, researcher, and extensionist, was dedicated to the training of many generations of psychologists, seeking social transformation. Her studies offered important contributions to the fields of social psychology, of labor psychology, of philosophy, of art, of madness, and of memory.

The articulation between those different fields braided her academic trajectory in a succession of experimentations which opened the horizons to new methodologies and research problems: dialectic philosophies, feminism, philosophies of difference, labor, madness, clinic, and art. Tania acquired national and international recognition both for the importance and originality of her work, and for the intensity and vibration of her thinking.

Tania graduated in psychology at Pontifícia Universidade do Rio Grande do Sul – PUCRS (Pontifical Catholic University of Rio Grande do Sul) in 1970. Throughout her training, she questioned the connection of Brazilian psychology with the civil-military dictatorship, which forged psychologists as “technocrats of human behavior” (Fonseca, 2004). Such unconformity led to her expulsion of the university. Reintegrated and graduated at the same institution, she started teaching at Universidade do Vale do Rio dos Sinos – UNISINOS (Vale do Rio dos Sinos University), in the recent created psychology course, where she worked for almost twenty years. At the same time, she presided over the Sociedade de Psicologia do Rio Grande do Sul – SPRIGS (Psychology Society of Rio Grande do Sul). She left UNISINOS in 1989 to focus exclusively on teaching at the psychology department at Universidade Federal do Rio Grande do Sul – UFRGS (Federal University of Rio Grande do Sul). She was the vice-director of Instituto de Filosofia e Ciências Humanas – IFCH (Philosophy and Humanities Institute) between 1992 and 1996. She retired in August 2003. The conjunction of her tasks as labor psychologist and university professor unfolded in her Masters’ degree under the supervision of Professor Juracy Cunegatto Marques (1931–) and, afterward, her

Doctorate in Education, supervised by Professor Guacira Lopes Louro (1945–), obtained, respectively, in 1978 and 1996 at Programa de Pós-Graduação em Educação – PPGEDU (Post-Graduation Program in Education) at UFRGS.

Her condition as a woman made her a fighter in facing sexism and homophobia. In her doctoral thesis, “Voices and Silences of the Feminine: From Woman to Worker” (Fonseca, 1996), she articulated the field of labor with the feminist discussion. The expressive force of the voices and the silencing imposed on them was an issue insisted upon by Tania in her work, thinking about the operations of oppression and resistance in the processes of subjectivation, connecting labor, madness, and art in her different works, from “Voices and Silences of the Feminine” (Fonseca, 1996) to “Lives of the Outside: Inhabitants of Silence” (Fonseca & Costa, 2010b).

The inextricability between modes of knowing and modes of subjectivizing was also an ethical goal of her practice in psychology, which configured a kind of professional and academic militancy, raised and sustained by the examination of social practices and, among them, those of science itself. Moved by these forces, she participated in the creation of the Programa de Pós-Graduação em Psicologia Social e Institucional – PPGPSI (Graduate Program in Social and Institutional Psychology) at UFRGS in 1997 as its first coordinator, remaining as a professor until her passing. Tania articulated a broad and diverse network of academic partnerships that sprouted friendship with researchers of many fields of knowledge from several regions of Brazil and abroad. In 2004, she took a postdoctoral degree at the Lisbon University (Portugal). In the same year, she was a lecturer at the Universities of Lisbon, Braga, and Coimbra.

She was the founder and coordinator of the work group Subjectivity, Knowledge, and Social Practices at Associação Nacional de Pesquisa e Pós-Graduação em Psicologia – ANPEPP (National Association of Research and Post-Graduation in Psychology).

Tania coordinated researches and interventions that resulted in new problematizations, producing, each time, unique outcomes. In the beginning of the 2000s, the project Collection of The Creativity Workshop at Hospital Psiquiátrico São Pedro – HPSP (São Pedro Psychiatric Hospital) appears with the aim of ensuring the lasting of testimonies of lives which passed through the HPSP in Porto Alegre, Rio Grande do Sul, whose marks were registered in visual and literary works.

The building of the collection was a clinical-political gesture which aimed at allowing the visibility and providing the hearing of lives and experiences which passed by the place, which originated two projects that were developed between 2009 and 2019: “Potency in Clinic of Memories of Madness” (Fonseca, 2009) and “Archive and Testimony of Infamous Lives: Insisting Reminders” (Fonseca, 2012). Her dedication to the collection at HPSP for the constitution of a memory and voice of those affected by asylum violence continues today through an extension project at UFRGS, which bears her name as a posthumous tribute: Transdisciplinary Center of Art and Madness Tania Mara Galli Fonseca.

In 2016, a project transversal to all her previous and current researches was launched: “The Endless Liminality of Experience: The Countered Quotidian” (Fonseca, 2016), a research that seems to us as an effort of conceptual systematization of the practice of an entire life, which continues as her main legacy in the following question: How to remain oneself in the threshold experience and force a new possible?

psychology

Agris Galvanovskis Kasparane, naturalized Mexican in 1984, obtained his undergraduate degree in psychology from the МГУ им. М.В. Ломоносова (Lomonosov Moscow State University) and his doctorate in Psychology from Московский институт общей и педагогической психологии (Moscow Institute of General and Educational Psychology). His undergraduate thesis, defended in 1976, was entitled “Interpersonal Relations and Group Effectiveness,” in 1976. His doctoral thesis, defended in 1982, was entitled “Relationship between Group Size and the Effectiveness of its Activity.”

Galvanovskis was a full-time professor of Psychology at the Pedagogical Institute (Higher Education) in Liepaya, Latvia (1976 to 1978), where he lectured in General Psychology, Child Psychology, and Pedagogical Psychology.

From 1981 to 1983, he worked at the Psychodiagnostic Research Laboratory, Riga Polytechnic Institute, Latvia, first as a researcher and then as its head. During this time, he studied the psychosocial aspects of academic performance and student adaptation to the Institute. In 1982, he taught social psychology at the Institute for the Advancement of Administrative Personnel in Riga, Latvia, and from 1982 to 1983 served as head of vocational guidance in the Vocational Guidance office of the Riga Ministry of Public Education, Latvia.

In 1984, he married a Mexican woman and moved to Mexico, initially as professor of Social Psychology at the Escuela Libre de Psicología de Chihuahua (Free School of Psychology in Chihuahua) (ELPAC). Between 1985 and 1986, he was professor of Psychology at the Universidad Intercontinental (Intercontinental University) (UIC) in Mexico City, lecturing in Techniques of Psychological Research in Industry and General Psychology. Between 1986 and 1989, he worked at the Universidad Autónoma Metropolitana – Unidad Iztapalapa (Metropolitan Autonomous University) (UAM) in Mexico City where he was professor and coordinator of the degree in Social Psychology.

In 1989, he became a full-time professor and head of the Department of Psychology at the Universidad de las Américas Puebla (University of the Americas – Puebla) (UDLAP), where he remained until his retirement in 2013. At this institution, he lectured in Social Psychology; Practice of Social Psychology; Psychometry; Practice of Psychometry; Quantitative Methods and Analysis I, II, and III; Learning and Memory; and History of Psychology. He also taught masters’ courses in Human Communication, Research Methods and Advanced Statistics, Research Designs and Data Interpretation, and Theories and Systems in Psychology and Psychological Measurement, as well as doctoral courses in Advanced Quantitative Methods. During his time at the University of the Americas, Puebla, Galvanovskis served over 15 years as Department Chair and coordinated the Master’s Degree in Clinical Psychology.

Galvanovskis published with social, organizational, and educational psychology, on topics including quality of life, retirement, and old age, among others. He participated in research projects financed by Consejo Nacional de Ciencia y Tecnología (National Council of Science and Technology) (CONACYT), UDLA Puebla. Galvanovskis made over 60 national and international presentations on learning patterns, retirement, quality of life, research methodology, locus of control, cognitive processes, assertiveness and emotional intelligence, family issues, avoidance of success, religiosity, and sense of life.

Galvanovskis fluently spoke Spanish, Latvian, Russian, and English. In addition to his research legacy and his quality as a teacher, Galvanovskis contributed greatly to the teaching and research of Scientific Psychology, promoting these values in his students and colleagues, being an expert in research methodology and statistics for Social Sciences. We remember him as an optimistic person who reflected his good humor.

²Universidade de São Paulo, São Paulo, Brazil

Keywords

Brazil · Philosophical psychology · Krause's system · Humanism

This intellectual who graduated from the Law Faculty (SP) in 1860 has become the main representative of Philosophical Psychology in Brazil. He was a philosophy professor at Colégio da Glória and at the Law Faculty, in São Paulo, as from 1870. Bueno is the author of *Notions of philosophy accomodated to Krause system and extracted from the philosophical Works of Tinberghien e Ahrens*, whose main objective was “to formulate in miniature Krause’s great system” (Galvão Bueno, 1877, p. II). This work consists of a successive record of the classes taught by Galvão Bueno and represents the concerns of the professors of the Law Faculty with offering compendiums explicitly intended for their students. This is also the case for Avellar Brotero

(1798–1873), author of the work “*Principles of Natural Law*” (1829), and for Francisco de Monte Alverne (1784–1858), who organized the “*Compendium of Philosophy*” (1859). All of them were professors of “Rational and Moral Philosophy”.

In the nineteenth century, “psychology” appears as part of disciplines from different areas of human knowledge, such as philosophy, law, medicine and theology. The types of psychological knowledge we find in texts of a philosophical nature can be classified into three fundamental stages in the course of that century. In the first stage, a Philosophical Psychology based on the doctrines of the French sensualist school predominates. This Philosophical Psychology was disseminated throughout the São Paulo Law School by Professor Avellar Botero (1798–1873), who, based on the work of the French Enlightenment, designates the study of the intellectual, affective, and moral faculties that resonate in the human consciousness and in the historical vicissitudes as “human science”.

Around 1840, a new stage was inaugurated, characterized by eclectic spiritualism, introduced by Francisco de Monte Alverne. It presents psychology as the study of the human spirit, with the desire to observe and classify the dynamisms of intellectual, moral, and social life. On the other hand, “psychology,” taught by Bueno at the Law Faculty of São Paulo, is part of the third stage of evolution in philosophical psychology teaching in the nineteenth century, with classes inspired by the system of the philosopher Karl Christian Krause (1751–1831). As highlighted in research (Massimi, 1989, 1990, 2016), this doctrine was a spiritualist version of classical German idealism, steeped in social and political ideals of Masonic humanitarianism. Galvão Bueno’s philosophical psychology has a humanist anthropological basis that can be seen in the titles and parts of his work, which is subdivided into “Individual Psychology” and “General Psychology”. The philosophical option adopted through Krausian pantheism can be interpreted in the context of psychology as a clear rejection of Cartesian dualism (Massimi, 1989).

The perspective of humanist and social teaching, in Krause’s horizon, allowed Bueno to

investigate the relationships among the soul and the concrete determinations of the human self in the scope of character, sexuality, will, temperaments, and aptitudes. It is interesting to note that the first chapter of *Notions of philosophy* is occupied by an extensive discussion on Psychology. Basically, in this work, Psychology is subdivided into Individual Psychology, which has as its object the soul itself, and General Psychology, in which the relationship of the soul with the other dimensions of the human being is described from its concrete faculties. On the basis of the definitions and classifications proposed by Bueno, a concern over studying the human being in his or her complex structure can be identified. The author develops a broad reflection on the concept of character, defining it as a way of being and acting that results from culture, thought, feeling, will, and the result of the activity of the human spirit. By rejecting the Cartesian dualism, Galvão Bueno understands the human being in his or her corporeal and spiritual dimension. Thus, we have, within the Brazilian culture, a plural exposition regarding the meaning of the term Psychology, guided by the requirement of an interdisciplinary approach, as stated by Bueno: “Knowledge about men is not obtained by the separate study of psychology and somatology, because in matter of organization, the whole is not only the sum of the parts, it is also foundation and union” (Galvão Bueno, 1877, p. 79). This investigative attitude, which, in turn, characterized Bueno’s method of Philosophical Psychology, allowed, on the one hand, to expand the use of specific terms to designate psychological knowledge and, on the other hand, to arouse interest in the dynamic aspect of the psychic principle.

The study of human subjectivity issues that appears in the treatise on the soul of the philosopher and lawyer Galvão Bueno was presented as a propaedeutic theory for legal practice and, for this reason, was part of the teaching curricula of the Law Faculty of São Paulo. As a matter of fact, the book “*Notions of philosophy*” (1877) is a clear example that allows us to understand how – in the nineteenth century in Brazil – knowledge from other areas, such as psychology, logic, and morals, was transmitted through the teaching of treatises

on philosophy. Thus, by reading this book and other treatises by Brazilian intellectuals who exercised teaching functions in institutions of higher and secondary education in the main Brazilian cities, we can retrace the evolution of the teaching of psychological knowledge in this and other law schools. Likewise, in medical treatises, the study of psychological phenomena is based on preparing physicians for the exercise of the “moral therapy,” which consists in an attempt to achieve a full and complex understanding of the human being. The young and talented professor Bueno had his life tragically cut short during a fishing trip and died on May 24, 1883.

Bueno’s contribution to the history of psychology in Brazil, therefore, is directly related to his concern with studying the human being, through an interdisciplinary approach, and no longer purely from a metaphysical point of view. Another fundamental element is related to his desire to deepen the use of specific terms to designate psychological knowledge and its dynamism. In this horizon, through these philosophical schools, which in the nineteenth century dealt with the meanings of the term Psychology and its multiple meanings, it was possible to formulate more critical considerations, which favored, for example, the interest in the dynamic aspect of the psychic principle.

Mexico · Psychiatry · Psychopedagogy · Educational psychology

He studied Medicine at the Facultad de Medicina (Faculty of Medicine) of the Universidad de Guadalajara (University of Guadalajara) (UdeG), as part of the 1941–1947 generation. He obtained his academic degree with the thesis “Tests of Sensitivity to Penicillin.” Later, he completed a medical residency in Internal Medicine (1948) and another in Psychiatry (1948–1950), both at the Hospital Civil de Guadalajara (Guadalajara Civil Hospital). He also carried out a series of postgraduate courses at the Escuela de Graduados (Graduate School) of the UdeG, all related to the field of Psychology: “Adolescent Psychology and Psychopathology,” “Psychotherapy and Psychotherapeutic Techniques,” “Workshop Course on Training in Mental Health,” “Refresher Course in Projective Techniques,” and “Prevention, Treatment, and Legal Aspects of Drug Dependence.” He was also certified by the Consejo Mexicano de Psiquiatría A.C. (Mexican Council of Psychiatry A.C.) as a specialist in psychiatry in November 1973.

García Álvarez held various administrative and managerial positions, among which the following stand out, director of the Psychology Laboratory

of the GHARMA group (1960–1968), an independent group for scientific research and experimentation, a pioneer in the West of the country, of which he was also a co-founder in 1959. The GHARMA group (whose name is probably an acrostic of the initials of the founders) was created by a group of psychiatrists to investigate and experiment with the action of psychotropic drugs, as well as to improve the clinical treatment of psychiatric patients, seeking at all times a more humane treatment.

He was also an organizational secretary of the Organizing Committee of the VI Asamblea de la Liga Mexicana de Salud Mental (Assembly of the Mexican League for Mental Health) (May 1955), as well as technical advisor to the Departamento de Higiene Mental (Department of Mental Hygiene) of the Centro de Salud Número 3 “Dr. Pablo Gutiérrez” (Health Center No. 3) (1972). From 1978 to 1983, he was director of the Escuela de Trabajo Social (School of Social Work) at the UdeG.

He participated as a member and founder of different associations such as the Sociedad Jalisciense de Neuropsiquiatría (Jalisciense Society of Neuropsychiatry) in 1956, the Sociedad Mexicana de Neurología y Psiquiatría (Mexican Society of Neurology and Psychiatry), and the Asociación Psiquiátrica Mexicana A.C. (Mexican Psychiatric Association A.C.). In the same way, he was an adherent member of the Asociación Mexicana de Psiquiatría Infantil (Mexican Association of Child Psychiatry) in 1973.

García Álvarez was a doctor who showed great interest in social issues and who valued education as a privileged means to address them. Proof of this is his outstanding facet as a creator of educational institutions. In 1960, he participated in the foundation of the Escuela de Psicología (School of Psychology) of the Instituto Tecnológico y de Estudios Superiores de Occidente (The Institute of Technology and Higher Studies of the West) (ITESO), which was the third school of Psychology to be founded in the country and the first outside the Federal District and, of course, of Jalisco. There he gave classes of Psychometry and Abnormal Psychology for several years.

Previously, he had also participated in the founding of the Escuela de Trabajo Social (School of Social Work) (1953), the Facultad de Filosofía (Faculty of Philosophy) (1955), as well as the Escuela Preparatoria No. 2 (Preparatory School No. 2) (1962), all of them dependent on the UdeG. Likewise, in 1966, he participated in the founding of the Escuela Normal Superior de Jalisco (Higher Normal School of Jalisco), dependent on the Departamento de Educación Pública del Estado (State Department of Public Education), where he taught Adolescent Psychology.

Special mention deserves the crucial role of García Álvarez in the founding of the Escuela de Psicología (School of Psychology) of the UdeG. In an interview with Dr. Sergio Villaseñor Bayardo (2006), which is part of the book *Voces de la Psiquiatría* (Voices of Psychiatry), García Álvarez himself narrates the circumstances of the creation of the school:

I was the director of the Departamento Psicopedagógico (Psychopedagogical Department) of the university, and the rector of the university was Lic. Rafael García de Quevedo, who had been a disciple of mine in the Preparatoria (High School) of Jalisco. The rector called me and said: “Hey, I called you because I want to know your opinion. What do you think if we found the School of Psychology? Who would you advise me?” I replied: “I suggest that we bring together all the doctors who are teaching psychology at the UdeG and develop our study plan.” “Sounds great to me,” he said. So, I made my list, and on that commission were Wenceslao Orozco y Sevilla, López Almaraz, Enrique García Ruiz. They were the five psychiatrists that we were teaching at the time because there were no psychologists. The psychologists that were there were from ITESO, because they created their Facultad de Psicología (Faculty of Psychology) before the UdeG. (...) Then we had several sessions, and we elaborated the study plan, and Wenceslao Orozco was proposed as the director because he was the most respectable, the greatest, the most experienced (Villaseñor, 2006, pp. 35–36).

In that commission, García Álvarez, as secretary, was in charge of coordinating the technical work on the proposed study plan. The members, in addition to Wenceslao Orozco y Sevilla, were Dr. Carlos Corona Ibarra (1919–2006), Dr. Enrique García Ruiz (1910–1994), Dr. Raúl López Almaraz (1934–?), and Dr. Enrique Estrada

Faudón (1927–2013), all of them important psychiatrists of the time. The commission was formed on April 3, 1973, and the project for the creation of a degree in Psychology was presented to the rector in June 1974, being discussed and approved by the Honorable Consejo General Universitario (Honorable General University Council) on July 15, 1974, taking office the next year.

On the other hand, he was director of the Instituto de Psicopedagogía del Departamento de Educación Pública del Estado (Institute of Psychopedagogy of the Department of Public Education of the State) from 1965 to 1970 and of the Departamento Psicopedagógico (Psychopedagogical Department) of the UdeG, of which he was secretary from 1952 and director from 1972 until the beginning of the 1980s in various periods.

Part of his research work focused on studying dyslexia in children with this disorder in the City of Guadalajara, Jalisco, Mexico, work that led him to obtain the Premio Jalisco (Jalisco Prize) (1967).

His publications include his book on vocational guidance, published at the end of the 1970s, with a second edition 10 years later, aimed at high school students.

García Álvarez received a large number of recognitions, highlighting the following: the medal awarded by the Escuela Normal de Jalisco (Normal School of Jalisco) for his teaching work; a diploma conferred by the Consejo Mexicano de Psiquiatría (Mexican Council of Psychiatry); the medal awarded by the Board of Directors of the Sociedad Jalisciense de Neuropsiquiatría (Jalisco Neuropsychiatry Society), for being a founding member; the diploma of the Asociación Mexicana de Psiquiatría Infantil A.C. (Mexican Association of Child Psychiatry A.C.) accrediting him as an adherent member; the recognition as a founding member granted by the Asociación Psiquiátrica Mexicana (Mexican Psychiatric Association); and the recognition granted by the Asociación Psiquiátrica de Jalisco, Colegio Médico, A.C. (Jalisco Psychiatric Association, Medical Board, A.C.) as “Pioneer of Psychiatry in Jalisco.” From the UdeG, he received the “October 12” award for his career and from the Departamento

de Educación Pública del Estado de Jalisco (Department of Public Education of the State) the “Manuel López Cotilla” medal for 30 years of teaching work.

García Álvarez described himself as a neurotic whose obsession was work. He was part of the University of Guadalajara for 40 years and prided himself on not having missed his classes just once.

Marion García is the oldest child of Armando García Soltero, a general physician, and María Nicanora (Moneta, Monita, Nona) Castillo Pietri, a housewife. Both parents came from Guayama, Puerto Rico, but were living in Philadelphia, USA, while the father was in medical school.

When she was born, she was named Josefa Marion, but she rarely used her first name. She had two sisters, Diana María and Victoria Virginia, and two brothers, Armando and Fabio.

Marion García grew up in Philadelphia, Juana Díaz, and Guayama where her family finally settled circa 1930. She lived in a high middle-class household with her parents, four siblings, occasionally some cousins, and two servants. Her father was the town's doctor, and the family was well respected (E. Nazario Velasco, personal communication, September 10, 2020). Education was an important value for her family, and she was stimulated to study, as were her siblings. Eventually all of her siblings graduated from college and some obtained higher degrees. She studied in the public schools of Juana Díaz and Guayama, where she graduated from High School in 1932 (Personnel Record, Marion García, 1945–1974). She went to Wilson College in Pennsylvania and later transferred to the University of Puerto Rico in Río Piedras (UPR-RP) where, in 1937, she earned a bachelor's degree in Science (APPR, 1970).

From 1938 to 1943, Marion García started teaching Chemistry and General Science in the public high schools of San Germán, Mayagüez, and Coamo. She also taught Biology and Geometry (Personnel Record, Marion García, 1945–1974). After a few years, motivated by her desire to prepare herself better for the benefit of her pupils, she decided to continue her education at the graduate level. She moved to New York, USA, in 1943 and enrolled in a master's degree in Educational Psychology at Columbia University, degree she obtained in 1945. Teachers College of Columbia University, at that time, was one of the most prestigious universities in the area of education in the USA and a center of functionalist Psychology (Álvarez, 2006).

Marion García started working at the College of Education of UPR-RP in 1945, where she remained until her retirement in the late 1970s. She taught several courses to students of education, among them, Developmental and Educational Psychology. She was aware of her important role in the future of Puerto Rico, as her students would be the future teachers of

generations of Puerto Rican children. Her arrival at the College of Education coincided with the structural reform of UPR-RP in 1943 where the College of Arts and Sciences was divided into three new colleges: College of Humanities, College of Natural Sciences, and College of Social Sciences. Most of the Psychology courses that used to be offered in the College of Education were now offered at the new College of Social Sciences, but a few new courses were added at the College of Education, like Measurement and Evaluation for Elementary School and Measurement and Evaluation for Secondary School (Álvarez, 2006; Roca de Torres et al., 2003).

After a few years of teaching in the College of Education, Marion García decided to return to Columbia University to finish her doctoral degree. She obtained her EdD in 1953 specializing in Developmental Psychology and Mental Health. Once graduated, she returned to her tenured position at UPR-RP and to Puerto Rico with new ideas and new enthusiasm. She was very active offering lectures to community organizations about development of children and adolescents, intelligence, specific problems during adolescence, emotions, mental deficiency, personality problems, and adjustment to work and human relations, among others. She also studied the problems of Puerto Ricans residing in New York City and the adjustment and course preferences of first year students of Normal College (Personnel Record, Marion García, 1945–1974).

Marion García was among the founding members of the Puerto Rico Psychology Association (APPR, in Spanish) in 1954, the secretary of its first Board of Directors, the vice-president of the Second Board, and the third president from 1956 to 1957 (Roca de Torres, 2006). From 1954 until the late 1970s, she was very active in APPR doing committee work and participating in all kinds of activities. During her year as president of APPR, she was chair of the IV Interamerican Congress of Psychology, under the auspices of Interamerican Society of Psychology (ISP) and UPR-RP, which was celebrated in San Juan Puerto Rico (Roca de Torres, 2006). The president of ISP that year was Otto Klineberg (1899–1992), a Canadian social psychologist who was professor at Columbia

University and at the University of Paris and studied intelligence across races and whose research was crucial in winning the racial segregation case of the Supreme Court of the USA, *Brown v. Board of Education* in 1954.

Marion García was a member of several professional associations: Puerto Rico Teachers Association; Puerto Rico Psychology Association (APPR); Interamerican Society of Psychology (ISP); American Psychological Association (APA); Pi Lambda Theta and Kappa Delta Pi, two honorary professional associations of education; National Vocational Guidance Association; and International House World Organisation, an association of language educators (Personnel Record, Marion García, 1945–1970). From the 1950s to the 1970s, she was very active in APPR and ISP, attending their conventions, participating in committee work, and presenting papers. Along with her husband, psychologist and professor, Ramón Ramírez López, married circa 1956, she represented APPR and UPR-RP at the VI Congress of Interamerican Psychology, celebrated in Rio de Janeiro, Brazil, in 1959 (Boulon-Díaz, 2012). They not only traveled to congresses and meetings of ISP and APA; they also went to visit universities in México and informally meet with their students and faculty. She used to give presentations about students' attitudes and study habits, about college guidance, and about the role of Psychology in our society. In collaboration with her husband, she translated to Spanish an important US textbook of Developmental Psychology.

Throughout the years, APPR recognized the contributions of its founders and past presidents, the Ramírez García couple among them, as follows: in 1972 by honoring its past presidents, in 1987 by dedicating the Convention to Pioneers in Psychology, in 1994 by dedicating its Convention to APPR founders, and in 2003 by dedicating the 50th Anniversary Convention to their past presidents.

During the summers of 1965 and 1966, Marion was a Visiting Professor at the University of Wisconsin. Here she taught courses in her area of expertise, Developmental and Educational Psychology, and shared her experiences about Puerto

Rico. She retired from UPR-RP in 1973 after teaching for 29 years and having attained the rank of full professor (Personnel Record, Marion García, 1945–1974).

APPR and UPR-RP have to be very grateful to pioneers like Marion García de Ramírez who helped set strong institutional bases. In the 1950s, APPR used to be an emerging organization, simply structured with around 60 members. Today, it has more than a thousand members and many committees, employees, and volunteers. The profession of teacher in Puerto Rico has continued to grow, and the Faculty of Education is one of the institutions that graduates most teachers.

Professor of Normal and Special High Education in Philosophy, by the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities of the University of Buenos Aires, UBA). In 1939 he obtained his PhD at that University, in the Sección de Psicología del Instituto de Filosofía (Institute of Philosophy, Psychology Section). His dissertation, *Ensayo sobre la teoría de inteligencia de Spearman* (Essay on Spearman's theory of intelligence) was published and awarded the Carlos Bunge Prize in 1949. He acknowledged himself as a student of Coriolano Alberini (1886–1960) and Juan Luis Guerrero (1899–1957).

In 1940 he moved to the Universidad Nacional de Cuyo (National University of Cuyo) where he worked as Assistant Professor in Psychology and Introduction to Philosophy. In 1941 he became Professor in both subjects and also in History of Modern Philosophy, until 1946. In the chair of

psychology, he dealt with mental life and its characteristics and studied in detail the modern systems of psychology: comprehensive, structural, psychology of the unconscious. In the teaching of the subject, an excellent mastery of the topics and updated bibliography was observed, as well as the skillful use of abundant exemplification, always oriented to the concrete experiences of his listeners (Pró, 1987). During 1943, he collaborated with Horacio Rimoldi (1913–2006) in the course Psychology II. He was a Member of the Academic Board and Vice-Dean of the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) of National University of Cuyo.

In 1946 he returned to Buenos Aires. He was appointed Professor of Psychology at the Universidad de La Plata (University of La Plata) and Professor of Psychology II at the Universidad de Buenos Aires (University of Buenos Aires, UBA). He became Full Professor in July of 1947, where he remained until 1956, at the same time that Eugenio Pucciarelli (1907–1995), won the Chair of Psychology I.

Between 1947 and 1956, he was also Director of the Institute of Psychology, at the Faculty of Philosophy and Humanities (UBA). There he created the academic publication *Monografías Psicológicas* (Psychology Monographs), which published 10 issues. He resigned in 1957 when the Psychology Department was intervened by the new government (Rossi de Cerviño, 1990).

From 1963 to 1967, he was Extraordinary Professor of Adolescence at the Universidad del Salvador (University of Salvador). From 1967 to 1973, he became Professor of History of Psychology at the Psychology Program, Faculty of Philosophy and Humanities, University of Buenos Aires. Between 1967 and 1977, he was also Regular Professor of General Psychology III at the Faculty of Humanities of the University of La Plata, where he developed his outstanding program on *The Young Freud* (Rossi, 1997).

At the First International Congress of Philosophy, held in 1949, in the province of Mendoza, Cuyo, he presented the paper *La Crisis de la Psicología y la teoría de la forma* (The Crisis of Psychology and the Theory of Form). It represented a key text, in a philosophical

environment, in which he argued that psychology should be differentiated from philosophy on the basis of the Kantian argument: “psychology has reached the maturity age” (García de Onrubia, 1950, p. 1371). This position was endorsed by his teacher Juan Luis Guerrero (1899–1957), who was the Secretary of Proceedings of the Congress. At the same event, Eugenio Pucciarelli introduced Felix Krueger (1874–1948), who was the first Professor of the course of Psychology II at the University of Buenos Aires, and highlighted the significance of his contribution to Psychology.

The syllabus for the course of Psychology II at the University of Buenos Aires taught by García de Onrubia, included since 1947 Psychometry subjects, strengthened by the presence of Nuria Cortada (1921–2013). In those courses, he presented a contemporary approach focused on Dynamics in psychology. Subjects and authors of the European postwar period were included: the concept of psychological vital field of Kurt Lewin (1890–1947) from Gestalt, the *Tiefenpsychologie* from psychoanalysis, the psychological perspectivism of Maurice Merleau-Ponty (1908–1961), and the humanistic conception of existentialism from Jean Paul Sartre (1905–1980). He also incorporated from American authors such as William McDougall (1911–1938) his intrinsic teleology (Rossi, 1990).

With Nuria Cortada, he worked on the typification of the Rotter Incomplete Sentences Blank test for an Argentine population (Cortada et al., 1954). Thereafter, they inaugurated a collection of clinical psychology and psychodiagnosis that anticipated professional tendencies of developmental psychology and psychodiagnosis.

In 1954 he presented a proposal for the creation of a Psychology Program, which was rejected by the Academic Board. The same year, he published *Fenomenología de la emoción. Notas críticas sobre la teoría de Sartre* (Phenomenology of Emotion. Critical notes on Sartre’s theory) (García de Onrubia, 1954). In 1953 he had published his paper *Psicología Intencional* (Intentional Psychology) which contained the *Psicología del Acto y Psicología del contenido*

(Psychology of the Act and Psychology of the content) (García de Onrubia, 1953). In 1958 he published *Aspectos psicosociales de la minoridad* (Psychosocial dimensions of minorities) in the journal *Acta Neuropsiquiátrica Argentina*. In that year, he was appointed Head of the Psychology Department of the Consejo Nacional de Protección de Menores (National Council for Child Protection), where he worked from 1958 to 1966. He received a scholarship from the U.S. State Department to study the systems of recovery of juvenile delinquents.

In 1968 he presented the paper *El dualismo en la psicología de la expresión* (Dualism in psychology of expression) at the Jornadas Argentinas de Rorschach clínico (Argentinean Clinical Rorschach Conference) and published *Epistemología de la Gestaltheorie* (Gestalt Theory epistemology) (García de Onrubia, 1971).

In his long career, he was the author of many academic syllabus, courses, and papers. He was also a founding member of the Interamerican Society of Psychology (SIP). Between 1976 and 1977, he became representative of the Psychology Program in the Rectorship of the University of Buenos Aires.

Keywords

Cuba · Rorschach · Child psychology ·
Psychodiagnosis

Daughter of a Cuban diplomatic, being a child, she returned to Cuba with her family. She did her first studies in Havana and entered in the Escuela de Educación de la Universidad de La Habana (School of Education of the University of Havana), where she graduated with excellent results. Starting from here began her career as a professor. She took possession of the category of Instructor of the Course of Pedagogical Psychology on the School of Education of the University of Havana in 1928 and position that was ratified in 1929 and in 1930. On May 1934, she was authorized to take charge of the Chair of Pedagogic Psychology and School Hygiene, while in the same year the University Council designated her Auxiliary Interim (by competition) Professor of the course of Pedagogic Psychology and School Hygiene. On April 1938, designated Auxiliary (in property) Professor while on May 1941 she became Full Professor of the School of Education. On April 1946, she occupied the position of Vice dean of the Faculty of Education and on January 1955 she was granted with the special educational category “Emérita.” In that academic context, the Professor García Herrera carried out, among other important functions, that of president of the Tribunals of the Exercises of Competition-opposition in the Faculty of Education of the University of Havana (Dueñas, 2002).

In 1935, seven years after her arrival to this Faculty, she traveled to the city of Chicago, USA, where she carried out studies related with her profession. In the summer of 1942, she returned

to the United States, where she attended the specialization course on the psychodiagnosis of the personality by the Rorschach method and taught in the Institute Rorschach of New York by Bruno Klopfer (1900–1971), professor of the University of Columbia (Alonso et al., 2001; Alonso & Colli, 2001).

In 1944, she returned to the United States with the purpose of acquiring material for the Rorschach Seminar that she conducted at the University of Havana, and in the summer of 1948, she traveled again to North America, and then to Mexico, DF, where she revised studies related with the activities of the denominated schools of the UNESCO. In 1950, she obtained the degree Master of Arts, granted by the Teachers College of the University of Columbia (Dueñas, 2002).

In 1952 and 1954, she visited European countries, where she attended studies related with the course she taught; in 1956, she received a special invitation of the Escuela Nacional de Anormales (National School of Abnormal) in Madrid, Spain, to carry out studies that required the application of the most modern projective technics (included, of course, the Psychodiagnosis of Rorschach) (Pardillo & Fernández, 2001).

The Professor García Herrera attended, as official delegate of the Faculty of Education of the University of Havana, the *III Interamerican Conference of Education*, celebrated on August 1937, in Mexico City, where she presented the reports: “Necessity of the creation of an Psychopedagogical Institute for the study of Cuban child and adolescent”; “The rhythm in the initiation of learning of writing, and proposal for a permanent plan of desanalfabetización (sic) of adults in urban and rural centers.” She also represented the University of Havana in the *Congress of Technical Teaching*, in June 1939 in Berlin, Germany; in the *Defective Boy’s International Congress*, developed in 1939 in Geneva, Switzerland; in the *II Conference of the Organization of the United Nations for the Education, the Science and the Culture*, in 1947, in Mexico City; and in the *XIII International Congress of Psychology* that took place in 1951 in Stockholm, Sweden.

García Herrera was member of the Colegio Nacional de Pedagogos (National Society of

Educators), of the Consejo Superior de Defensa Social (Superior Council of Social Defense), and of the Academia Nacional de Ciencias de México (National Academy of Sciences of Mexico). In the last institution, she presented a reception speech, with the title “The therapeutic pedagogy in the prevention of the nervous and mental illnesses.” After more than 30 years of absolute dedication to the university teaching, the doctor Aurora García Herrera requested the civil retirement and consequently, gave up the position of Professor “Emérito” from the Faculty of Education of the University of Havana. Later, she asked for the resignation which was accepted by the Rector after the acknowledge of her undoubted scientific-pedagogical merits.

The documents she elaborated and the reports of her studies constituted a valuable referent for the Cuban psychologists. She is recognized as the professional who introduced in the Cuban Psychology the most updated psychodiagnosis techniques of their time, which continues in use, especially, the technique of Rorschach psychodiagnosis (Dueñas & Colli, 2003; Dueñas & Pardillo, 2001). Also, she is recognized as the teacher who prepared the first specialists in the psychological and pedagogical attention to children with special needs.

José María García Madrid has been a hidden figure under the great shadow of Mercedes Rodrigo Bellido, but a glance at his work is enough to realize that his figure and his work deserve a place that so far, the history of the behavioral sciences has overlooked. José worked at the National Institute of Psychotechnics of Madrid where he met Mercedes Rodrigo and became her assistant, and they consolidated a friendship that would last a lifetime. It was so that José left Spain with Mercedes and her sister, María Rodrigo (1888–1967), at the end of the Spanish Civil War when the beginning of Franco's

regime threatened the lives of republicans, socialists, and democrats.

Partly thanks to the contacts that Mercedes Rodrigo had in Switzerland, at the Rousseau Institute, she, her sister María, and José García Madrid managed to escape Franco's regime by proving that they had to leave the country for work, avoiding being taken to a concentration camp (Ana María García Blanco, personal communication, July 29, 2020).

After a brief stay in Switzerland, Mercedes, María, and José traveled to Colombia in 1939, invited by Agustín Nieto Caballero, rector of the Universidad Nacional de Colombia (National University of Colombia). And it was at the National University where Mercedes and José found a niche to develop their academic careers for the next decade. In the Faculty of Medicine of the National University of Colombia, José obtained a title as Doctor of Medicine and Surgery in 1950. At the same time that he was studying medicine, he continued working with Mercedes Rodrigo as deputy director in the Psychotechnics Section of the Medicine Faculty (Rodrigo, García Madrid, and Esguerra Gómez, 1946), where they adapted several tests, such as the Yerkes test, the Army Alpha test, the Scholastic Aptitude Test for Medical School, and the attention test of Toulouse-Piéron, among others (Hernández-Vargas, Valencia-Lara, and Rodríguez-Valderrama, 2002). When the Psychotechnics Section became the Institute of Applied Psychology, in 1948, García Madrid was also appointed as sub-director. Also, during this time, he started to work in children psychiatry and at the Frenocomio de Mujeres (Female Hospice) in Bogotá (Herrero González, 2003, p. 272).

One of his biggest contributions in Colombia was the foundation of the García Madrid Institute for abnormal children, the first of its class in Colombia and also one of the first institutions in clinical psychology in the country (Martínez Gorroño, 1990, p. 94; 1999, p. 24 cited in Herrero González, 2003). Ran by José García Madrid and Mercedes Rodrigo, the institute was located on the ground floor of the house where they lived, and it worked for about six or eight years. In addition to Mercedes and José, other young

exiles, such as Ascensión Madariaga, Carmen Mayoral, and Virginia Mayoral, worked there as teaching staff (Herrero González, 2003, p. 351).

The political changes in Colombia that led to the rise of the conservative party to the government in 1946 began to make the situation of the Spanish immigrants difficult, and their situation became unsustainable when the government of Laureano Gómez, a recognized admirer of Franco, began in 1950. Due to the attacks on Mercedes Rodrigo's work – who was branded as a communist and accused of favoring communists in the admission exam to the National University – and the uncertainty that Spanish Republican immigrants were facing in Colombia under the conservative regime, José García Madrid, Mercedes Rodrigo, and María Rodrigo decided to emigrate once again (Ana María García Blanco, personal communication, October 9, 2020).

Their plan was traveling together to the United States, but initially, only José García managed to obtain a passport to travel, so he traveled first with the idea of preparing the ground for Mercedes and María to join him. On his way to the United States, however, José passed through Puerto Rico. There he found a very solid community of Spanish immigrants and an open-minded government that was trying to modernize the country and, as had happened in Colombia a decade earlier, was welcoming the exiles of the Spanish Civil War to help in that purpose. Puerto Rico seemed like an ideal place, it had great conditions for them as immigrants, and also it was a Spanish-speaking place very close to the United States, so José decided to stay there and establish there with María and Mercedes Rodrigo.

The Spanish exile community in Puerto Rico had renowned people as Federico de Onís (1885–1966), Pablo Casals (1876–1973), and the famous Spanish poet Juan Ramón Jiménez (1881–1958), among others, who were close with a cultured circle of Puerto Rican society – related, for example, with the writer Tomás Blanco (1886–1975) – who welcomed José García and the Rodrigo sisters. Since his arrival, José García Madrid became the psychiatrist of Juan Ramón Jiménez, and he was increasingly recognized by his community. It was in Puerto Rico, then, where José García Madrid developed

his professional career in psychiatry and psychotherapy and where he lived until his death.

At his arrival, José García was hired by Jaime Benítez (1908–2001) to teach at the University of Puerto Rico, where he was in charge of psychiatry lectures. Shortly after, he started to work at the Psychiatric Hospital of Puerto Rico, where he worked for several years and where he may have made his biggest contribution to the field.

In the 1950s, the public system in mental health in Puerto Rico was still very poorly developed, and the psychiatric techniques were based on locking patients up, under strong medication, and electroshock therapy. It was García Madrid who first introduced modern therapies for mental health. As the headmaster of the Psychiatric Hospital, he developed community treatments, and he built a farm within the hospital to involve patients in farm work, fostering coordination between patients and working outdoors as part of their treatment.

In Puerto Rico, José García Madrid met Maria Teresa Blanco Cesteros (1920–2009), an educated teacher who worked with vulnerable communities. For both of them, it was a case of love at first sight, and they got married on September 10, 1953. Shortly after the wedding, José and Maria Teresa traveled to the United States to Philadelphia, where José validated his title as physician and psychiatrist in order to continue practicing medicine and psychiatry. After this stay in Philadelphia, José García returned to Puerto Rico to his work in the Psychiatric Hospital where he continued to develop his innovative ideas.

Shortly after, when they were devoted to the work at the Psychiatric Hospital, José and Maria Teresa had their first two children, Mariano (1955) and Ana María (1956). Several years later, the whole family traveled to Boston, where José made a specialty in children psychiatry and their third child, José María (1960) was born. José's family remained close to Maria and Mercedes Rodrigo, who developed their own careers in music and psychology, making great contributions to Puerto Rican society. Maria played a very important role in the musical scene in the island because she helped the Spanish cellist Pablo Casals to establish the modern

conservatoire in Puerto Rico (Ana María García Blanco, personal communication, July 29, 2020). Mercedes continued her career as a clinical psychologist and helped to the institutionalization of the discipline on the island.

Before his retirement, José started to work in the hospital for the elderly, where he finished his career. José García Madrid died in San Juan on May 31, 1992, surrounded by his family after a life dedicated to helping others. His support of Mercedes Rodrigo's work was decisive for the beginning of institutional psychology in Colombia, and his own contributions as a practitioner as well as a teacher of psychiatry in Puerto Rico were of the utmost importance for the discipline and promotion of mental health in that country.

Rafael Alfredo García Palmieri was the second of three children of a modest family formed by Rafael García Borregón, a teacher, and his wife, Mercedes Palmieri Ferri, a housekeeper. Rafael attended grammar school in his hometown, but since there was no high school in Adjuntas, his family moved to Aguadilla for Rafael Alfredo and his two siblings to continue their education.

Rafael García Palmieri graduated from high school at age 16 in Aguadilla in 1942 and was admitted with a scholarship to the University of Puerto Rico, Río Piedras Campus (UPR-RP). At the time, and due to the schoolteacher's shortage during the war period, he was part of a group of college students who became teachers in the public school system of the island while completing their degrees. From 1944 to 1951, he taught at the elementary, junior, and high school levels. In 1951 he finished a Bachelor of Arts degree (*Magna Cum Laude*) with a concentration in psychology and a professional diploma in industrial arts education both from the University of Puerto Rico. From 1951 to 1952 he worked as a psychologist and general supervisor for the Department of Education of Puerto Rico, formerly the Department of Public Instruction.

In 1952 Doctor García Palmieri was awarded a scholarship by the University of Puerto Rico for graduate studies toward a Master of Arts degree in psychology which he completed at George

Washington University in Washington, DC, in 1954. Upon his return to Puerto Rico, he worked as a psychologist at the Office of Research and Statistics of the Department of Education and as a psychologist and instructor of psychology at the University of Puerto Rico. In addition to this, he was the director of the Student Guidance Office at the Office of the Dean of Students of the Mayagüez Campus of the University of Puerto Rico. During 1955–1957 he also worked as psychologist for the Puerto Rico Aqueduct and Sewer Authority, formerly the Puerto Rico Water Resources Authority.

In 1957, Rafael García Palmieri was awarded another scholarship by the University of Puerto Rico to pursue a doctoral degree in clinical psychology (PhD) with a minor in neuropsychiatry at Louisiana State University. He was the only *latino* among a total of 110 students in the program. Only seven of these students completed the doctoral degree and graduated in 1959 and Doctor García Palmieri was the second highest average. While attending the PhD program, he made a 14-month special training in child psychology at the Child Guidance Clinic of the University of Louisiana. Upon obtaining his doctoral degree, he attended a one-year internship at the Veterans Administration Psychiatric Hospital in Gulfport, Mississippi.

Doctor García Palmieri was among the first group of psychologists to return to Puerto Rico with a doctoral degree in clinical psychology. In 1960, at a time when psychology services were ascribed to psychiatric services, he was recruited as psychology director for the San Juan Center of the Veterans Administration Hospital (VAH) position which he held until his retirement in 1987. In 1969, he was responsible for establishing Psychology Services as an independent department in the VAH. During his incumbency as director of the Psychology Department, he was truly committed to the recognition of post-traumatic stress disorder (PTSD) services for veterans as well as to the creation of the Vet Center both of which were among his major contributions to the VA system.

While working as a psychologist and director of Psychology Services at the San Juan VA Medical Center, Doctor García Palmieri was affiliated

with several institutions of higher education in Puerto Rico. From 1960 to 1970, Doctor García Palmieri worked as a lecturer in psychology at the College of Social Sciences and the College of Education of the University of Puerto Rico, Río Piedras Campus. Additionally, he was adjunct professor of normal and abnormal psychology and statistics at the Río Piedras Campus of said university and adviser on research design and committee member of master's theses of graduate students (1972–1982). He was, also, an *ad honorem* assistant professor in clinical psychology at the Department of Psychiatry of the School of Medicine of the University of Puerto Rico from 1965 to 1987.

Among his most significant contributions to the development of psychology in Puerto Rico was his continuous search for many talented students whom he helped to get scholarships so they could pursue graduate studies abroad and then return to Puerto Rico as professionals willing to contribute to bettering people's health. Undoubtedly, due to his continuous endeavors and commitment to the development of psychology as a scientific field in Puerto Rico as well as the professionalization of its *praxis*, his significant contributions to the veterans services in the San Juan VA Medical Center and his support to psychology graduate students, Doctor García Palmieri is recognized and distinguished as one of the pillars of its history in Puerto Rico.

He was affiliated to numerous and prestigious professional national and international organizations, including the *Asociación de Psicología de Puerto Rico* (APPR, Puerto Rico Psychology Association), formerly *Asociación de Psicólogos de Puerto Rico* (*Puerto Rico Psychologists Association*), of which he was president from 1962 to 1963. During his professional life he was an active member of the International Council of Psychologists and its Chairperson in 1985; founder and first president of *Asociación de Psicólogos Profesionales de Puerto Rico* (*Puerto Rican Professional Psychologists Association, 1977–1978*); American Psychological Association; American Congress of Rehabilitation Medicine; South Eastern Psychological Association; and Association of VA Psychologists.

Dr. Rafael García Palmieri was active presenting papers in many professional organizations. These meetings were in Puerto Rico, USA, and México. His presentations included themes like projective techniques, post-traumatic stress disorders, anxiety, Puerto Rican psychology, and motivation and verbal communication. He also collaborated in research projects at the Department of Psychiatry of the School of Medicine of UPR and at the Department of Education, all related to mental health issues in adults and children.

During his professional career Dr. García Palmieri received many honors and distinctions. In 1985, he received an Annual Certificate of Recognition for Leadership and Outstanding Achievement given by National Association of VA Psychologists (NOVA) at the 93rd Convention of the American Psychological Association. That same year, he also received a *Carta de Reconocimiento* (Letter of Recognition) from Rafael Hernández Colón, Governor of Puerto Rico. In 1984, he was bestowed an Outstanding Performance Award and a 25 Year Service Award by the Veterans Administration Medical Center and Regional Office, San Juan, PR. In 1979, Veterans Administration Medical Center and Regional Office also gave him a 20 Year Service Award, Veterans Administration, San Juan Center. He was included in the 15th Edition (1976–1977) of *Who's Who in the South and Southwest*, the Marquis Who's Who Publication Board. He also received certificates of recognition by *Asociación de Psicólogos de Puerto Rico (Puerto Rican Association of Psychologists, 1972)* and Veterans Administration (1971).

He was married to Joaquina Cerra Rocafort, who passed away in 2018. They procreated two children: Marta Margarita, a dentist, and Rafael Alfredo, Jr., an architect, living in Puerto Rico and Texas, respectively.

The professor and psychoanalyst Célio Garcia graduated in Classical Letters from the Catholic Faculty of Philosophy of Ceará in 1953. He subsequently obtained the *Licence ès Lettres – Mention Psychologie* (Emphasis on Psychology) from the *Université de Paris (Panthéon-Sorbonne)* in

1957, the *Diplôme d'Études – Psychologie Sociale* and the *Diplôme d'Études – Psychologie Pathologique* from the *Institut de Psychologie, Université de Paris*, in 1959, and the degree of Doctor of Psychology from the Faculty of Philosophy of the Universidade Federal de Minas Gerais (Federal University of Minas Gerais – UFMG), in 1965. During his stay in France, between 1953 and 1959, he enjoyed close relations with the founders of the *Association pour la Recherche et l'Intervention Psychosociologiques* (ARIP) (Research Association for Psychosocial Interventions). At this time, he participated in the widespread movement that sought the development of psychology, social psychology, and psychoanalysis in France, and the professionalization in these areas through the offering of services in the clinical, education, and work fields.

Still in France, Garcia became acquainted with the work of Jacques Lacan (1901–1981), attending the psychoanalyst's seminars in the *Hôpital Saint'Anne*, in Paris. As a student, he was part of the directing team of the GEPUP (*Groupe d'Études de Psychologie de l'Université de Paris*) (University of Paris Study Group on Psychology) and collaborated in the publication of the Lacanian seminars in the *Bulletin de Psychologie*, a periodical published by the organization. Interest in the work of Jacques Lacan was related to the psychosocial reading in psychoanalysis. For Garcia, this clinical approach meant that, for the research in social psychology and psychoanalysis, it was necessary to focus on the singular and historical experience of the group, and of the subjects inside the group. In a manuscript of 2001, Garcia referred to Lacan's approach as an exercise in research into the relationships between the unconscious, language, and the relationships of alterity, singling out freedom of thought and the linguistic and theoretical innovations introduced by the author in the debate between phenomenology, existentialism, and structuralism that occupied the intellectual milieu in France, in the 1950s and 1960s (Garcia, 2001).

Returning to Brazil, in 1960, Célio Garcia undertook research into education for health at the Ministry of Health's National Department of Endemic Rural Diseases, in Rio de Janeiro. Also

in Rio, in 1960, he married the social assistant Angelina Leite Ribeiro (1933–2021). In 1962, at the invitation of the psychologist Pierre Weil (1924–2008), he transferred to Belo Horizonte to operate as a specialist in group dynamics and development in human relationships in the pioneering service then established at the *Banco da Lavoura's* Orientation and Training Department. At this time, he and his colleagues developed psychosocial methods of work with small groups based on North American contributions in social psychology, as well as European, inspired by the socioanalysis of Jean Stoetzel (1910–1987) and of other French psychosociologists, as a contribution to the work of psychosocial intervention in commercial and industrial institutions and social organizations (Garcia, 1967).

In 1964, he was invited to set up the discipline of social psychology in the psychology program, started in 1962, at the Faculty of Philosophy of the University of Minas Gerais (currently the Federal University of Minas Gerais). In this position, he got together a group of professors and students who, under his leadership, constituted the Social Psychology Sector, focused on activities in the area with a clinical, socioanalytic tendency, deeply committed to the social and political relevance of their activities in psychosociology. The Social Psychology Sector then started to undertake works of formation in group dynamics, in psychosociological intervention, and in institutional analysis in groups, organizations, and social institutions.

Between 1967 and 1975, he organized a program of academic and scientific cooperation financed by the cultural service of the French Embassy in Brazil. Under this program, Professors Max Pagès (1926–2018), André Lévy (1925–. . .), Georges Lapassade (1924–2008), Pierre Fédida (1934–2002), from the university of Paris, and Michel Foucault (1926–1984), from the *Collège de France*, visited the UFMG on cultural missions, the first four specialists in social psychology, the last two working at the interface of Psychology and Philosophy. The 1972 visit of Georges Lapassade and his proposal of the institutional analysis approach to the study and intervention on social groups in

organizations and communities are documented in a publication of the *Revista de Cultura Vozes* in 2008, a coauthorship by Celio Garcia, Marco Aurélio Luz, Chaim Katz, and Georges Lapassade.

Garcia's first publications dealt with the social psychological interventions in small groups and mathematical models for the human sciences (Garcia, 1967). In his doctoral dissertation, defended at the Universidade Federal de Minas Gerais in 1965, he presented a research on the relationships between group processes and institutional politics. The focus was on the question of thinking to what degree work with groups inserted in institutions should be analyzed not only at the level of interpersonal, but also at the level of sociopolitical and institutional relationships.

In the beginning of the 1970s, the dialogue with René Lourau and Georges Lapassade's institutional analysis is already present, combined with the psychoanalytical approach. At this time, Garcia advanced his studies on psychoanalysis, especially in the reading of Jacques Lacan and the sciences of language, continuing with reflections on the socio-ideological dimension of the subject. Between 1975 and 1977, he undertook internships as Visiting Scholar at Harvard University and the University of California at Berkeley, in the United States of America, with a scholarship from the Fulbright Foundation, at the invitation of the social psychologist Herbert Kelman (1927-. . .) and of the linguist and specialist in the sciences of cognition Georges Lakoff (1941-. . .). During his stay in Boston, he attended the seminars of the linguist Noam Chomsky (1928-. . .) at the Massachusetts Institute of Technology (MIT), whose theory of generative grammar had interested him since his student days (Garcia, 2001). At this time, he was interested in the relationships between language, speech, and the social, as expressed in publications in *Kriterion*, the periodical of the School of Philosophy and Human Sciences at UFMG (Garcia et al., 1978).

In the 1980s, he wrote on basic concepts of psychoanalysis in the periodical *Cadernos de Psicologia*, edited by the Psychology Department

of the UFMG (Garcia, 1985, 1987). At this time, he took up again the theoretical modeling in the human sciences, working on a new scientific paradigm together with an interdisciplinary group of scholars interested in the proposal of Humberto Maturana (1928–2021), Henri Atlan (1931-. . .), and Ilya Prigogine (1917–2003). The project was to deal with scientific research in human sciences, in the sciences of life, and in the exact sciences starting from the theory of autonomous systems, of autopoiesis, and of complexity, emphasizing the creative nature of active structures, and the power of the event, of chance, and of the historical. The discovery of the impact of these historical events on the subject, for him, would be the true purpose of the clinical psychoanalysis of Lacanian inspiration. He also became acquainted with the contribution of Alain Badiou (1937-. . .) to the contemporary developments of Lacan's proposal, which resulted in another series of works.

From the 1990s onward, he advanced the study of the relations between psychoanalysis, politics, and logic and consolidated the investigations into his proposal of practice in mental health, called by him the "clinical treatment of the social." This perspective of clinical work, studying closely the subjectivity of each one within the social context, was thought of as a device-program that, mapping the different competencies of the subjects as citizens, creates always renewed instruments for thinking and making others think about the real, focusing on the creativity and innovation of each participant. In this program, subjects are considered in their singularity, their capacity for creating new social ties. The proposal developed into a similar project in the ambit of psychoanalysis and education that resulted in an important work, published in 1998, that became a reference in this area.

Célio Garcia's works, cited here, inspired various Master's theses and Doctoral dissertations, oriented by him in the postgraduate programs in linguistics, political science, philosophy, and psychology, all in the Universidade Federal de Minas Gerais. Throughout his life, the author dedicated himself intensely to clinical work in psychoanalysis. During the 1960s, he was a member of the

Psychoanalytical Society of Paris; in the 1970s, he was a member of the Psychoanalytical Circle of Minas Gerais; and from 1995 onward, he was a member of the Brazilian School of Psychoanalysis (Escola Brasileira de Psicanálise) and of the Institute of Psychoanalysis and Mental Health of Minas Gerais, in the founding of which he participated. Both institutions, which follow the Lacanian line, are connected to the World Psychoanalysis Association that was founded in Buenos Aires in 1993.

Throughout his career, Garcia was the analyst and supervisor of numerous psychoanalysts and dedicated himself to the activities of applying the knowledge of psychoanalysis in various fields, such as law, medicine, and education. Since the 1970s, he worked as institutional supervisor in public psychiatric hospitals, such as the Galba Veloso Hospital and the Raul Soares Institute, and gave strong support to psychiatric reform, supervising the activities of various Psychosocial Attention Centres and Reference Centres in Mental Health in Belo Horizonte, Brazil.

After his retirement as a professor, he dedicated himself full-time to psychoanalytical clinical work and to the guidance of psychoanalysts under training in his own consultancy, promoting seminars and the discussion of the latest trends in psychoanalysis and its relationships to juridical psychology, psychiatry, and law. On 22 August 2011, Garcia was awarded the title of Professor Emeritus of the Faculty of Philosophy and Human Sciences at the Universidade Federal de Minas Gerais for his original and consistent activities as a professor, researcher, and in the training of professionals in the promotion of mental health.

The originality, capacity for theoretical and technical innovation, and the contemporaneity of Célio Garcia's proposals continue to inspire teachers and researchers in the areas of psychology, social psychology, and psychoanalysis. After his death, a book was published in June 2021 in his honor, with the participation of several colleagues and students (Campos, 2021). A website dedicated to his works can be accessed in <https://celiogarciaoficial.com.br/>

Argentina · Spain · Literature · Psychoanalysis institutions

Although he had, what he called, an extra-university education, it took him a lifetime. He studied linguistics with Salvador Buca, logic and deductive models with Gregorio Klimovsky, and

linguistics and then psychoanalysis with Oscar Masotta.

Once in Spain, he linked up with analysts from the Freudian Field and professors from the Vincennes Psychoanalysis Department, in Paris.

He taught courses and conferences at prestigious universities in different countries: such as the Universities of Barcelona, Buenos Aires (postgraduate courses), Córdoba and also New York, Boston and Princeton. He was a member of the Sociedad Argentina de Escritores (Argentine Society of Writers).

Among another awards and distinctions, in 2003, he was awarded the Guggenheim research grant which allow him to write the book *El psicoanálisis y los debates culturales, ejemplos argentinos* (Psychoanalysis and cultural debates, Argentine examples) (García, 2005). In 2007, he was honored as “Personalidad destacada de la cultura” (“Outstanding Personality of Culture”), by the Legislature of the City of Buenos Aires. In 2008, he was named “Visitante Distinguido” (“Distinguished Visitor”) by the City Hall of San Salvador de Jujuy. The distinction was awarded by the Municipality of Jujuy at the Jujuy campus of the Catholic University of Santiago del Estero.

In 2009, he was declared a distinguished citizen and distinguished visitor of the Historic City of San Miguel de Tucumán by the Honorable Deliberative Council in the Main Auditorium of the Law School at the Universidad Nacional de Tucumán (National University of Tucuman).

In 2011, he was nominated Doctor Honoris Causa by the Universidad Nacional de Córdoba (National University of Córdoba) and in 2018 by the Universidad Nacional de General San Martín (National University of General San Martín).

He broke into the cultural scene with the appearance of his novel, *Nanina*, which was a dazzling but ephemeral publishing success (García, 1968). Between August and October of 1968, four editions of that novel were sold, approximately 20,000 copies, which found their limit by the intervention of justice with a trial for “obscenity.” At that time in Argentina, under the dictatorship of General Onganía (1914–1995), influences of the “French May” were received.

Shortly after, in 1969, García began studying psychoanalysis with Oscar Masotta (1930–1979), whose encounter García attributed his passage to this discipline. Evoking the psychopathology of Freud's daily life, García also referred the birth of a son and the death of his father as two crucial times in his personal analysis that may have contributed to his decision to study psychoanalysis as well. Then, it would reach psychoanalysis by what could be called the epistemic pathway, which finds its place in its practice.

He participated in various literature and psychoanalytic journals, founded several of them and advised others. It began in the writing of the journal *Los Libros*, directed by Héctor Schmucler (1931–2018).

When he decided to cease his collaboration in such journal, together with Luis Guzmán (born 1944), they created the *Literal* journal (1973), between literary criticism and psychoanalysis. He participated in the direction of the journal *Cuadernos Sigmund Freud* (Sigmund Freud Journal). When he settled in Spain he founded and directed another journals: *Sinthoma*, *Otium diagonal* and *Tyché*. He also advised the edition of the journal *Lacaniana* (Lacanian) which was published by the *Lacanian Orientation School* (Lacanian Approach School).

He was a member of the Advisory Board of the *Revista Universitaria de Psicoanálisis* (*University Journal of Psychoanalysis*) of the Facultad de Psicología de la Universidad de Buenos Aires (Faculty of Psychology of the University of Buenos Aires). He founded and directed the journal *Descartes* from 1986 until his death.

In the field of psychoanalysis, he promoted and founded several psychoanalytic institutions.

In 1974, he took part with Oscar Masotta in the foundation of the Escuela Freudiana de Buenos Aires (Freudian School of Buenos Aires), the first Lacanian-oriented psychoanalysis institution outside of Paris. This made possible for psychologists, for the first time, to take part in an institution whose members presented themselves as practitioners of psychoanalysis, although since 1967 by Law 17132 psychologists were forbidden to perform this professional practice. Together with Masotta, they were the only members who did

not have any university degree, being part of what Freud called, in “The question of lay analysis,” lay psychoanalysts.

With Masotta in exile, he continued with the study groups and wrote an essay that we could place as a hinge between his two activities, psychoanalysis and literature, which was published in 1975, *Macedonio Fernández: la escritura en objeto* (Macedonio Fernández: writing as an object) (García, 1975).

The coup d'état of the year 1976 found him giving his psychoanalysis classes and conducting research on the origins of psychoanalysis in Argentina, published in 1978, *La entrada del psicoanálisis en la Argentina* (The entry of psychoanalysis in Argentina) (García, 1978). This was the first book about the history of that discipline in the country, where he highlighted the background of the emergence of psychoanalysis prior to the foundation of the official institution Asociación Psicoanalítica Argentina (Argentine Psychoanalytic Association-APA). In June 1979, he joined Masotta in the “renewal of the pact” of the *Freudian School*, which was renamed Escuela Freudiana de la Argentina (Argentine Freudian School).

The political conditions would lead him to Spanish exile in 1979 where he continued spreading the thought of his friend and teacher, Oscar Masotta (1930–1979), who died in September of that year.

In July 1980, Lacan's only visit to Latin America took place on the occasion of a meeting in Caracas. Although García did not attend, he joined in by sending a letter.

In Spain, he published some of his psychoanalytic essays, among them *Psicoanálisis una política del síntoma* (*Psychoanalysis a symptom policy*) (García, 1980). He promoted the Biblioteca Freudiana de Barcelona (Freudian Library of Barcelona). He stated that in that country he found Jacques-Alain Miller's renewed teaching of Lacan's work. He decided to resume the personal analysis and continued studying with members of the *Campo Freudiano* (Freudian Field).

García's return to Argentina came shortly after democracy, in 1985. The city of Buenos Aires

that, he found, would no longer be the same he knew when he was a teenager, and he made his point in new writings (García, 2018). Psychoanalysis had to be located in the international context. This led to the foundation of the *Biblioteca Internacional de Psicoanálisis* (International Library of Psychoanalysis) in 1986, linked to the Freudian Field, and promoted the transmission of psychoanalysis throughout the country, in particular the Argentine northwest, Tucumán, Salta, and Jujuy where it encouraged the creation of groups as the *Asociación Psicoanalítica del Norte* (Northern Psychoanalytic Association). Together with the *Library*, he was one of the founders, in January 1992, of the *Escuela de Orientación Lacaniana* (Lacanian Approach School). He was president of that school and member of the World Association of Psychoanalysis. He founded and served as president and director of Education at the *Fundación Descartes* (Descartes Foundation) which managed *Descartes Center* (Centro Descartes).

Rosa Falcone

Universidad de Buenos Aires, Buenos Aires, Argentina

Keywords

Argentina · Psychology · Sociology · History · Law

He attended high school at the Colegio Nacional (National High School) at Buenos Aires, Argentina. In 1882 he earned his Law degree with a Dissertation on *Los hechos y los actos jurídicos* (*Facts and Legal Facts*). While he was teaching at the National High School, he started to produce pedagogical and theoretical works, the first of which was published under the title of *Nociones de geografía argentina* (Notions of Argentine Geography) (García, 1883), a book oriented to high school education (Proyecto Ameghino, 2004).

In 1884 he traveled to Europe, visiting Paris and other important cities for almost two years. Upon his return to Argentina, he took up the position of Inspector of National High Schools and Teacher Training Normal Schools. In 1892 he was appointed Crime Attorney. In his judiciary career, he was appointed Criminal Investigating Judge in 1893, and later Civil Judge and member of the Federal Court of Appeal, from 1902 up to 1913 (Mignanego, 1937; Proyecto Ameghino, 2004).

As professor he was in charge of many courses at the Facultad de Derecho y Ciencias Sociales de la Universidad de Buenos Aires (Faculty of Law

and Social Sciences at University of Buenos Aires, among them: Introduction to Legal Sciences, Sociology, Civil Law and on the ideas of Juan Bautista Alberdi (1810–1884)). He was also Professor at the Universidad Nacional de La Plata and at the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities at University of Buenos Aires). He also founded and directed the journal *Anales de la Facultad de Derecho y Ciencias Sociales* (Annals of the Faculty of Law and Social Sciences). Some of Juan Agustín García's books were widely distributed. For instance, *Historia de la Universidad de Buenos Aires y su influencia en la cultura argentina* (History of the University of Buenos Aires and its influence on Argentine culture) (García, 1918). Two other books transcended the university context and were indispensable for understanding nineteenth century Argentine society.: One of them, *Introducción al estudio de las ciencias sociales argentinas* [Introduction to the Study of Argentine Social Sciences] (1899), is a comprehensive compilation of the legal forms throughout history and their reflection in the construction of society, with special focus to the social, political, and institutional processes that made up the Argentine Nation. He highlighted the existence of Argentine social phenomena susceptible to scientific interpretation and stated that our institutions, despite their foreign labels, were formed on the basis of our own political and economic background. The other one, *La ciudad indiana* (The Indian City) (1900), is an investigation into the political and institutional origins of Argentina, in which racial factors explain some of the most questionable traits of the inhabitants of *the pampas*: the cult of courage, confidence in the rich land, profit, intellectual indolence (Vilanova, 2001).

Diego Pro (1965) places Juan A. García in the generation of 1896, together with Ernesto Quesada (1858–1954), José Ingenieros (1877–1925), Joaquín V. Gonzalez (1863–1923), Carlos Octavio Bunge (1875–1918), Víctor Mercante (1870–1934), Rodolfo Senet (1872–1938), among others. It is possible to affirm that the ideas and works of these men constitute classics of Argentine culture.

Regarding his contributions to psychology, Diego Pro (1965) stated that Juan Agustín García was a man of nuances. His psychological ideas were close to the psychological positivism of Taine (1828–1893), Renán (1823–1892), Ribot (1839–1916), Bain (1818–1903), Sergi (1841–1936), and Wundt (1832–1920). In his historical studies, he has been attracted to the natural course of life rather than to military, political, or economic history. He penetrated into the soul of the people, scrutinizing their dominant feelings. Pro (1965) characterized García as follows: "Rather than the history of ideas, García was concerned with the historical study of the feelings of the Argentine people." Hence, his interest in the study of psychology or mental science, which he defined "as the study of all the so-called psychological phenomena, the impressions caused by the external world, the facts of the intelligence, desires, pleasures and pains in their different forms and manifestations" (Pro, 1965, p. 51).

For his part, Alberto Vilanova (2001) emphasized the interest in social psychology and the study of mentalities in the writings of Juan Agustín García. Two authors influenced his scientific delimitation of psychology: Hyppolyte Taine with his book *L'Intelligence* and Alexander Bain with *The Senses and the Intellect*. Psychic phenomena were studied at their onset, in their development, in their combinations and in their final results. He studied the elementary manifestations of human activity, instinct, automatisms, habits, and the will (Pro, 1965).

García subdivided psychology into three branches: (1) historical psychology, (2) special or character psychology, and (3) social psychology. He argued that in both the social and historical sciences, psychology helped to understand the dominant feelings of the people. Concerned about the Argentine ideas, he considered that knowing the feelings helped the self-awareness of the people, without which they would wander around history blindsided (García, 1899). He illustrated his ideas by stating that the study of Argentine psychology should start with the study of the colonial society, its ways of feeling and thinking, the psychological peculiarities of the different ethnic, economic and social groups,

which lived under special physical and moral influences, while pointing out the importance of racial and hereditary factors (Levene, 1945).

It is possible to classify his written production into two main groups: scientific writing, on the one hand, and literary writing on the other one. The first group includes not only works related to social psychology but also related to legal sciences, history or sociology. Among his literary writings, there are: a) historical novels: *Memorias de un sacristán* (Memoirs of a sacristan) (1906) and *La Chepa Leona* (1910); b) theatre plays: *Del uno al otro* (From One to the Other) (1920), *El mundo de los snobs* (The World of Snobs) (1920), *La Cuarterona* (In her forties) (1921), *Un episodio bajo el terror* (An Episode Under the Terror) (1923). He also authored a number of minor writings, letters, reports, class summaries, and another page, which could be classified under the category of *Miscellany*. They constitute a series of articles published in the newspaper *La Prensa (Press)*, as articles on customs, just like those that Alberdi signed under the name of Figarillo (Solari, 1954).

García-Sellers, Martha Julia

Born *Guatemala City, Guatemala, 20 May 1943*

Guisela Cárcamo Duarte
Independent Psychologist, Guatemala City,
Guatemala

Keywords

Guatemala · Developmental psychology · Immigration · Education · Home-school connection

Dr. Martha Julia Garcia-Sellers was born into a family that highly regarded education and the social sciences; consequently, she initially studied preschool education. As she began to practice the profession as a kindergarten teacher, she soon realized how important it was to understand how

children learn a recognition that inspired her to study psychology. She is married to Stephen Sellers, and is the mother of Oliver and Sylvia, both of whom also have careers in the social sciences and is the grandmother of Rowan.

Dr. García-Sellers enrolled as student at the Psychology Program in Humanities at San Carlos University in Guatemala. During her second year of university studies, she was hired as research assistant in the Psychology Division of the Institute of Nutrition of Central America and Panama (INCAP), subsequently becoming director of the Infant Laboratory. At INCAP her supervisors, the psychologists Robert Klein and Otto Gilbert Almengor, encouraged her to conduct the research for her academic thesis as part of an ongoing project applying a battery of psychological tests to measure reflexivity and impulsivity of 3- to 7-year-old children (García, 1969). This became a formative experience introducing her to the world of research and psychometrics.

She received her degree in 1969 becoming the university's first psychology graduate to be awarded the distinction of *Magna Cum Laude*. That honor and the research that underlay it opened doors for her to pursue graduate studies at Harvard University in the USA. Enrolled in the doctoral program of developmental psychology, she carried out her dissertation research on the development of memory strategies among elementary school children in Tucurrique, a rural community of Costa Rican (Sellers, 1979). That research contributed importantly to the understanding of memory development and its specificity by demonstrating that some memory strategies need to be taught while others, if encouraged, can emerge spontaneously. The research work was particularly gratifying for her, taking into consideration that findings from Latin America contributed to, and informed, the area of memory development science in the USA, as opposed to the other way around.

After receiving her doctoral degree, she was appointed to a position at the Psychiatry Department of Washington University in St. Louis, Missouri, in 1981, where she taught normal child development as a starting point for understanding

psychopathology. Collaborating with psychiatrist Felton Earls, she trained public school teachers in classrooms that had recently incorporated minority students as part of a government program to further school integration. Soon after, she created the first Interdisciplinary Unit for the Evaluation and Intervention of Infants and Preschoolers, promoting an integrated, multidisciplinary method that was subsequently adopted by programs elsewhere in the USA.

Family considerations then took her to California where she worked in the Psychiatry Department at Stanford University in 1985, teaching child development to students in pediatrics and psychiatry. A few years later she returned to Boston, where she continued to live until her retirement.

In Boston she joined Harvard University's Psychiatry Department in 1988 as a clinician in a multidisciplinary team. A year later, she moved to Tufts University where she served on the faculty in the Child Development Department for the next 24 years, teaching child assessment, services for children from diverse ethnic backgrounds, and research methods. Throughout, her teaching clinical work and research focused on serving families from diverse cultures. Boston was experiencing a significant upsurge in Central American immigration at this time and the public schools, especially, were struggling to provide for them. Dr. García-Sellers created and directed the Somerville Home-School Connection Program for children in kindergarten through fourth grade in the local public schools. With funding provided by the Kellogg Foundation and the Commonwealth of Massachusetts, her program identified immigrant families then supported children's school participation and facilitated the process of school adaptation. Under Dr. García-Sellers' supervision, students from Tufts graduate program provided guidance to families in visits to their homes and to children and their teachers at school. Later, in 2007, the program was implemented in conjunction with the Gesell Institute of Yale University at Head Start schools in New Haven, Connecticut, and also at the "Cambiando vidas" ("Changing Lives") schools in Pastores, Sacatepéquez, Guatemala.

Subsequently, in 2009 under sponsorship of the Cultural Change Institute at the Fletcher School of Tufts University, Dr. García-Sellers conducted a three-year research project with 2-year-olds whose families had immigrated to East Boston, Massachusetts, from Mexico and Central America. The study's objective was to prepare children for school adaptation from a young age with their mothers, providing support and intervention at home. The intervention comprised a set of activities oriented toward developing executive functions and intellectual autonomy (García-Sellers, 2016).

Dr. García-Sellers has published articles on infant development and how it is related to environmental stimulation in the home, the formation and role of the teacher, the role of the family, and the psychologist's role in education. She has coauthored books on the importance of the relationship of expectations of home and school so that children's school adaptation and performance improves (Brizuela & Garcia-Sellers, 1999; Garcia-Sellers, 2016; Parra & Garcia-Sellers, 2005; Shapiro & Garcia-Sellers, 2003).

She has been an invited speaker to international conferences in many countries including Brazil, Mexico, Guatemala, the USA, Kuwait, Hungary, Hong Kong, Sweden, Finland, and Canada. And she has served on the boards of a number of organizations including JOBS Child and Family Study at Child Trends, Washington, D.C.; National Center on Fathers and Families, Graduate School of Education, and University of Pennsylvania, Philadelphia; Edgerly Educational Center Child Study Team, Somerville, Massachusetts; Parent-Teacher Connection Program, Gesell Institute, New Haven, Connecticut; Child Rearing Study in Costa Rica; Tufts University Cultural Change Institute, Fletcher School, and Harvard University Collaboration; and "Cambiando Vidas" ("Changing Lives") in Pastores, Sacatepéquez, Guatemala.

In the course of her professional career, she had the opportunity to collaborate with renowned scientists from several disciplines. With Professor Jerome Kagan, one of the preeminent psychologists of his generation in the USA, who was her mentor at Harvard University, she collaborated on

several research projects beginning with their work together at the Institute of Nutrition of Central America and Panama (INCAP) and continuing with projects related to intervention and teacher training. With Dr. T. Berry Brazelton, considered one of the best-known pediatricians in the USA, she learned much about assessing newborns, understanding the child from the youngest age possible to provide opportune parental guidance. She benefited also from training with the Harvard anthropologists Beatrice and John Whiting who were among the first to carry out multicultural, comparative research on child rearing practices and to develop qualitative research methods. Absorbing the knowledge of these experts in their respective fields enabled her to combine quantitative and qualitative methods into her own clinical work, research, and teaching with a cultural perspective (García-Sellers, 2016; Rogoff et al., 1976).

Since 2003 Dr. Garcia-Sellers has contributed her efforts and expertise *ad honorem* to supporting the services of the Psychology Unit in the Nutritional Project of the Hermano Pedro Hospital in La Antigua Guatemala, Sacatepéquez, Guatemala, and to strengthening the services to families with severely malnourished children. Her efforts have enabled graduate students in psychology, psychiatry, and public health from Tufts and other universities in the USA and Canada to participate in different projects in Guatemala. Together with some of these students she developed a manual used to train volunteers called *Little by Little* which presents procedures for exploratory evaluation and intervention (Mayoral et al., 2007). Her work in this area continues to date.

In 2010 Dr. García-Sellers was awarded the distinction of Illustrious Professional by the Assembly of Presidents of the Board of Professionals of Guatemala.

- The son of Ángel Manuel de la Garma y Setién, a businessman, and of Cirila Zubizarreta, he was born in Bilbao, Spain, on June 24th, 1904. His parents emigrated to Buenos Aires in 1908 and he remained under the care of his maternal grandparents in Spain. Due to the death of his father, he continued living with them until he was nine-years-old. Remarried, his mother returned for him and they moved to Madrid. He later studied in a Jesuit College and then entered the Universidad Central de Medicina (Central University of Medicine), currently Universidad Complutense (Complutense University). He had outstanding professors such as Gregorio Marañón (1987–1960) and Santiago Ramón y Cajal (1852–1934). He obtained his degree as a physician in 1927. During this period he lived in the Student's Residence. José Ortega y Gasset (1883–1955) was one of the directors of the Residency along with other important personalities of Spanish culture in the twentieth century. The

students of the residency were carefully selected and included figures like the filmmaker Luis Buñuel (1900–1983), the poet Federico García Lorca (1898–1936), the painter Salvador Dalí (1904–1989), and the writer Juan Ramón Jiménez (1881–1958) (Anonymous, 2020; Markez, 2005).

When he finished his studies, he traveled to Germany to specialize in neurology and psychiatry. He obtained a specialization in psychiatry in 1929 at Tubinga University in Germany, which was an epicenter for research of psychoanalysis, which received great relevance at those times.

He participated at the Berlin Psychoanalytic Institute, where he met Franz Alexander (1891–1964), Wilhem Reich (1897–1957), Siegfried Bernfeld (1892–1953), René Spitz (1887–1974), Carl Gustav Jung (1875–1961), and Georg Groddeck (1866–1934) among others. In Berlin, he was analyzed by Theodor Reik (1888–1969), supervised by Otto Fenichel (1897–1946) and Karen Horney (1885–1952) (Garma, 1966).

He became a psychoanalyst in 1931 and was elected as a member of the German Psychoanalytic Association. When the institution expelled its Jewish members in 1936, he resigned his membership (Carmen Garma, Angel Garma's daughter, personal communication, May 1, 2021). On his return to Madrid in November 1931, he was the only psychoanalyst member of the IPA, International Psychoanalytical Association, working in Spain. As he gained prestige, he was challenged by colleagues who espoused the positivism perspective in psychiatry. In October of 1932, Sigmund Freud sent him a letter of congratulations for his valuable psychoanalytic works (Garma, 2020).

He set off to Paris a few days before the Spanish Civil War broke out, in 1936, and stayed there for two years, in an unstable Europe, with the imminent arrival of the Second World War. In France, he met Celes Cárcamo (1903–1990), with whom he discussed the possibility of emigration to Argentina. In 1939, he travelled to Buenos Aires (Garma, 1967). Part of his family had some business with Argentina, providing him some income. He traveled alone initially but was later joined by his first wife (Carmen Garma,

Angel Gama's daughter, personal communication, April 26, 2021). That year he started meeting at the Boston Café on Sunday afternoons with a small group of people interested in reading about psychoanalysis, and in the foundation of a psychoanalytic Institution with an international connection (Bloj, 2015; Rascovsky, 1994).

In 1942, along with Enrique Pichón Rivière (1907–1977), Marie Langer (1910–1987), Celes Cárcamo (1903–1990), Guillermo Ferrari-Hardoy (1914–1977), and Arnaldo Rascovsky (1907–1995), he signed the foundation of the Asociación Psicoanalítica Argentina (Argentine Psychoanalytic Association) (APA) (Zalbidea et al., 1991). This association managed, formulated, and regulated the application of psychoanalysis in Argentina until the late 1960s, and was the first of its kind in Latin America. Ángel Garma was its president during the years 1943, 1949, 1953, 1957, and 1958 (Bloj, 2015; Garma, 2020). He developed and sustained letter exchanges and personal meetings with the main international referents, keeping epistolary interchange and meetings with relevant personalities in psychoanalysis including: Daniel Lagache (1903–1972), Sandor Lorand (1893–1987), Bryce Boyer (1916–2000), Paula Heimann (1889–1982), Barbara Lantos (1896–1962), Bertram Lewin (1896–1971), Clifford Scott (1903–1997), Leo Rangell (1913–2011), Ernest Jones (1879–1958) and Theodor Reik (1888–1969) among others (Barrera & Ferragutti, 2015). He took part in the foundation of the *Revista de Psicoanálisis* (Journal of Psychoanalysis) in 1943.

After the Second World War, in 1949, he attended the 1st Congress of Psychoanalysis in Zurich together with his wife Betty Garma (1918–2003) and other members of the APA, where they debated with Anna Freud (1895–1982), Melanie Klein (1882–1960), and others. In the mid-1950s, psychoanalysis was included in university studies. Garma and other APA members dictated extension courses in several universities in Argentina: Universidad Nacional de la Plata (University of La Plata), Universidad de Buenos Aires (University of Buenos Aires), and a brief participation at the University of Córdoba and Rosario. He also

taught courses as a guest professor in Brazil, and the United States, at the Menninger School of Psychiatry in 1962.

Among many acknowledgments, he received the Platinum Konex Prize in 1986 for his career as a psychoanalyst in Argentina and later, with the Gran Cruz del Orden del Mérito Civil given by the King of Spain in 1989. He was also appointed Member of Honor of the Spanish, Mexican, and Colombian Psychoanalytic Association (Garma, 2020).

The interest in dreams was present throughout his years of practice. *Psicoanálisis de los sueños* (Psychoanalysis of the dreams) was the title of the dissertation with which he revalidated his physician's degree at the University of La Plata. He reworked a hypothesis previously discussed with Otto Fenichel, in which he stated that dreams, more than the satisfaction of desires, are masked traumatic situations. He developed the importance of the interpretation of dreams as a means to analyzing the psychogenesis of neurosis and as an efficient technique in an analytical clinic (Garma, 1966). That dissertation was the genesis for his book, *Psychoanalysis of dreams* (Garma, 1940), with enlarged editions arriving in 1948, and in 1956, an abridged edition in 1963, and a 5th edition in 1974. His work acquired international importance, being translated into French in 1954 and then English in 1966. The production of Ángel Garma was truly prolific. He published a vast number of articles, books, and essays in several languages, mainly Spanish, French, and English. His themes were wide and diverse, the most significant of which were psychoanalysis and religion, psychoanalysis and psychosomatic medicine, and ornamental art. We could say that Ángel Garma lived as a psychoanalyst, making his practice, production, and spread of psychoanalysis to many countries and institutional management, a passion that has awakened the interest and the deep search of the knowledge of the unconscious dimension of the subject in several generations.

Within an APA tribute to him, Garma stated: "If I lived again I would be a psychoanalyst one more time . . . for various reasons: in the first place because psychoanalysis is a beautiful

science, it is a nice science to cultivate and results pleasurable to investigate it. In the second place I would be a psychoanalyst again because at least to me, it has given me wellbeing, it has increased my life's wellbeing. Thanks to psychoanalysis I live better than what I would have lived without psychoanalysis. In the third place I would be a psychoanalyst again because in the psychoanalytic media you also find people you can love, give and receive affection from . . ." (APA, 2002).

He attended elementary school at the school Profesora Mariana Valdés (Berrelleza 1998) and high school at Colegio Rosales (Rosales College) (1897–1902) where he was outstanding, both in his hometown (Historical Archive of the Autonomous University of Sinaloa [HAAUS], Rosales College [CR] Fund, exam report books, 1890–1899 and 1899–1907). He entered the career of doctor, surgeon, and midwife at the Facultad de Medicina y Farmacia de Guadalajara, Jalisco (Faculty of Medicine and Pharmacy of Guadalajara, Jalisco) in Mexico, from which he graduated in 1908 (Historical Archive of the University of Guadalajara, Fund for Educational Institutions of Jalisco, Sub fund for School of Medicine and Pharmacy, Series Professional Titles, Book 11, File 900, fs. 212–215). At this stage, he taught psychology at Escuela Normal de Guadalajara (the Normal School of Guadalajara, a teacher training school), an experience that influenced in your interest in this discipline (Genaro Estrada Diplomatic Historical Archive of the Ministry of Foreign Affairs, File of Bernardo J. Gastélum, [2-20-47]). In the 1910s, he earned a specialty in gynecology from Columbia University, New York (Beltrán 2017).

After completing his medical studies, he returned to Culiacán and began to carry out various activities: he set up his medical office and served as deputy director and director of the Casa de Beneficencia (House of Charity), director of Cárceles (prisons), forensic doctor, and professor of psychology, sociology, and logic at Colegio Rosales. From 1910 to 1912, he entered positions of popular election as councilman of the Culiacán City Council, and in 1911 and 1913, he was part of the State Studies Board of Directors (Municipal Historical Archive of Culiacán, Government Fund, Acts of Cabildo Series, 1909–1912; HAAUS, CR Fund, Book of appointment of professors, 1900–1918).

In December 1915, he assumed the direction of the Colegio Rosales – an institution created in 1874 during the government of Mr. Eustaquio Buelna and whose headquarters was the Liceo Rosales (High School Rosales) – and with such character began to prepare the conditions to transform it into an autonomous regional university,

which occurred in May 1918. This institution was called the Universidad de Occidente (University of the West), during which, as founding rector, he encouraged psychology to be a specific subject in the curricula since at Colegio Rosales it was associated with logic and moral (Beltrán 2018). He published *Principles of Psychology* in 1920, a book in which he systematized the state of knowledge and set a position in favor of the current in vogue: experimental psychology. In this text, in addition to defending the inclusion in the curriculum of sexual education and religious education, he analyzes some obstacles that slow down the learning and development of science, identifying encyclopedic teaching among them for not stimulating the ability to think, contributing with the latter to the field of educational psychology (Beltrán, 2017).

The Universidad de Occidente did not prosper due to the lack of financial support as a result of the struggles between the groups of the revolutionary political class, so it returned to the collegiate structure. Once this university was established by Governor-General Ramón F. Iturbe (1889–1970), he dealt with the disagreement of Ángel Flores (1883–1924), the general defeated in the elections by the Governor in 1917, who later became Governor of Sinaloa in 1920. Given this, Gastélum resigned from the rectorship in March 1922 to enter the federal public administration in the government of General Álvaro Obregón (1920–1924), with whom he had a friendship; he also participated in the presidencies of General Plutarco Elías Calles (1924–1928), Emilio Portes Gil (1928–1930), and Pascual Ortiz Rubio (1930–1932). The positions he held were undersecretary and secretary of Public Education (1923–1924), head of the Department of Public Health (1924–1928), Envoy Extraordinary and Minister Plenipotentiary in Uruguay and Paraguay (1922–1923) and in Italy and Hungary (1929–1930), and Federal Delegate of Health in Sinaloa (1932–1934) (Beltrán, *in press*).

During his stay in the Secretaría de Educación Pública (Ministry of Public Education) and in the Departamento de Salubridad Pública (Department of Public Health), he worked with writers who formed *Contemporáneos* (the Contemporary

group) who edited a magazine with the same name, of which he was a patron and participated as an essayist. He also taught gynecology and gynecological clinic at the Escuela Nacional de Medicina (National School of Medicine) and psychology at the Escuela Nacional Preparatoria (National Preparatory School) (Beltrán, *in press*).

In 1927, Espasa-Calpe published *Intelligence and Symbol*, a book made up of 13 essays whose backbone is intelligence. In this work, he is observed advancing in his epistemological position with respect to psychological discipline, since he criticizes experimental psychology when affirms that the main error of this was to try to rise up to man, when it should have focused on the study of animals (Gastélum, 1927, p. 145). Gastélum's theoretical-conceptual development is innovative because it builds bridges between psychology and philosophy, history, aesthetics, biology, and physics, with which he appears as an interdisciplinary thinker (Beltrán, *in press*).

His political career began to decline with the death of General Obregón and ended in June 1934, when the process of decline of the power of Calles and the rise of the current represented by General Lázaro Cárdenas was already evident. After a 17-year stay in Sinaloa (1930–1947), in which he combined his medical duties with those of the director of the Escuela Preparatoria de Mazatlán (Mazatlán Preparatory School) and as writer, he returned to Mexico City in 1947 (Beltrán, *in press*).

From his articles in the *Gaceta Médica de México* (Medical Gazette of Mexico), organ of the Academia Nacional de Medicina de México (ANMM) (National Academy of Medicine of Mexico), gynecological and obstetric topics stand out in which he contributed to the field of women's psychology, making clear his conception of the patient as a biopsychosocial entity in which the biological and medical part is intertwined, with psychological, social, philosophical, and historical elements. For this reason, his medical practice as a gynecologist started from the premise that he should know “feminine psychology, to distinguish if their complaints correspond to the sorrow they suffer or are products of their natural exaggeration, and determine if the

subjective symptoms are conditioned by a cause somatic or if they originate in their fantasy” (Gastélum, 1950).

In 1954, he published *Castles in the Air*, a theater play in which he problematizes and reflects on the complexity of the human psyche, presenting some concepts from the field of psychology, such as behavior, intelligence, and affective states, in connection with the old philosophical question about what is man (Gastélum, 1954; Beltrán, *in press*).

He was a member of various professional associations: Sociedad de Cirugía de Guadalajara (Guadalajara Surgery Society), Sociedad Médica Mexicana (Mexican Medical Society), American Public Health Association, Oficina Sanitaria Panamericana (Pan American Sanitary Office), Cruz Roja Española (Spanish Red Cross), Italian Chemical Society, International College of Surgeons, Latin American Association of National Academies of Medicine, Academia Nacional de Medicina de México (Academy National Medicine of Mexico), Asociación Mexicana de Cirugía (Mexican Association of Surgery), Ateneo de Ciencias y Artes (Athenaeum of Sciences and Arts), Sociedad Chihuahuense de Estudios Históricos (Chihuahuan Society for Historical Studies), Sociedad de Estudios Biológicos (Society for Biological Studies), and Sociedad Mexicana de Higiene (Mexican Hygiene Society) (Archive of Dora Gómez Palacio Gastélum, biography of Bernardo J. Gastélum prepared by Dora Gastélum Izábal). In addition, he attended various medical, educational, and other congresses, such as the Primera Conferencia Panamericana de Directores de Sanidad Pública (First Pan American Conference of Directors of Public Health) (Washington, 1926) and the Noveno Congreso Internacional de Psicología (Ninth International Congress of Psychology) (1929, Chicago) being of particular relevance (Genaro Estrada Diplomatic Historical Archive of the Ministry of Foreign Affairs, File of Bernardo J. Gastélum, [2-20-47]).

He received the following distinctions: Medalla de la Sociedad Físico Química Italiana (Medal of the Italian Chemical Society), Medalla de Primera Clase de la Cruz Roja Española (First Class Medal of the Spanish Red Cross), Miembro

Honorario del Séptimo Congreso Panamericano del Niño 1935 (Honorary Member of the Seventh Pan American Children’s Congress), Medalla de Oro y Diploma “Eduardo Liceaga” 1945 (Gold Medal and Diploma “Eduardo Liceaga”), Diploma de Honor como Maestro en Salud Pública 1959 (Diploma of Honor as a Master in Public Health), and Doctor Honoris Causa por la Universidad de Sinaloa 1965 (Doctor Honoris Causa from the University of Sinaloa) (Archive of Dora Gómez Palacio Gastélum, biography of Bernardo J. Gastélum prepared by Dora Gastélum Izábal).

In the end of his life, he was recognized with two honors: one by the Secretaría de Salubridad y Asistencia in 1978 (Ministry of Health and Assistance) and the other in 1979 by the Sociedad Mexicana de Historia y Filosofía de la Medicina (Mexican Society for the History and Philosophy of Medicine), the Academia Nacional de Medicina de México (ANMM), and the Sociedad Mexicana de Salud Pública (Mexican Society for Public Health). Likewise, his figure has been the subject of posthumous acknowledgments, such as that provided by the ANMM (1983) and that of the Ministry of Health in which his name was established on the Hospital General de Culiacán (General Hospital of Culiacán, 1990) (Beltrán, *in press*). His remains rest in Panteón Jardín de México (Pantheon Garden of Mexico) (Archive of Alfonso Gómez Palacio Gastélum. Title No. 36017 in the Pantheon Garden of Mexico).

Eva Giberti is a social worker, psychologist, and one of the main disseminators of psychoanalysis in Argentina since the 1960s. Her profuse work in mass media, magazines, books, radio, and TV appearances made her a cultural and social reference on child-rearing patterns from an expert and, at the same time, friendly and approachable perspective. She was, also, one of the first psychologists to work on gender issues in Argentina, including topics related to female eroticism, mother-child relationships, adoption, sexual abuse, and social inequality.

She graduated as a teacher and then as a social worker with orientation in Juvenile Court from the Facultad de Derecho y Ciencias Sociales, Universidad de Buenos Aires (Faculty of Law and Social Sciences, University of Buenos Aires, UBA). In addition, she continued her training through a series of WHO-funded fellowships at the Centre Internationale de l'Enfance (International Childhood Center, CIE) in Paris, Belgium, and Italy. In the mid-1960s, she graduated as a psychologist (UBA) and she received an *Honorary Doctorate* from the Universidad de Rosario (University of Rosario) and from the Universidad Autónoma de Entre Ríos (Autonomous University of Entre Ríos) in 2006 and 2010, respectively.

She began her career as a journalist and in the late 1950s began to publish a column in the

newspaper *La Razón* (*The Reason*) that explicitly stated the need to educate parents in healthy parenting guidelines for their children's psyche. The project, which was entitled "Escuela para Padres" (School for Parents, *EP*), became widespread, reaching three weekly columns in a newspaper with a circulation of 500,000 copies. Inspired by the French experience, which she knew from her training abroad, *EP* was in line with a renewed discourse on parenting with a professional approach that considered the sociocultural changes of the time: the intergenerational difference in parenting practices and a prospective vision of children as adults of the future (Borinsky, 2006). In *EP*, the role that Giberti gave to mothers as irreplaceable guardians of their children's mental health was further developed in different publications in women's magazines such as *Para Ti* (*For You*) or *Vosotras* (*You*) (Cosse, 2010).

Giberti had already published a few articles on psychoanalysis in *Nuestros Hijos* (*Our Children*) and *Esto Es* (*This is*) and, given the success of his columns, she compiled her articles in a three-volume book: *Escuela para Padres* (*School for Parents*). It had 30 editions since 1962 and at least 200,000 copies sold, including a second part of the project published in 1969 under the name *Adolescencia y educación sexual* (*Adolescence and sexual education*) (Carpintero & Vainer, 2004). Her training as a social worker and, later, as a psychologist, placed her in a different position than psychoanalysts trained in the Asociación Psicoanalítica Argentina (Argentine Psychoanalytic Association) (APA) which may have contributed to her popularity. Her vision of psychoanalysis was receptive to North American and culturalist developments, diluting the importance of infantile sexuality and the Kleinian references in her theorizations (Plotkin, 2002).

Parallel to writing her columns, she began to implement the *EP* project at the Hospital de Niños de Buenos Aires (Children's Hospital of Buenos Aires). Her work was carried out in the team led by her then partner, the renowned pediatrician Florencio Escardó (1904–1992), in Ward 17 of the Children's Hospital. In 1967, the project

became part of the Facultad de Medicina, UBA (Faculty of Medicine, UBA) (Rustoyburu, 2009).

The impact of post-war ideas about the socio-familial origin of mental illness also implied the psychologization of everyday life, as well as the intervention of professionals and the dissemination of these ideas beyond professional circles (Herman, 1995; Rose, 1990). *EP* can be seen as an example of that new framework, as it brought to the forefront the tools that psychology and psychoanalysis could provide for the prevention of mental illness. The dissemination of psychoanalysis was part of a wider process of expert regulation of parenting patterns, disseminated in the mass media in accessible language, a process in which Giberti played a superlative role. In addition to her work on the press, books, radio and TV shows, she gave lectures in a wide variety of settings (clubs, factories, and schools) and released a vinyl record that positioned her as a reference in the media (Plotkin, 2002).

EP continued until 1973, when, after multiple raids and the imprisonment of her son for political reasons, Giberti had to withdraw from the public scene. However, she continued her work as a writer and lecturer in various universities both at home and abroad, as well as in private practice. Among the topics she worked with from the 1970s onward were upright birth positions, adoption, and female eroticism which led her to incorporate these subjects into the university curriculum. Thereby, she was part of the first university course in Latin America dedicated to the study of sexual life: "Sociología de la Vida Sexual" ("Sex-Life Sociology") at the Universidad de Belgrano (University of Belgrano) (Giberti et al., 2006). At the same time, she was part of the founding nucleus of the Centro de Estudios de la Mujer (Women's Studies Center, CEM), one of the first institutions in Argentina to work on the intersections between psychological and psychoanalytic knowledge and feminism.

In 1990 she was the representative for Latin America of the Fédération des Ecoles des Parents et des Educateurs (Federation of School for Parents and Educators), based in France, and since 1993 she has been a member of the Presidential

Council of the Asamblea Permanente de Derechos Humanos (Permanent Assembly for Human Rights). In the 2000s she became an advisor to the Consejo de los Derechos del Niño, la Niña y Adolescente (Council for the Rights of Children and Adolescents) of the City of Buenos Aires, having been declared an Illustrious Citizen in 2002. Since 2006, she has been the director of “Las Víctimas contra las Violencias” (“Victims against Violence”), a program dependent of the Ministerio de Justicia y Derechos Humanos de la Nación (National Ministry of Justice and Human Rights). At this point, she brings together her interests in Psychology, Psychoanalysis and social interventions, recovering her work on the family, adoption, female eroticism, and obstetric violence (Nicora, 2018). This work, which allows her to articulate the production of knowledge with direct interventions on social issues, has also deepened her inclusion as an agent of public policies on child abuse, gender violence, and the fight against social inequality.

Otto Gilbert Almengor had his first contact with a course in psychology in his fourth year of secondary school in Guatemala in 1947. This course was taught by a law student of the university, because there were no psychologists in Guatemala at that time. He started his formal psychology courses in the College of Arts and Sciences at Louisiana State University, and in 1952, he obtained the Bachelor's degree in Psychology with a minor in Sociology. He continued his studies for his master's degree at the same university and graduated with a Master's degree in Clinical Psychology in 1953, with the equivalent to a Cum Laude. He was the first Guatemalan who obtained a postgraduate degree in psychology (Aguilar & Recinos, 1996).

He returned to Guatemala City and was incorporated as a professional psychologist with the degree of Master in Psychology in November of 1954. In Guatemala, he worked as a professor in four Universities: San Carlos de Guatemala University, Rafael Landivar University, Francisco Marroquín University, and Del Valle de Guatemala University. He taught the courses of Experimental Psychology, Descriptive and Differential Parametric Statistics, Projective Techniques, and Modern Psychological Schools. He also conducted creativity seminars.

He initiated and participated in several research projects in different institutions. From 1954 to 1961, he directed the research team who translated, adapted, and administered the Otis Intermediate and the Otis Superior general ability tests, Form "A." The Differential Aptitude Tests Battery, Form "A," created by Bennett, Seashore, and Wesman, and the Thurstone Interest Scale were also worked out by this research team. These tests were administered to Guatemalan school children of public and private schools, and statistically significant differences were found between the mean scores of public and private schools pupils. Considering these results, the research team decided that it was necessary to establish if there were also differences between different groups of school children in other growth and development areas as: height, weight, grip strength, bone maturation, and dental growth.

Therefore, Dr. Gilbert and the American School research team initiated a longitudinal study of the growth, development, and maturation

of Guatemalan primary and secondary school children. The height, weight, carpal bone maturation, dentition, and grip strength measurements were taken at a specific date for each child, every year. This longitudinal study has been continued by Del Valle de Guatemala University, up to the present.

By 1958, enough data had been collected in order to calculate mean and standard deviation for subjects from 7 to 17 years old, for male and female students, in each of the five variables, included in this research. The mean of the ages of development the child had achieved at this date, in these five variables, was considered his or her organismic age. From this date on, it was possible to consult Guatemalan children's norms of growth and development in these five areas of growth and development.

From January 1962 to March 1963, he conducted doctoral studies at Michigan State University.

In 1963, Dr. Gilbert worked as a one of the main professionals of the Institute for research and Improvement of Education, at San Carlos University. He cooperated in the collection of data required to establish the state of primary education in the five countries of Central America.

From August 1965, until February 1971, he was the head of psychologists' team that participated in another longitudinal growth and development study of Guatemalan children, from birth to 7 years of age, living in rural areas. The purpose of this study was to establish if malnutrition during the first 7 years of the child's life, affected his or her intellectual development. This study was conducted by Institute of Nutrition for Central America and Panama, with funds provided by the National Institutes of Health, in Washington, DC.

In order to establish an infant's growth rate, he developed a new Infant Scale, in Spanish, which was a modification of Gesell's Infant Scale that incorporated items of other scales, for Guatemalan children. The results of the administration of this scale were presented by Doctor Gilbert in 1967 at the XI Interamerican Society of Psychology Congress (SIP) in México City and at the XII Interamerican Society of Psychology Congress, (SIP) in 1969 in Montevideo, Uruguay.

Following his contributions to the development of psychometric tests, Dr. Gilbert contributed in the creation of an attitude scale towards the role of women in society, based on the Facet Theory of Louis Guttman, and was invited as a Guatemalan professional, to integrate the Multi-national Center of Education and Research team, in Costa Rica in 1972.

From 1976 to 1995, he worked at Del Valle de Guatemala University, as the head of a postgraduate program for Latin American professionals in education, psychology, and other social sciences. This was a scholarships program, initially financed by the Ford Foundation, and then, for many years, by the Organization of American States. He evaluated and selected Latin-American professionals, who qualified for this scholarship.

He also worked as the professor of the Experimental Designs for Behavioral Research course, at Del Valle de Guatemala University.

Dr. Gilbert worked at his own psychological clinic, where he practiced adolescent, adult, and family psychotherapy.

He was selected as a member of the editorial board of the following professional magazines: *International Journal of Special Education*, *Interamerican Journal of Psychology*, *Spanish Language Psychology*, *ICCR Journal of Abstracts and Reviews*, and *Revista Latinoamericana de Psicología* (Latin American Journal of Psychology)

He also participated in national and international guilds and in psychological institutions; these were: President for the Central American area of the International Council of Psychology, from 1990 to 1991; Representative for the Central American area, of the Interamerican Society of Psychology, from 1994 to 1996. He was nominated Honorary Member of the Guatemalan Association of Psychology (Asociación Guatemalteca de Psicología) in 1996, also nominated Honorary President of the XXXII Interamerican Society of Psychology Congress in 2008 in Guatemala, and for last, was named Distinguished Professional by the Presidents of the Professional Guides Assembly of Guatemala, in 2009.

Dr. Gilbert is a pioneer of Psychology in Guatemala, which at his 91 years old, narrated this biography.

Aniela Meyer Ginsberg studied psychology and completed her master's degree in philosophy at Uniwersytet Warszawski (University of Warsaw) in Poland in 1927, when she wrote the dissertation "psychological analysis of fear." After the master's degree, she went to Germany and studied with Max Wertheimer (1880–1943) and Wolfgang Köler (1887–1967), founders of Gestalt Psychology, and also with Kurt Lewin (1890–1947), who formulated field theory and researched issues such as conflict and minorities. During the year 1927, which she spent in Germany, she visited in Paris the Psychotechnical Research Laboratory of Professor Jean-Maurice Lahy (1872–1943). In 1928, on his return to Poland, she began working at the Psychotechnical Laboratory of the Warsaw Federation of Industries.

Aniela Meyer came from an important Jewish family in Poland made up of bankers and businessmen, although she became a Catholic in her youth and adolescence. In 1928, she married Tadeusz Ginsberg (1878–1948), an executive at Handlowy, bank of a joint venture which included the Banca Commerciale Italiana (Italian Commercial Bank). Soon after her marriage, she accompanied her husband and lived for a few years in Italy, when she knew Agostino Gemelli (1878–1959) and Nicola Pende (1880–1970). In 1933, on her return to Poland, she received his doctorate at the same Uniwersytet Warszawski with the thesis "The psychological principle of contradiction." She also worked, for 2 years, in the Vocational Guidance Laboratory of the Warsaw City Hall (Colfield, 2018). At that time she made two study trips; in England, she visited Charles Samuel Myers' (1873–1946) National Institute of Industrial Psychology (NIIP), and in the USA she visited career guidance centers in Chicago and New York. Subsequently, Tadeusz became director of the French and Italian Bank to South America, which resulted in the couple coming to Brazil, arriving in São Paulo in February 1936.

In Brazil, Aniela Ginsberg started working, in 1936, as an assistant in the Laboratório de Psicologia Educacional da Escola Normal Caetano de Campos (Laboratory of Educational

Psychology of The Normal School Caetano de Campos) in São Paulo. Aniela participated, with Noemy da Silveira Rudolfer, in research about the use of psychological tests in students, so that in 1937 she became Rudolfer's assistant in the chair of Social Psychology at the Escola Livre de Sociologia e Política (Free School of Sociology and Politics, ELSP), an institution that was organized with the support and investment of industrialists and professionals with the intention of training with excellence technicians to serve in public administration. In 1941, Ginsberg took over as director of the vocational guidance center, linked to the Instituto de Organização Racional do Trabalho (Institute for Rational Labor Organization, IDORT) (May, 2015).

The invasion of Poland by Germany in the period of World War II, in 1939, resulted in a reaction of the Ginsberg couple who joined a group in São Paulo and formed the Relief Committee for victims of the war in Poland. This group was linked to the Brazilian Red Cross and aimed to forward medicines, clothing, supplies, and donations to the Polish Red Cross.

Aniela Ginsberg worked between the years of 1943 to 1946 as a technical assistant of the division of selection and professional orientation of the Serviço Nacional de Aprendizagem Industrial (National Service of industrial learning, SENAI). In 1946 she left her activities in São Paulo to accompany her husband, who was transferred to Salvador (BA). In this city, she taught courses on test application techniques and measuring individual differences at the Faculdade de Filosofia, Ciências e Letras (Faculty of Philosophy, Sciences, and Languages), now Universidade Federal da Bahia (Federal University of Bahia, UFBA).

In the year 1948, the couple moved to Rio de Janeiro, where Aniela worked at the Instituto de Seleção e Orientação Profissional (Institute of Selection and Professional Guidance, ISOP) of the Getúlio Vargas Foundation, an institution that had as its director Emilio Mira y López, and who created, in 1949, the journal *Arquivos Brasileiros de Psicotécnica (Brazilian Archives of Psychotechnics)*, considered the first academic journal of psychology in Brazil. In this journal,

Aniela published some articles. One of these articles, published in 1951, focused especially on ethnic issues, and she presented the results of research on mental level tests applied in different ethnic groups (Castro et al., 2020).

In addition to the performance in work psychology, Aniela Ginsberg has made an important contribution to shaping a psychosociological perspective regarding ethnic-racial relations in Brazil, since she conducted research on possible psychic, behavioral, and cognitive differences among different individuals in ethnic groups, and analyzed racial prejudice in the context of the Unesco Project (May, 2015).

Some of her works were part of what became known in Brazil as the “Unesco project.” In the 1950s, in the post-war scenario, the United Nations Educational, Scientific, and Cultural Organization (Unesco) implemented a series of studies on ethnic-racial relations in Brazil. The attempt to overcome Nazism’s experience of racism and eugenics considered Brazil, because of its historical experience of miscegenation (and the myth of racial democracy), as an appropriate social environment for research on the subject. These researches were carried out in different regions of the country, with the participation, in addition to Aniela, of researchers such as Roger Bastide (1898–1974), Florestan Fernandes (1920–1995), and Virginia Bicudo. The Unesco project contributed to the emergence of a new look at the perspective of Brazilian ethnic-racial relations. In this period, Aniela became one of the main authors, along with Dante Moreira Leite and Virginia Bicudo, to dedicate to the theme of interculture and race relations in Brazilian psychology. Her studies on ethnic-racial relations opposed the deterministic and biological perspective on racial differences, demonstrating the sociocultural construction of these inequalities (Cunha & Santos, 2014). Aniela had been appointed to this project by Otto Klineberg, and her research became a chapter in the 1955 Unesco book.

Aniela naturalized in 1950 as a Brazilian citizen and continued her professional career returning to São Paulo. She became coordinator of the Psychological Clinic of the Institute of

Psychology of the Pontifícia Universidade Católica de São Paulo (Pontifical Catholic University, PUC-SP), between the years 1959 and 1962, and later participated in the creation of the Master’s Degree in Social Psychology of the same university, where, in 1972, she assumed the coordination of the newly created doctorate in social psychology.

In 1988, 2 years after his death, a nonprofit foundation was created, aimed at encouraging research in psychology. Installed definitively in 1991, the Aniela and Tadeusz Ginsberg Foundation (FATG) derived from Aniela’s effective desire expressed in her will to assist low-income students.

Giorgi, Amalia Beatriz

Born *Metileo, La Pampa Province, Argentina, 8 January 1944*

Died *Neuquén, Argentina, 26 January 2017*

María Cecilia Petit

Universidad Católica de Córdoba, Córdoba, Argentina

Keywords

Argentina · Child psychoanalysis · British Psychoanalytical School · Professional training · Institutions

Born in La Pampa province, Amalia Beatriz Giorgi traveled to Córdoba as an Elementary School Teacher ready to start her Psychology Degree studies. She graduated as Professor in Psychology in 1968 and as Psychologist in 1969, both titles obtained at the Universidad Católica de Córdoba (Catholic University of Córdoba). In 2006, she

obtained a postgraduate degree in Clinical Psychology by the Universidad Empresarial Siglo 21 (twenty-first Century Business University).

From the beginning, she embraced university teaching, motivated by the education of young students. Since 1971, she has been a Professor on the Psychology Program at the Universidad Nacional de Córdoba (National University of Córdoba, UNC) in the course Dynamic Psychology, later named Psychoanalysis, and the course Child Clinic. From 1971 to 1975, she was in charge of other courses: Psychodiagnosis, Psychopathology, Clinical Psychology, and Psychotherapeutic Techniques, all of them at the Catholic University of Córdoba, UCC. Since 1999 her teaching activity focused on Psychotherapy and Professional Practice with clinical orientation at the twenty-first Century Business University (UES21). There she was Director of the Master Program in Clinical Psychology, from 2007 to 2011, program she contributed to establish with enthusiasm and dedication. This important training proposal for psychology professionals in the clinical area, first of its kind in the contexts of Córdoba, is one of her most outstanding contributions to the academic field. As a psychoanalyst, she accompanied and supervised the work of generations of psychologists who were starting out in their psychoanalytic clinical practices.

From 1986 to 1988, she was Director of the Departamento de Psicología (Psychology Department) on the Facultad de Filosofía y Humanidades (Faculty of Humanities and Philosophy), at the National University of Córdoba. During that crucial period for Argentine history and their educational institutions, during the restoration of the democratic order after December 1983, it began an important process of reconstruction and renovation of university education. Being part of this quest, she promoted a plurality of thought by calling different personalities who represented several current theoretical perspectives to this ongoing project. The creation of the new Curriculum for the Psychology Program, developed during her administration and still active until 2020, implied a decisive founding academic milestone where the diversity of theoretical approaches that housed the discipline was formally incorporated.

Her work as a Professor at the University was interrupted between 1976 and 1984 because of the Argentine military dictatorship. However, Amalia Giorgi like other colleagues was able to continue her teaching commitment, displaying resourceful creativity in other areas of training such as the Asociación Psicoanalítica de Córdoba, APC (Psychoanalytic Association of Córdoba) and remained counseling, guiding, and supervising students' work as well. In 1985, with the reestablishment of the democratic order and the consequent University normalization, she was reinstated to the chair of Dynamic Psychology in the Psychology Program at the National University of Córdoba.

Due to her psychoanalytic clinic transmission skills, she was summoned by different public and private institutions linked to professional training, an area where she developed an intense teaching activity.

Among her written productions we can mention "La fusionalidad: una hipótesis para pensar" (Fusionality: a hypothesis to think about) (Banhos et al., 1998), *El Psicoanálisis en tiempos de crisis* (Psychoanalysis in times of crisis) (Giorgi, 2002), "Argentina, Cambalache and Omertá" (Banhos et al., 2002). Throughout her career, she was awarded the Fepal Prize by the Latin American Psychoanalytic Federation.

Her contribution to the field of psychology and psychoanalysis in Córdoba stood out for the transfer of the British School of Psychoanalysis, child psychoanalysis, and current psychoanalytic thought, particularly Italian, translating contemporary thinkers such as Antonino Ferro (1947–) and Riccardo Romano (1946–). In 1998, she assembled with other analysts the *Sigma Group*, a powerhouse for thought, capable of brainstorming powerful ideas expressed in different written productions. As a member, Amalia contributed to broaden the field of post-Kleinian psychoanalytic thought taking steps towards more collective and social issues crafting concepts such as *Total Groupness* and *Group Reverie*.

The place of women in society and psychoanalysis was another subject of intellectual concern, preoccupation, and development. She stood out for her teaching vocation, cultivating and

promoting critical thinking. Generously sharing her knowledge, experience, and steadfast in her efforts contributing to the training of psychologists. Her clearly democratic attitude, always respectful of others thoughts, led her to stimulate both plurality of theoretical approaches and dialogue with other disciplines, especially sociology and anthropology, and to establish connections between institutions and groups. The same firmness and perseverance in her ideas was coherent in her convictions. This allowed her to continue to practice her passion for teaching in diverse ways and environments. Always with the same enthusiasm, joy, and dedication that distinguished her since her youth.

Jaime Giraldo Ángel's birthplace, Anserma, was founded during the sixteenth century, and it is land of coffee and mountains. That environment shaped the first years of his life and, later on, his first professional years.

He obtained his degree as a lawyer from Universidad Externado de Colombia (Externado University of Colombia) (1952) and his psychology degree from the Universidad Nacional de Colombia (National University of Colombia). He studied both careers at the same time and, after completing them, returned to Anserma at the age of 24, where he held the position of criminal judge of the circuit of the region. Upon his return, he met Ayda Lucy López with whom he would spend the rest of his life. They got married on September 24, 1954, and had eight children.

By the end of the 1950s, he had obtained a specialized degree in higher education at the University of California, the USA (1957), and a doctorate in psychology from the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (1955).

In an academic context, he was a professor at various universities in Colombia such as the National University of Colombia, Externado

University of Colombia, Universidad de los Andes (University of the Andes), and Universidad Militar Nueva Granada (New Granada Military University). At the National University of Colombia, he was in charge of teaching general psychology, psychology of adolescence, psychology of adulthood, and contemporary schools of psychology, showing the breath of his interests and knowledge (Universidad Nacional de Colombia, 1958).

He was also a researcher at the Instituto SER de Investigación (SER Research Institute) in Bogotá, an independent institution dedicated to the study of social and justice problems in Colombia (Reyes Alvarado, 2017). He was also the director of the Judicial Career (1976), magistrate of the Colombian Supreme Court of Justice (1989), president of the Superior Council of Judicial Administration (1990), minister of justice (1990), and magistrate of the National Bioethical and Psychological Court (2007).

In the mid-1980s, he had to face the toughest challenges of his public career, when, “with drug trafficking on the crest of its wave of terrorism” (*El Tiempo*, 2014), he was appointed as magistrate of the Criminal Chamber of the Supreme Court of Justice, replacing Magistrate Hernando Baquero Borda (1929–1986), who was killed by the Medellín Cartel in Bogotá on July 31, 1986.

In 1989, after the assassination of presidential candidate Luis Carlos Galán (1943–1989), president Cesar Gaviria (1947–) consulted with him on a number of issues related to the situation of justice and violence in Colombia. His input on these matters was instrumental to be appointed as minister of justice on August 7, 1990. From that ministry, he promoted the policy of submission to justice as well as “Justice without a face.” These were fundamental mechanisms to combat and counteract the onslaught of narco-terrorism that filled the country with blood and bereavement for more than ten years. He was instrumental in capturing drug dealers such as the Ochoa brothers (Juan David, Jorge Luis, and Fabio) and Pablo Escobar (1949–1993) himself. Likewise, as part of the government, he led justice reforms that were included in the National Constituent Assembly in 1991. He concluded his participation at the state level as a judge of the Superior Council of the Judiciary.

Once he concluded his career as a lawyer and an academic, he agreed to support the Colegio Colombiano de Psicólogos (Colpsic) (Colombian Board of Psychologists) and specifically the National Deontological and Bioethical Court of Psychology created by Law 1090 of 2006. In September of 2007, Colpsic created the National Court and appointed Giraldo as its first presiding magistrate who initiated pioneering work for Colombian psychology at that time. Giraldo and other psychologists who were appointed as magistrates of the National Court, were responsible for launching the court, “. . . always with the conviction of the pedagogical work that should be carried out, first and foremost, to train psychologists for a good professional practice and then punish the breach of duties as psychologists” (Giraldo, 2014a, b, p. 2). “There were many hours of debate and reflection and much of Dr. Giraldo’s generosity to instruct the psychologists who were members of the Court in the verdicts of legal argumentation. . . what patience he showed and how much we learned!” (M. Restrepo, personal communication, February 24, 2012) were the words of some of psychologists who were part of the first National Court.

Under his leadership and with his legal and ethical contributions, the first documents and agreements of the courts about ethics law and deontology in psychology were drafted. The Deontological and Bioethics Manual of Psychology in Colombia has his distinctive trademark (Colegio Colombiano de Psicólogos, 2016), and in its essay on ethics and law he states the following: “I began to write this document as a collaboration so that the psychologists who were appointed as Magistrates of the Courts of Ethics would not stumble when carrying out their position within the current legal system, especially the one established by the law 1090 of 2006, but I soon discovered that it would provide a better service to the judges and lawyers of our country, who have been basically trained within the epistemological assumptions of the School of Legal Positivism. . .” (Giraldo Ángel, J., 2011, p. 184, quoted in Giraldo Ángel, J., 2013).

Throughout his life, Jaime Giraldo was a teacher in social and legal research. “I was

convinced that the Law should be a cultural product of the people and, therefore, it was impossible to separate it from social reality” (Giraldo Ángel, 1997, p. 15). For him, the Law “should be a functional tool for social change and norms should be the logical consequence of the country’s socio-political analysis” (Giraldo Ángel, 1997, p. 16). His academic work, in particular the three methodologies developed in his professional career, begins with a deep reflection about the characteristics of the argumentation expressed in the “Methodology of bibliographic research” (2012) and concluded with a profound analysis of the role that law should play in current societies, included in his work “Methodology of socio-legal research” (2012). The book *Methodology of legal research* (2012) is a work that constitutes an exceptional text to understand law as an applied science.

In 2013, he wrote in the preface of *The Ethical in the Law* the following: “When I tried to make psychologists understand that the rules were abstract postulates, that could be filled with universal and absolute values, or with imperative mandates of ‘Sovereignty’, they made me understand that Ethical Law would be meaningless if it is not linked to social reality, which implied a diametrically position opposed to the one I was trying to communicate. This led us to think that an Ethical Law has its own identity, often incompatible with the other conceptions of Law”.

Jaime Giraldo Ángel made important contributions to both law and psychology, and through those areas, he left a lasting legacy of public service in Colombia.

Octavio Giraldo Neira did his elementary school and university studies in Jesuitical institutions in Colombia, receiving a Doctoral degree in Philosophy (Doctor of Philosophy and Letters) from the Pontificia Universidad Javeriana [Pontifical Javeriana University] (1961) and then a Master of Arts in Clinical Psychology from the University of Arizona (1964); he studied a Specialization in Education from the State University of Michigan (1970) and did Postdoctoral Training in Sexual Therapy at the University of Washington (1978). After that, he did a visiting scientist internship in the Psychohormonal Research Unit and Biosocial Clinic at Johns Hopkins Hospital and School of Medicine (1983) where he met John Money (1921–2006), a well-known psychologist – sexologist and researcher on sexual orientation and gender identity issues. As another facet of academic interest, Giraldo did complementary administration studies at the Universidad del Valle [University of Valle], Colombia (1976).

With his knowledge on sexology and the influence of Money, he was a founder of sexological research and training in medicine and psychology in Colombia, initiatives with a wide impact in several germinal sexological institutions in Colombia and Latin America. His academic influence is related with his teacher position at the University of Valle in 1967, where he and his team (including feminist psychologist María Ladi Londoño) developed the first course on sexuality within a specific curriculum in population studies, titled “Experimental Course on the Concept of Modern Sexuality,” in 1968. Along the years in the early 1980s, the course was expanded to be more than a specific training for students to include professionals and the general public; in the mid-1980s, the course (and sexology) had a nationwide impact (Brigeiro and Facundo 2013).

At the same time of the development of the sexuality course, Giraldo wrote, in 1981, the first academic textbook on human sexuality in Latin America, called *Exploring Human Sexualities. Psychosocial Aspects*, with seven editions between 1990 and 1997.

In the 1980s, the introduction of sexological ideas in medical and psychology perspectives in

Colombia was linked to the interest of governmental educational organizations (Colombian Institute for the Promotion of Higher Education, ICFES) and the advocacy of sexological associations, the Colombian Sexology Society, the World Association for Sexual Health (formerly World Association of Sexology), and the Latin American Federation of Sexology and Sexual Education (Facundo and Brigeiro 2014). Giraldo's leadership as a founder and active member of those organizations is remarkable, especially in the context of the golden era of the sexological studies in Latin America, with an interest in political and libertarian agendas in the middle of tensions emerging from the discourse of sexual diversity and reproductive/human rights, the decriminalization of homosexuality in 1980, the HIV/AIDS crisis, and the conservative pervasive values around sex and sexuality in a post Stonewall US sexual revolution. Giraldo's psychosocial-sociocultural perspective in the analysis of human sexualities led to non-pathological psychological research on homosexuality in Colombia (Giraldo 1971), as well as definitions of sexual identity in which cultural conditions and socialization are predominant (Giraldo 2002).

As a major stance on scientific evidence in human sexuality issues, Giraldo established, edited, and directed the *Revista Latinoamericana de Sexología* [Latin American Journal of Sexology] in 1986, position he held for 7 years. He also coordinated the first sexology congresses in Colombia, which had a great impact at national and international levels.

Giraldo's leadership in sexology is well recognized; he was the first vice president and president of the Latin American Federation of Societies of Sexology and Sex Education (between 1986 and 1991), a special member of the Peruvian Society of Sexology, and foreign honorary member of the Chilean Society of Anthropological Sexology.

As major recognitions, he received the Distinction Medal of Latin American Sexology (2002) and the Colombian Psychology Award, Life and Work Category (2012). For his extensive and influential academic work, the University of Valle acknowledged him as Distinguished

Professor in 1985. In the area of cooperativism, he also stood out receiving the Latin American Emeritus Educator (1993) from the Latin American Association of Cooperative Education Centers.

His legacy is present in the link between academics, institutions, and social activism; the interdisciplinary link between psychology, medicine, and other professions through a humanistic perspective in the understanding of human sexualities; the structuring of a specific field such as professional clinical sexology in Colombia and Latin America; and the power of institutional advocacy in the incidence on large-scale public policies in sexual education in the region.

Chilean psychologist, born in Santiago de Chile on 8 March 1941. Jorge Gissi obtained his *Licenciatura en Psicología* (Psychology BA) and his clinician's license at *Universidad Católica de Chile* (Catholic University of Chile; henceforth: UC) in 1967, his *Magíster en Letras – mención Literatura Latinoamericana* (Humanities MA specializing in Latin American literature) at the same university in 1978, and his *Dottorato in Scienze Sociali* (Social Sciences PhD) at *Pontificia Università Gregoriana* (Rome) in 1985. At UC, he served as vice principal of the *Escuela de Trabajo Social* (School of Social Work) from 1970 to 1971 and as head of the *Escuela de Psicología* (School of Psychology) from 1990 to 1992. In 1992, Jorge Gissi founded and served as first head editor for UC's School of Psychology scientific journal *Psykhé*. Jorge Gissi belongs to the first generation of Latin American psychologists that addressed the region's great social problems from an academic standpoint.

In 1968, he joined the *Instituto Nacional de Desarrollo Agrícola* (INDAP) (Chilean Agricultural Development Institute) alongside others who – following the lead of Brazilian educator Paulo Freire – propelled the Chilean agrarian reform, set by President Frei Montalva and INDAP's assistant secretary at the time, Jacques Chonchol. In 1971, he became part of the *Centro de Estudio de la Realidad Nacional* (CEREN) (Center for National Actualities Studies) – created in 1967 by rector Fernando Castillo Velasco at UC – until it was shut down in October 1973 by the military government's junta newly appointed

rector. At UC, Jorge Gissi was an appointed faculty member at the School of Social Work between 1969 and 1978, and at the School of Psychology starting from 1981, teaching Critical Social Psychology, Psychology of Poverty, Culture and Personality in Latin America, Psychology and Religion, Existential-Humanistic Psychology, Systems Theory of Communication in Psychology, and Women and Society, among others.

As one of the forerunners to Critical Social Psychology in Latin America, he has become an important source in Latin American identity studies (Arnold 1990; Isla-Monsalve 2019; Martín-Baró 1983; Montero 1990). His first publications already dealt with the psychological aspect of Latin American sociocultural issues: capitalist alienation (Gissi 1971), classism and authoritarianism (Gissi 1972a), psychology of religion (1987a), and poverty culture (Gissi 1990, 1992). His essays on *machismo* and on the mythology of femininity (Gissi 1972b) continue to be influential for Latin American progressive feminism (Felitti 2010; Gil-Lozano 2010; Grammatico 2005).

Gissi is also one of the precursors of the relationship between cinema and psychology as a theme, which he developed during the 1970s in his courses, talks, and publications (Gissi 1974), contributing to the reincorporation of aesthetics to the study of the psyche. Autonomous thought and transdisciplinarity are interrelated features present along the span of Gissi's work. His writings propose a synthetic view of theories that emerge from a range of disciplines, mainly, psychology, psychoanalysis, sociology, and anthropology. It is important to acknowledge that his personal inquiry does not endorse well-established theories or views unheedingly. This is particularly valuable when it comes to his use of psychoanalytic and neo-Marxist concepts.

Consequently, his writings sought to offer a synthetic view and do not lend themselves to be classified within traditional schools of thought. Such character can be particularly captured in his studies on Latin American identity, one of his most original contributions. In his book *Identidad Latinoamericana: Psicología y sociedad* [Latin American identity: Psychology and society]

(1987b), Gissi develops insightful analyses built upon psychological theories of identity and the trauma of Hispano-American occupation, its historical consequences, and perpetuation. In this context, he introduces the fruitful concept of “alienated ethnocentrism” [*etnocentrismo alienado*] to describe the characteristic Eurocentric bias of Latin American peoples and its psychosocial implications. In *Psicología e identidad latinoamericana* [Latin American psychology and identity] (2002), he further develops his analysis of the region’s panorama by introducing an interpretation of key authors in Latin American literature.

His coauthored book *Nuevos asedios a la psique latinoamericana* [New sieges on the Latin American psyche] (Gissi and Sirlopu 2007) is also worth mentioning. He was awarded with the best essay prize in 1981 by the *Centro Pastoral Familiar para América Latina* (Bogotá) (Pastoral Family Center for Latin America) for his manuscript on Latin American family; then received the *Premio Nacional de Psicología* (Chilean National Psychology Award) in 1987 by the *Colegio de Psicólogos de Chile A.G.* (Chilean Psychologists Society) and was recognized by the undergraduates as Outstanding Faculty Member by UC’s School of Psychology in 1988 and, by his colleagues, in 1993. Jorge Gissi has been an invited speaker in various countries, such México, Colombia, Ecuador, Argentina, Bolivia, Paraguay, Costa Rica, Spain, Germany, Belgium, and Italy (Camus and Muñoz 2017; Cohl and Cornejo 2018; Riquelme 2001).

Goldenberg, Mauricio

Born *in Buenos Aires, Argentina, August 31st 1916*

Died *in Washington, United States, September 12th 2006*

Sergio E. Visacovsky
 Centro de Investigaciones Sociales, Instituto de Desarrollo Económico y Social/ Consejo Nacional de Investigaciones Científicas y Técnicas, Buenos Aires, Argentina

Keywords

Argentina · Venezuela · Psychiatry · Reform · Lanús Hospital

Mauricio Goldenberg was an Argentine psychiatrist, who advocated an important reform of the psychiatric care system in the country, which reflected very especially in a celebrated psychiatric service in a general hospital, usually referred to as “Lanús,” between 1956 and 1972. He was the youngest and only male of four brothers, whose parents were Ukrainian Jews. After completing his primary and secondary education in Buenos Aires, he graduated in medicine from the Universidad de Buenos Aires (University of Buenos Aires) in 1945. With Carlos Pereyra (1903–1990) as his thesis advisor, Goldenberg addressed the clinical aspects of alcoholism. He carried out his specialization in psychiatry at Hospicio de las Mercedes (currently, “José Tiburcio Borda” psychiatric hospital), in which

Gonzalo Bosch (1885–1967) was the director. There he met Enrique Pichon Rivière (1907–1977) and Celes Cárcamo (1903–1990), founding members of the Asociación Psicoanalítica Argentina (Argentine Psychoanalytical Association, APA) in 1942, who introduced him to psychoanalysis. Also, he maintained close contacts with psychiatrists Eduardo Krapf (1901–1963), Mario Sbarbi, and Enrique Mo Gatti. Later and for a short time, he became interested in immigration from a eugenic approach, usual at the time. Goldenberg started his professional career in the Liga Argentina de Higiene Mental (Argentine League of Mental Hygiene, created in 1929), being part of the board of directors and providing patient care in the offices. He participated in the main medical, psychiatric, and neurological associations, usually publishing in their journals. In the late 1940s he became interested in the physiological treatments generated in the previous decade: lobotomy, electroshock (the earlier terminology for electroconvulsive therapy with electric shocks to the skull), and electroprexia. He was also concerned with epilepsy, sundowning, and involuntal psychosis. After pursuing postgraduate studies in psychiatry at the Facultad de Medicina (Faculty of Medicine) at the University of Buenos Aires, he joined the chair of Psychiatric Clinic at the same university, where Bosch was a full professor. As a matter of fact, Bosch supported him to make a trip through Europe with the main purpose of attending the First World Psychiatry Congress (1950) in Paris, meeting some prestigious professionals and visiting their institutions. In addition to being present at the conference, in Paris Goldenberg met the famous Spanish neuropsychiatrist and psychoanalyst (French nationalized) Julián de Ajuriaguerra (1911–1993) at the Sainte-Anne Hospital; in London, he visited the Bethlem Royal Hospital, where labor therapy was practiced; in Birmingham, the Northfield Military Hospital, where experimental treatments of war neuroses and shell shock were carried out through group therapies and therapeutic communities; in Italy, he met Ugo Cerletti (1877–1963) and Lucio Bini (1908–1964), inventors of electroshock; and in Spain, Juan José López Ibor (1906–1991), a

psychiatrist related to the national Catholic sectors of the dictatorship of Francisco Franco (1892–1975). After the coup d'état of 1955 that overthrew the government of Juan Domingo Perón (1895–1974), the neurosurgeon Raúl Carrea (1917–1978), in charge of the Dirección de Salud Mental (Direction of Mental Health) created in 1956 (the next year, Instituto Nacional de Salud Mental, National Institute of Mental Health), summoned Goldenberg to integrate an advisory commission. That was the step before Goldenberg took over the leadership of a new Psychopathology and Neurology Service at the “Dr. Gregorio Aráoz Alfaro” Polyclinic (today, Hospital “Evita”) on October 1, 1956. The service was located on the outskirts and south of the city of Buenos Aires, in Lanús city, province of Buenos Aires. Under Goldenberg's guidance, it became an exemplary institution, an inspiring model for other institutions in the country and Latin America. Goldenberg set out to build a new model to treat mental illnesses, opposite to the asylum conception of traditional psychiatric hospitals. The serious situation of overcrowding and mistreatment of hospitalized patients in psychiatric hospitals had been reported on numerous occasions since the first decades of the twentieth century (Ablard, 2008; Balán, 2001; Plotkin, 2001, 2003; Visacovsky, 2002). Goldenberg understood that in order to undertake the reform of the psychiatric care system, both a substantial improvement in the conditions of hospitalization of patients and the introduction of new forms of treatment were essential. On his European tour, Goldenberg could see that the conception of psychiatry was changing sharply after the end of World War II. Although many changes had been driven by the Mental Hygiene Movement (of which Bosch was the most important local spokesman), the new psychiatry required greater integration with the rest of the medical areas. This change came from a broader notion of health, which included psychological aspects. As a corollary, the notion of “mental health” displaced “mental hygiene.” In order to fulfill the intended integration of psychiatry as a medical specialty, this new trend recommended the creation of psychiatric services in general hospitals. The creation

of the “Lanús” service and the Goldenberg project must be understood in this context. This service was not the first in Argentina, but it was unique in terms of its achievements, so it is remembered as an exemplary case. Goldenberg's institutional model was based mainly on dynamic psychiatry, that is, psychiatry with a strong psychoanalytic influence, following the French psychiatrist Henry Ey (1900–1977), the model of therapeutic community, according to the English psychiatrist Maxwell Jones (1907–1990) and the project of community psychiatry, which sought to reduce the hospitalization times of patients. Based on the latter, a program called “social psychiatry” was developed that carried out prevention activities in the humble neighborhoods surrounding the hospital. Although the service had a hospitalization area for patients, the institutional approach favored short-term hospitalizations and outpatient treatments. Individual and group psychotherapy with a psychoanalytic approach had a broad development, maintaining a regular and close contact with the main representatives of local psychoanalytic institutions like APA (Balán, 1991; Plotkin, 2001; Visacovsky, 2002). Because of the success of psychoanalysis in Argentina in the 1960s and the creation of psychology careers in universities such as UBA (where psychoanalysis prevailed as a predominant perspective), the service became a desirable professional training space (Dagfal, 2009). Anyway, resources of medical psychiatry, such as psychopharmacology, continued to be implemented. In the mid-1960s, the service created and led by Goldenberg had great prestige, serving as a model for other institutions and even public policies in mental health. In 1967, during the Juan Carlos Onganía military dictatorship, Goldenberg was summoned by the Institute's auditor, neurologist Colonel Julio Ricardo Estévez, in order to carry out a plan for the modernization of psychiatric care in Buenos Aires city; this transformation consisted of the creation of mental health centers, psychiatric services in general hospitals with outpatient offices, and the development of therapeutic communities. In 1972 Goldenberg left his position at Lanús service, which was filled by one of his disciples, Valentín Barenblit (born in 1932), because he

decided to direct the psychiatric service of the Hospital Italiano (a private institution in Buenos Aires city, founded in 1961 by his former graduation thesis advisor, Carlos Pereyra). The coup d'état of March 24, 1976, that gave rise to the military dictatorship and the establishment of state terrorism (which followed a climate of political violence that the country lived in the first half of the 1970s) severely hit the continuity of institutional projects such as Lanús (Carpintero & Vainer, 2004; Plotkin, 2001; Visacovsky, 2002; Vezzetti, 2009). Goldenberg was forced into exile in Caracas, Venezuela. His daughter Liliana Inés, also in exile, committed suicide in 1980, to avoid being captured by Brazilian and Argentine police when she tried to return; his son Carlos, a militant of Montoneros, was killed by the police (his wife Adelaida Viñas, daughter of the writer David Viñas, was murdered shortly after) (Anguita & Caparrós, 1998). In Caracas, Goldenberg developed his professional activity in his own office; in addition, he was a professor of Psychiatric Clinic in a postgraduate degree that depended on the Ministry of Health and the Central University of Venezuela. When democracy returned in 1983, Raúl Alfonsín's government summoned him to assume as national director of Mental Health. Although he advised on the preparation of a Plan Nacional de Salud Mental (National Mental Health Plan), Goldenberg declined the offer; he preferred to continue living in Venezuela carrying out his usual activities, besides serving as a Pan American Health Organization consultant. To lead the national mental health area, he recommended another disciple, Vicente Galli. During the 1990s, Goldenberg made some visits to Argentina, especially to attend tributes to his career. In 2001 he settled with his wife Isabel in Washington, DC, where his daughter and several of his grandchildren already resided and where he lived until his death in 2006.

Keywords

Mexico · Creation of school of psychology · Society of Jesus

The teacher Ramón Gómez Arias, S.J., was the founder of the Escuela de Psicología (School of Psychology) at Centro Cultural Universitario (University Cultural Center) (CCU) in 1950, which changed its name to Universidad Iberoamericana (Iberoamerican University) (Ibero) in 1952 (Meneses, 1976). It was the second school for professional studies of Psychology

in Mexico, created just 5 years after the first one founded by the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM) in 1945 (Lafarga, 1995).

His religious calling led him at the age of 16 to enter the Compañía de Jesús (Society of Jesus) on September 9, 1929, at the Novitiate of Ysleta College. He was ordained as a Jesuit priest on June 13, 1945, and made his last vows on September 8, 1945 (Páramo, 1975). His first mass was celebrated in Our Lady of Guadalupe Church in Chicago on June 14, 1945.

At Ysleta College, he studied the subjects of his priestly training at the Faculty of Arts from 1930 to 1934. The following 4 years, he studied teaching at the Faculty of Philosophy and Science at the same institution until 1938. Afterwards, he studied Theology for 3 years at West Baden College, Indiana. He also studied a Master's Degree in Experimental Psychology at Fordham University, in New York where he graduated in 1947. Gómez Arias (1944) expressed his motivations for studying Psychology: "My dream would be to create a laboratory in psychology in our homeland, psychometric institutes in colleges, and thus work more efficiently on the great educational problem that seems to me fundamental in Mexico" (p. 1).

According to Pérez Alonso (1991), Gómez Arias alternated teaching with ministry work. He specialized in psychology, and the foundation of his career was at the IBERO, where he served as director from 1950 to 1955. He also founded the Centro de Orientación Vocacional (Vocational Guidance Centre) and a school for children with cognitive impairments, the Loyola School, which was linked to the IBERO (Pérez Alonso, 1991).

Gómez Arias' interest in a school that focused on the latest advances in psychology led him to carry out two fundamental actions: he first laid the foundations for a specialized library in Psychology that was later expanded by Ernesto Meneses Morales, S. J. (Pérez Alonso, 1991). According to Meneses (1976), the state of psychology in Mexico at the beginning of the 1950s was precarious since the advances achieved in the United States and Europe were practically unknown, with the texts used as primary sources by authors from the

late nineteenth and early twentieth centuries, such as Binet, Cannon, Freud, Gemelly, Janet, Koffka, Kretschmer, Ribot, and Wundt. On the other hand, Gómez Arias convened notable teachers of the time in the field of psychiatry at IBERO, such as Manuel Falcón, Roberto Flores Villasana, Francisco González Pineda, Manuel Guevara Oropeza (1899–1980), the philosopher José Luis Curiel, the criminologist Quiroz Cuarón (1910–1978), and, in industrial psychology, German Herrera (Meneses, 1976).

At the Centro Cultural Universitario (University Cultural Centre) (1952), in the Faculty of Psychology, he was in charge of important courses such as, in the first year, Applied Statistics in Psychology and Education and an introductory course in Psychology of Religion. In the second year, he was in charge of a second-year course in Psychological Research Techniques (Psychometry), a second-year course in Psychology of Religion and Philosophical Psychology, a second-year course in Statistics applied to Psychology and Education. In his third year, he also oversaw a third-year course in Psychology of Religion and a course in Somatology and Biotypology (character psychology). He taught a course in Experimental Psychology in 1953 and also taught psychology subjects in the Departamento de Ciencias de la Educación (Department of Educational Sciences) such as training and estimation of mental tests and Somatology and Biotypology.

In 1952, the CCU adopted the name of IBERO, and 2 years later the Universidad Iberoamericana, Asociación Civil (Iberoamerican University, Civil Association, IBERO) (Universidad Iberoamericana, 2017) was established. Gómez Arias continued as director of the Facultad de Psicología (Faculty of Psychology) until 1955, being replaced in July by Ernesto Meneses Morales (Meneses, 1976). Later, in 1959, Gómez Arias was director of the Centro de Orientación Profesional (Centre for Professional Guidance) in Guadalajara. He was also director of the Centro de Orientación Profesional (Centre for Professional Guidance) in Chihuahua and the Confederación de Alumnos (Confederation of Students) in Monterrey. He collaborated with the Centro de Información y Acción Social,

A.C. (Centre for Information and Social Action), in Torreón, Coahuila. He founded and collaborated with the Pio XII Institute at the Facultad de Teología para seculares (Faculty of Theology for Laypeople), in Guadalajara, Jalisco, in 1961. Gómez Arias was also founder and director of the Congregación Mariana Universitaria de la Inmaculada Concepción y San Javier (Marian Congregation University of the Immaculate Conception and San Javier), in Mexico City.

The key contributions of Ramón Gómez Arias were in the field of psychology and his priestly life. His priesthood, according to Pérez Alonso (1991), was exercised mainly through Marian congregations between university students and spiritual guidance between students and professionals. Most notable in the field of psychology is Ramon Gómez Arias' strong interest and actions in consolidating psychology as a scientific endeavor, in the context of the IBERO and Mexico.

Educational Psychology · Intellectual and Functional Diversity · Residential services for a population with diversity

María Elisa Gómez was the only child of Elisa Martínez, a housewife, and Pablo Gómez, a telegraphist. She went to the public primary and secondary schools of her hometown and when she finished high school entered the College of Agriculture and Mechanical Arts (CAAM), of the University of Puerto Rico (today University of Puerto Rico, Mayagüez Campus). She earned a Bachelor of Science degree in 1928. She was among the first three women that graduated from CAAM.

As soon as María Elisa graduated, she got married to her first husband, Rafael Delgado Marques, and moved to Caguas where in 1930 she started teaching chemistry in the Caguas public high school and took courses in psychology

and education at UPR-RP. She got pregnant with her first child and had difficulties during her pregnancy, and her son was born in 1934 with developmental difficulties and was later diagnosed with severe mental retardation (M. L. Tolosa, personal communication, August 19, 2020). At this time in Puerto Rico, there were no schools, special education programs, or boarding facilities for these special persons. The stress that the birth of Rafaelito Delgado Gómez put on this young couple, especially on the mother who worked as an educator, made her family life very difficult. Her marriage ended, and María Elisa Gómez decided to move to New York City in the United States to look for opportunities to stimulate and develop her special son. She also decided to undertake graduate studies in psychology and mental retardation and entered, in 1943, Teachers College at Columbia University. By educating herself in the area of her son's diagnosis, she was getting ready to offer her son any available opportunities to develop his potential.

María Elisa Gómez obtained in 1944 a masters of art in psychology with emphasis in mental retardation and continued studying toward her doctoral degree until 1946. Around 1946, she married again, this time to Pedro Rafael Tolosa Bras, an engineer whom she had met while studying at CAAM a long time ago. Her new husband Pedro was a widow and had two adolescents, Marie Lucille and Pedro Enrique, whom she helped raise as their children. After a while, the new couple had a child of their own, José Enrique.

María Elisa Gómez returned to Puerto Rico in 1946. She wanted to develop in Puerto Rico a place where her son would fully develop his potential, surrounded by a warm, happy environment, full of love and support, a place where he would learn to play and be happy (M. L. Tolosa, personal communication, August 19, 2020). María Elisa started working as a psychologist (1946–1952) and director of the Office of Services to the Handicapped (1953–1957), Division of Public Welfare at the Department of Health of the government of Puerto Rico. She was later executive secretary of the Children's Commission (1957–1964) and director (1964–1967) of Planning and Coordination of Mental Retardation

Program. She offered services to children with mental retardation and especially helped their families adapt to their child's conditions and orient them to look for alternative services.

Since there were still no services available for children with developmental or intellectual diversity in Puerto Rico, she decided to meet with these parents after work in order to look for alternatives. After a while, María Elisa suggested looking for funds to initiate a school with residential facilities. They initiated a public funding campaign and were able to establish in 1949, the *Instituto Psicopedagógico de Puerto Rico*, IPPR (Psychopedagogical Institute of Puerto Rico), a nonprofit organization that today offers educational, medical, nutritional, and social work services; residential facilities; and recreational activities (Instituto Psicopedagógico de Puerto Rico, 2016). It employs educators, physicians, social workers, psychologists, therapists, care workers, and recreational leaders who offer their services to resident and day students in an environment of love, respect, and warmth.

The Institute (IPPR) started in an old house in San Juan with donations obtained from the community and raised by the group of parents organized by María Elisa Gómez de Tolosa (Torres, 2017). It originally offered only day care services for children with developmental and intellectual disabilities (Instituto Psicopedagógico de Puerto Rico, 2016). It then applied for government state and federal funds and a large contribution from the Kennedy Foundation to construct the institution and by 1969 was able to inaugurate the Center for Evaluation, Diagnosis and Treatment John F. Kennedy and the Center for Education María E. Gómez de Tolosa in a piece of land donated in Bayamón, PR. Rose Kennedy herself inaugurated the new buildings (Pérez Rivera, 2015).

After more than seven decades of its foundation, the Institute (IPPR) continues to offer a safe residential home to around a hundred adults with mental retardation, some of which have lived there for more than 60 years, since they were children; a therapy center that offers numerous daily interventions; a day school for children with intellectual diversity that offers education and training in daily living skills for its students

according to their abilities; and physical education and recreational activities including a basketball team that has been champion several times in the Special Olympics (Torres, 2017).

For María Elisa Gómez de Tolosa, the Institute (IPPR) became her fourth child, especially after the death of Rafaelito in 1955, her son with mental retardation that inspired its foundation. She devoted all her free time to its development and to her functions as president of the board of directors of the institution (1949–1964). She wrote letters to and met with local legislators; made depositions at the local legislature; had private conversations with Luis Muñoz Marín, governor of Puerto Rico from 1948 to 1962; wrote letters to congressmen in the United States; and offered written and verbal support to projects that provided funds to enhance the care and opportunities of development to populations with intellectual diversity (Morales Velázquez, 1967). Between 1963 and 1965, she offered support to House of Representatives Project of Law #3366, of the US Congress, a project that would provide millions of dollars for families with members with functional diversity for their care and rehabilitation, for research in mental retardation, and for the development of state's plans, Puerto Rico included, for services for this population (88th US Congress, 1963).

According to Tatiana Pérez Rivera (2015), “with the foundation in 1949 of the IPPR, Gómez transformed the expectations that people had of persons with intellectual disabilities” (6th paragraph, our translation). The IPPR demonstrated that this population with intellectual disabilities was able to enjoy life, learn some basic academic skills, and overall learn daily living skills and take care of their basic needs (Gómez de Tolosa, 1965, in Morales Velázquez, 1967).

In 1954, María Elisa Gómez de Tolosa was among the founding members of *Asociación de Psicología de Puerto Rico*, APPR (Association of Psychology of Puerto Rico) and was their fourth president from 1957 to 1958. The Convention of 1958, which she organized, was dedicated to mental retardation with a major presentation by Dr. E. Arthur Whitney (1895–1966), president of the American Association of Mental Deficiency

(today, American Association on Intellectual and Developmental Disabilities) who spoke about the present problems of mental retardation (Roca de Torres, 2006). María Elisa Gómez de Tolosa was also an active member of the American Association of Mental Deficiency.

María Elisa Gómez de Tolosa was certain that people with intellectual disabilities needed to be offered services to supply their needs with love and dignity. She ensured herself that those services were offered at the IPPR and at the Office of People with Handicaps she directed at the Health Department. She received many acknowledgments from different social and professional organizations in Puerto Rico, among them two recognitions from Association of Psychology of Puerto Rico in 1972 and 1977; Woman of the Year in 1970; two awards by the Puerto Rican Medical Association in 1973 and by the Academy of Family Physicians in 1974; a letter of recognition by Richard Nixon, president of United States, in 1972; and a *doctorate honoris causa* bestowed by World University.

Puerto Rico is in debt with María Elisa Gómez de Tolosa for her visionary work in the area of education and services for people with intellectual and developmental variabilities. Her family continued her work with this population.

José Antonio Gómez Robleda studied medicine at the Escuela Nacional de Medicina de la Universidad Nacional Autónoma de México (UNAM) (National School of Medicine in the Autonomous Mexican University of Mexico), and received his grade as doctor in 1929 for his investigation: “An Electrophonocardiography Procedure” (Gómez Robleda, 1929), and after that he specialized in psychiatry.

In the 1930s he served at the Psychologic and Anthropologic Service in the Departamento de Psicopedagogía e Higiene (Department for Psychopedagogy and Hygiene) and then passed to the Instituto Nacional de Psicopedagogía (National Institute of Psychopedagogy), both of this work for the Secretaría de Educación Pública (Public Education Secretary) (SEP). Later, he moved to the Instituto de Investigaciones Sociales (Institute of Social Research) (UNAM) (Stern, 2000, p. 86).

From 1930 he was a professor at the UNAM; biology, medicine, and psychology were his assignments. Moreno points out, with no date specificity, that “he was a professor at the Universidad Nacional Autónoma de México (Mexico National Autonomous University), Instituto Politécnico Nacional (National Polytechnic Institute) and the Escuela Normal Superior de Maestros (Superior School for Teachers)” (Moreno, 2017, p. 648).

In his working path, he ran the Departamento de Estudios Médico-Biológicos de la Escuela Nacional de Medicina (Department of Medical-Biological Studies of the National School of

Medicine) in 1934; also this year, he was a secretary for this same school. In 1940, he administrated the Departamento de Investigaciones Científicas (Scientific Research Department) at SEP and performed as secretary for the Technic Educational Committee, also for the SEP.

In 1950, he assumed the direction of the Instituto de Investigaciones Estadísticas (Statistical Research Institute) in the UNAM. He was Subsecretary of Public Education (SEP) in 1952.

In his politic career (1947), he belonged to the Partido Popular (Popular Party), founded by Vicente Lombardo Toledano (1894–1968), “Lombardo tried to organize the party leaning in various political and syndical personalities, that’s why he invited such a different people as Octavio Vejar, Alejandro Gómez, Salvador Novo, José Gómez Robleda. . .” (Estrada, 1949, p. 8). In 1949 he was a federal deputy candidate for the IV district, in Mexico City.

In the 1950s, he was in charge of the Supremo Consejo de la Defensa y Prevención Social (Supreme Council for Defense and Social Prevention) of the Secretaría de Gobernación (Ministry of the Interior), with other doctors. He participated making the 1931 Penal Law with “Francisco González de la Vega, José Ángel Cenicerros, Alfonso Teja Zabre, Raúl Carrancá y Trujillo, Luis Garrido, Emilio Pardo Aspe, Carlos Franco Sodi, José Ortíz Tirado, Francisco Argüelles y Javier Piña y Palacios. . .” (García, 2013, p. 774).

For his dedication he was awarded with the Medalla al Mérito Criminológico (Medal for the Criminologic Merit) “Alfonso Quiroz Cuarón,” in 1984.

He was part of the creation of the doctorate in Facultad Jurídica (Penalistic Sciences) for the Law Faculty at University of Veracruz (Universidad Veracruzana) (1942). He was, as well, professor in the doctorate (Hernández, 1992, p. 292). At the beginning of the 1930 decade, he worked in the “La Castañeda” observation pavilion: “over those experience he came up with the idea for the construction of the Manicomio General. . .” (Rivera, 2010, quoted by Fernández, 2015, p. 215).

As a professor and writer, Gómez Robleda influenced the scientific path of such persons as

Alfonso Quiroz Cuarón (1910–1978), the first Mexican criminologist: in the book *Don Justo* (1946), one might appreciate the influence, especially in the police investigation matters “Don Benjamín teaches Alfonso the [swift] art of investigation, when the master and the pupil accept the task of identifying Don Justo’s smuggler” (Moreno, 2014, p. 413).

Biotypology was an important instrument for him performing as a professional: “biotypology has come to focus from a new point of view: human beings, whichever their race is can be grouped by both psychics and somatic characteristics...” (Gómez et al., 1943, p. 588). The average person, for him, was “the expression of the maximus functional equilibrium of the parts of individual wholesome” (Gómez & D’Aloja, 1947, p. 18).

He worked on different investigations, families and testing IQ in elementary children, with Mexico’s natives. He used the biotypology with tarascos, zapotecas, and otomis, these last being the representative group, classifying them as “lack of imagination, asthma, manic depression and hypersexuality” (Stern, 2000, p. 88). For other investigators, Gómez Robleda’s “breakthrough was his biotypology remarks on rural individual such as the Patzcuaro fishermen” (Salamanca, 2013, p. 21).

One of his greatest interests was criminology, which led him to introduce it to the Procuraduría General de Justicia (Mexico City Attorney General’s Office) and contribute to the implementation of the criminological clinical study in Mexico City.

Gómez Robleda did the first studies on criminals in Mexico as quoted by Moreno (Moreno, 2009, p. 411): “Gómez Robleda, in our country, began the scientific study of the criminal personality.” He worked, as well, with other authors, for example, Quiroz Cuarón in the Ramón Mercader study, the Leon Trotsky assassin, in which they conclude that the murderer has lying skills and his knowledge of communism was shallow and superficial; but with a high “active Oedipus Complex” (Reynoso, 2012, p. 29).

Also, Gómez Robleda and Quiroz carried out the analysis of the mental illness of the murderer

of women Gregorio “Goyo” Cárdenas (1915–1999); “Goyo,” is a well-known murderer in Mexico from 1942 onward.

hygiene

His father, from San Luis Potosí, was the military engineer Gustavo González; his mother was Dinnah Enríquez Lagos, aristocrat and daughter of General Juan de la Luz Enríquez Lara, governor of Veracruz from 1884 to 1892, during the regime of Porfirio Díaz Mori (1876, 1877, 1877–1880, 1884–1911). Despite maternal opulence, the González Enríquez family had a modest

existence due to the Enríquez opposition to the aforementioned marriage.

Raúl started primary school at the Practical School attached to the Normal School founded by his grandfather, where he distinguished himself as the brightest student. Due to the lack of money and social pressure, the family had to leave Xalapa and went to Mexico City, where they stayed in a small apartment. There, Raúl González finished primary school in a government school, joining the Escuela Nacional Preparatoria (National Preparatory School) (ENP) after finishing the secondary school and later, he entered the Escuela Nacional de Medicina (National School of Medicine) of the Universidad Nacional de México (National University of Mexico) (UNM), which he concluded in 1928, and in February of 1929, Raúl González presented the thesis “Contribution to radiological diagnosis of spinal compressions.”

In March of the same year as his degree, Manuel Guevara Oropeza (1899–1980), his countryman and former professor of psychiatry, in the Chair created in 1926, a year after Pierre Janet visited Mexico, took him to work alongside him in the General Asylum of Mexico, popularly known as “La Castañeda”, the place where he remained until his untimely death. There, he was head of the Service Men-Observation. Almost at the same time, Guillermo Dávila García (1903–1968) invited him to render his services in the private psychiatric sanatorium “Rafael Lavista” in the south of the city.

The in-depth knowledge he came to acquire on mental pathology, with a clear and decisive psychoanalyst orientation, soon made his name appear among intellectual, national, and foreign circles. In fact, González Enríquez was one of the pioneers of this discipline in Mexico. By 1934, already as a professor at the Escuela Nacional de Medicina (National School of Medicine), together with Guillermo Dávila García and Alfonso Millán Maldonado (1906–1975), he endowed chairs and lectures on psychoanalysis; in 1937 he managed a seminar on psychoanalytic theory in which the precepts of Sigmund Freud were studied in depth.

In order to understand his tasks, it is important to point out the psychiatric current that González Enríquez practiced. He practiced social psychiatry, a term coined in Holland in the 1920s. He believed that mental health should be carried out from education, in all stages of life, and in preventive measures, rather than in the doctor's office or in asylums. Therefore, his interest in maternal and child hygiene, prenatal control, eugenics, sexuality, prostitution, alcoholism, criminal behavior, and all those biological and social determining factors in the appearance or precipitants of psychopathology. He defined mental hygiene "as a scientific art that, using other disciplines, tries to improve psychic functioning and avoid its imbalance" (Fournier, 1990).

In such a way that, in congruence with the above, in Mexico and Latin America, González Enríquez was the forerunner of adolescent sexual health in the 1930s. By 1932, he submitted to the Academia Nacional de Medicina (National Academy of Medicine) competition a "Program for Sex Education in the Mexican High School," which was one of his first great works.

Between 1931 and 1933, he worked as a psychiatrist "attached to the Dirección de Previsión Social (Social Security Directorate), in charge of carrying out various studies among inmates of the Cárcel de Belem (Belem Prison) and the Penitenciaría del Distrito Federal (Federal District Penitentiary)" (Pasquel, 1968, p. XXXIV). In 1933, he was especially commissioned to the Islas Marías, a federal penal colony located in the Pacific Ocean, to carry out comprehensive studies on the mental health of prisoners, particularly criminological, and it is the place where he went to live with his wife and Yólotl, his first daughter, when she was not even 1 year old. The result of all these efforts was his work "El problema sexual del hombre en la penitenciaría" ["The sexual problem of men in the penitentiary"] (1934), where he makes an analysis and provides for the first time, not only in Mexico but in Latin America and many other countries, innovative and paradigmatic programs for the prisoners from an advanced mental health projection. He also planned the creation of a psychiatric annex

on the Isla Madre, as well as agricultural works, workshops, and small industries.

From then on he appeared as an eminent criminalist and became a member of the *Academia Mexicana de Ciencias Penales, A. C.* (Mexican Academy of Criminal Sciences, A.C.), where he entered with the work entitled "Norma y Tránsito" (Norm and Transgression) in 1949, probably his masterpiece in this field and which attracted international attention.

When the Instituto Mexicano del Seguro Social Mexican (Institute of Social Security) (IMSS) was created, in 1944 González Enríquez organized his first Psychiatric Service, although his intention was to create a Instituto Neuropsiquiátrico (Neuro-psychiatric Institute), initially attached to the Clinic # 11, and then it was located on Naranjo Street in the neighborhood of Santa María la Ribera. The creation of this institutional pillar of mental health care was a benchmark in countries such as Venezuela, Colombia, Ecuador, Peru, and all of Central America.

González Enríquez participated in various societies. He was a founding member, in 1937, of the Sociedad Mexicana de Neurología y Psiquiatría (Mexican Society of Neurology and Psychiatry); secretary of technical affairs of the Liga Mexicana de Higiene Mental (Mexican League for Mental Hygiene), created in 1938, and of the World Federation for Mental Health (of which he was vice president in the IV Congress of 1951); founding member of the World Psychiatric Association, in 1950; president of the *Sociedad Mexicana de Psicología* (Mexican Society of Psychology), organized in 1950; and founding president of the *Asociación Psiquiátrica de América Latina* (Psychiatric Association of Latin America), 1950–1952, among others, both in Mexico and abroad (Anónimo, 1951; Campos Farfán, 2017).

He attended countless national and international conferences, presenting innovative works in each of them.

On May 19, 1947, he entered the Academia Nacional de Medicina (National Academy of Medicine) where he offered the work "Introducción al estudio de la medicina social" ("Introduction to the study of social medicine"),

which was praised by Alfonso Pruneda García (1879–1957), former rector of the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM, since 1945, previously UNM). At the Academy he became president of the Social Medicine section.

In the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) of the UNM, in its Psychology Section, in 1943 he was in charge of the subject of Evolutionary Psychology. Upon becoming a Department in 1945, he participated in the Master's degree curriculum, teaching Rational Psychology in the 3rd and 4th semesters. By 1948 he was a Social Psychology mentor in the same grade. In 1949 he took office as head of the Department and, consequently, he became representative (1949–1952) of the Faculty before the Consejo Universitario (University Council). González Enríquez reformed the curriculum, giving a new turn to the educational establishment located in the "Casa de los Mascarones," in Ribera de San Cosme # 71, in Mexico City.

In the Facultad de Medicina (Faculty of Medicine) of the UNAM, he was in charge of the third course of Medical Clinic and Neuropsychiatry, becoming famous for the criticisms of traditionally applied teaching procedures. He also gave classes at the Escuela de Trabajo Social (School of Social Work), of which he was a founder, and the Escuela Superior de Medicina Rural, Salubridad e Higiene (Higher School of Rural Medicine, Health and Hygiene), the Instituto Politécnico Nacional (National Polytechnic Institute) (IPN), and at the Escuela Nacional de Antropología e Historia (National School of Anthropology and History) (ENAH) teaching the chair of Psychodynamics of Cultures, since 1950.

Since the 1930s, he's already news in the Caribbean and Central American countries, and particularly famous in Cuba, Guatemala, and Honduras. In the 1940s and 1950s, he was mentioned, quoted, or written with some frequency in the main Iberoamerican printed media: Spain, Mexico, and all of South America. In 1950, he was a member of the editorial board of the journal of *Estudios Psicosomáticos* (Psychosomatic Studies) of Peru. Furthermore, he traveled the entire

American continent giving conferences and giving interviews to the press.

He had a fairly extensive and high-quality written work; apart from strictly academic works, he published stories, poems, speeches, novels, and translations. It is speculated that through his works he tried to characterize the Mexican psychology under the psychoanalytic technique. In 1936 a short story book was published, and in 1942 it won the annual "Miguel Lanz Duret" award that was granted by the newspaper *El Universal* with the novel: San Antonio, S. A.

Between 1948 and 1950, he organized the first formal Specialization Course in Psychiatry in the Men-Observation Pavilion in "La Castañeda." Professors were Guillermo Dávila (Psychopathology), José Luis Patiño and Abraham Fortes Rudoy (Psychiatric Clinic), Efrén Carlos del Pozo Rangel (Neurophysiology), Dionisio Nieto Gómez from Madrid (Neuropathology), Federico Pascual del Roncal from Aragón (Psychological Tests), as well as two anthropologists: Arturo Monzón Estrada and the Catalan Claudi Esteva i Fabregat (Social Anthropology). For the year of 1948, in one of his texts, he states that he is a professor of neuropsychiatry at the UNAM.

Something that should not be overlooked was his relationship with Erich S. Fromm. At the end of the 1940s, specifically in 1949, the German arrived in Mexico. It is said that the noxious climate of New York, where he lived, was not favorable to the health of his second wife, the Jewish photographer Henny Gurland (1900–1952); therefore, following medical indications, they settled down in a more benign place and ended up in San José Purúa, Jungapeo municipality, in the State of Michoacán, where its thermal waters enjoyed medicinal fame. González Enríquez traveled to Michoacán to invite Fromm to join his Psychiatry Course and asked him to support some classes. Fromm agreed to teach a Seminar on Dynamics of the Unconscious.

Once this was concluded, he also invited him to stay in Mexico, and the *Grupo mexicano de estudios psicoanalíticos* (Mexican Group for Psychoanalytic Studies) was organized, self-appointed as the "original group," comprised of

13 aspiring physicians: Raúl González Enríquez, Aniceto Aramoni, Guillermo Dávila, Jorge Derbez, Abraham Fortes, Ramón de la Fuente Muñiz, José F. Díaz y Díaz, Francisco Garza, Arturo Higareda, Armando Hinojosa, Alfonso Millán, Jorge Silva García, and Jorge Manuel Velasco Alzaga. González Enríquez was not only his main and favorite disciple but one of the first analyzed. This group lasted until 1956.

In 1951, the Escuela de Graduados (Graduate School) of the UNAM formally opened the University Course of Psychiatry, which until then had been theoretical-tutulary in the Manicomio General (General Asylum), of which González Enríquez was the first mentor (only for the academic years from 1951 to 1952). He was succeeded by Guillermo Dávila and later by the teacher Ramón de la Fuente Muñiz.

During the work of the First World Congress of Psychiatry, which took place in Paris in September 1950, the *Asociación Psiquiátrica de América* (Psychiatric Association of Latin America) (APAL) was created on its own motion. In December 1951 this association organized its First Congress in the cities of Mexico-Xalapa. In this congress, González Enríquez supported the creation of the now *Asociación Centroamericana y del Caribe de Psiquiatría* (Central American and Caribbean Association of Psychiatry) (ACCP), represented by the Honduran Ramón Alcerro-Castro (1918–2019). During that first Congress, he also created the Latin American Group for Transcultural Studies (GLADET).

By the end of 1952, with Dr. Isabel T. Kelly (1906–1984), and under a program sponsored by the United States, González Enríquez organized a Specialization course in psychiatry for nurses, pioneer of its kind in Latin America. After this, he devised a solace excursion to the shores of the Gulf of Mexico and visited the archaeological ruins of El Tajín. On Saturday October 18, in a special truck, they arrived in Tecolutla, Veracruz. The group consisted of 7 physicians and 13 nurses. At night, he entertained his guests with a boat ride on the river; a doctor and five nurses accompanied him. They never returned from the trip, probably dead by drowning, in

addition to González Enríquez, Dante Róquez from the Dominican Republic, and the nurses Irma del Carmen Glinz from Mexico, Hilda María Gavilanes and Ermila Jáuregui Moncayo from Ecuador, and Francisca Morales, Salvadoran, and Miriam Chinchilla from Costa Rica. Their bodies were never found.

González Martin, Diego

Born *Canary Islands, Spain, July 30, 1913*

Died *Havana, Cuba, September 19, 1998*

Diego González Serra
University of Havana, Havana, Cuba

Keywords

Cuba · Psychophysiology · Historical-cultural approach · Pavlovian research

At 5 years of age, Diego emigrated with his family to Cuba. There, he assisted in basic studies and high school. In 1933, he entered a medicine school, but had to abandon it later for economic reasons, and some years later, he returned and became a Doctor in Medicine in November of 1951. He had to leave the country for political reasons and traveled to France, where he attended courses at the Sorbonne University. In 1953, he received an invitation and traveled to Bucharest, Romania, and under the direction of the professor Kreindler (1900–1988) received a course on “Theory and Pavlovian Experimentation.” In December of 1957, he returned to France, where he carried out special studies of Neuro Psychiatry at the Institute of Medicine of the University of Paris. He returned to Cuba in 1959, at the beginning of the revolutionary process. Later, between 1966 and 1967, he visited Georgia, in the Union of Soviet Socialist Republics (USSR), where he attended a course of Electrophysiological Investigation under the direction of the professor Alexander Roitbak (1919–1991) at the Institute of Physiology of Tbilisi.

González Martin’s work extended to the fields of neurophysiology, psychiatry, and psychology. He worked as a medical psychiatrist and as a psychiatry professor at the Universidad de la Habana (University of Havana) in Cuba and the Universidad de Merida (University of Merida) in Venezuela. He was Vice Director of the Instituto de Investigaciones Fundamentales del Cerebro de la Academia de Ciencias de Cuba (Institute of

Fundamental Investigations of the Brain of the Academy of Sciences of Cuba) and founder in 1962 of the Escuela de Psicología (School of Psychology) at the University of Havana, later transformed into the Facultad de Psicología (Faculty of Psychology). There he taught Neurophysiology for 25 years and he wrote and published several books (Cairo, 1984; Oliva 2005).

Among them, he published in 1960 the book entitled *Experimentos e Ideología. Bases de una Teoría Psicológica (Experiments and Ideology. Basis of a Psychological Theory)* that constitutes the first book in Cuba that exposes the basis of the historical cultural approach in psychology, with an original perspective. In the first part of this book, he carried out a critic of the experimental schools in psychology: the physiologists of the sensations, Helmholtz (1821–1894) and Muller (1801–1858); the introspectionists, Wundt (1832–1920) and Titchener (1867–1927); the school of Gestalt; and the behaviorism, and in the second and third parts of the book he undertook his personal elaboration of a basic theory in psychology and psychiatry (González, 1960).

He concluded that the mind shows a cluster of four basic dimensions: (1) the organic unit (the psychological phenomenon should be considered in function of the whole organism where it takes place); (2) the subjective – objective unit of the psyche (the psychic fact is subjective for what the person feels or it is experienced internally by him, but it is objective because it has a material substratum: the cerebral activity); (3) the individual-environment unit (the individual’s interaction with his social environment); and (4) individual – history unit (the historical changes of the social conscience reflected in the individual conscience).

González Martin was the main utterer in Cuba of the work of Ivan Pavlov (1849–1936) and Pyotr Anokhin (1898–1974) and applied both of their ideas in his work like psychiatrist and in scientific researches presented in international events. In 1966, he began the research of the limbic system and in particular, of the cerebral amygdala. Starting from 1970, he began a research of learning by passive observation and of the external and

internal systems of cognition in the Institute of Fundamental Investigations of the Brain, which was exposed in his book *Cerebro Cognoscente: un modelo para su estudio* (Cognitive Brain: a research model), where his great interest by the theory of systems and its adhesion to this approach are evidenced (González, 1975).

This research activity had international repercussions. In 1966, it was the object of a reference – in the form of a paper with his signature – in the special edition of the journal *Nauka Chelovistchesvo* (edited by the administration of the Soviet Union), dedicated to the commemoration of the 50th Anniversary of the Revolution of October that was only granted to scientists of international merits. He was a member of the International Brain Research Organization (IBRO) and of other international scientific societies. In 1982, in Moscow, as a recognition to his scientific work in neurophysiology, the Ministry of Public Health of the Soviet Union and the Institute Sechenov granted him the Medal “Sechenov.” On February 24, 1984, he received the Doctor’s scientific degree in Psychological Sciences in the Republic of Cuba.

His contribution to Cuban Psychology consists in his theoretical, academic, experimental, and professional work. He was one of the first who initiated the Marxist and historical cultural approaches in psychiatry, neurophysiology, and psychology.

Fernando González Rey was a Cuban psychologist, scholar, and educator, whose legacy contributes to a new, complex, and influential theorization of subjectivity from a cultural-historical perspective. His academic legacy comprises 29 books, 10 edited or coedited books, 90 book chapters, and 132 scientific articles published in 5 languages: Spanish, Portuguese, English, Russian, and French. His work is characterized by its creativity, breadth, and depth. It contributes mainly to the fields of cultural-historical psychology, critical psychology, psychological research, education, psychotherapy, human health, and social psychology.

González Rey was born in Havana, Cuba, in 1949. His lower-middle-class family was constituted, both from his mother's and father's sides, by Spanish immigrants. An only child, he was the first member of the family to become an academic (Goulart et al., 2020).

In his youth, González Rey was integrated, like the majority of his generation, into the Cuban revolutionary process, actively participating in several tasks. During his students years in Psychology at the University of Havana, he was part of the Communist Youth and of the University Student Federation. After that, he entered the ranks of the Communist Party of Cuba. During his militancy in these political organizations, he was characterized by the capacity to reflect critically on what he considered to be dogmatic and bureaucratic (Goulart et al., 2020). Indeed, he maintained this critical capacity throughout his career as a researcher and a teacher.

González Rey carried out his PhD in Psychology (1977–1979) at the Moscow Institute of General and Pedagogical Psychology. Later, he concluded a degree of Doctor in Sciences (1987) at the Institute of Psychology of the USSR Academy of Sciences. Importantly, González Rey was, and still is, the only Latin American to obtain this science degree (Goulart et al., 2020).

In Cuba, from late 1970s until mid-1990s, González Rey contributed significantly with teaching and research the topic of personality from a cultural-historical perspective, which generated a new interest in this topic in Cuban psychology. He also advanced the articulation between personality and communication, highlighting the active role of the subject, and the contradictory character of human development, mainly through his research projects in education and human health. In the 1980s, González Rey published dozens of scientific articles in the *Revista Cubana de Psicología*, as well as published different books edited in Cuba (e.g., González Rey, 1983a, 1983b, 1985).

González Rey was president of the *Sociedad Cubana de Psicología* (Cuban Psychology Society) (1986–1995), dean of the Facultad de Psicología (Faculty of Psychology) at the

Universidad de la Habana (University of Havana) (1985–1990) and vice rector of *Universidad de la Habana* (1990–1995), which sometimes caused friction with higher levels of institutional management. As explained elsewhere:

In 2000, as a result of political tensions with more orthodox wings of the Ministry of Higher Education and the Communist Party, González Rey and Albertina Mitjás Martínez, his academic and life partner, were not allowed to return to Cuba, after working in Brazil as visiting professors from 1995 to 1999. This would mark the beginning of a new chapter in his life and in his career. (Goulart et al., 2020, p. 12)

In Brazil, González Rey worked in different universities, such as *Universidade de Brasília*, *Pontifícia Universidade Católica de Goiás*, *Pontifícia Universidade Católica de Campinas*, and *Universidade Federal do Ceará*. From 2000 until his passing, he chose *Centro Universitário de Brasília* as his main workplace. Throughout his academic career, González Rey was Visiting Professor in several institutions in different parts of the world, such as the *The London School of Economy* (London, UK, 1995), *École des Hautes Études en Sciences Sociales* (Paris, France, 1995, 2004), *Monash University* (Melbourne, Australia, 2013), *City University of New York* (New York, USA, 1993), *Universidad Autónoma de Madrid* (Madrid, Spain, 1996, 2006–2007), *Universidad Autónoma de México* (Mexico City, Mexico, 1991–1994, 2000–2003), *Universidad Central de Venezuela* (Caracas, Venezuela, 1982, 1987, 1990, 1993, 1999), *Universidad San Carlos de Guatemala* (Ciudad de Guatemala, Guatemala, 2004–2006), *Universidad de Buenos Aires* (Buenos Aires, Argentina, 2003), *Universidad de Puerto Rico* (Puerto Rico, 1988, 1999, 2012), and *Universidade de São Paulo* (Ribeirão Preto, Brazil, 2010).

González Rey was especially influenced by Lev Semionovitch Vygotsky (1896–1934), Sergei Leonidovich Rubinstein (1889–1960), Lidiia Il'inichna Bozhovich (1908–1981), and Vil Emanuilovich Chudnovski (1924–2016) in terms of his theoretical focus on personality from a cultural-historical perspective. His PhD thesis was supervised by Chudnovski in the laboratory

led by Bozhovich at the Moscow Institute of General and Pedagogical Psychology. Gradually, González Rey started to advance the concept of communication and to criticize the limits of the dominant concept of activity in Soviet psychology (González Rey, 1983a, 1983b, 1985). The link between communication and personality was developed in his thesis for the degree of Doctor in Sciences in 1987 in the Institute of Psychology at the Academy of Sciences of the Soviet Union, whose director was Boris Fedorovich Lomov (1927–1989). The concept of communication was also an important bridge between his work on personality and social psychology, which was developed in this Institute by then, following the integration of two traditions: (1) the research project led by Rubinstein, whose main disciples and colleagues were Ksenia Alexandrovna Abulkhanova (born in 1932), Lyudmila Ivanovna Antsyferova (1924–2013), and Andrey Vladimirovich Bruschkinsky (1933–2002) and (2) the research project developed by Boris Gerasimovich Ananiev (1907–1972) and Vladimir Nikolaevich Myasishchev (1893–1973) in Leningrad (Lomov was a disciple of Ananiev).

González Rey's orientation toward social psychology, which began in Moscow, continued its development as a result of his active participation in the Critical Social Psychology Movement in Latin America from the mid-1980s. He began to highlight the importance of the concepts of subject, personality, and social subjectivity for social psychology (Goulart, 2019). González Rey worked collectively on Latin American social and political psychology alongside other well-known Latin American authors, such as Ignacio Martín-Baró, Silvia Lane Maritza Montero, José Miguel Salazar, and Bernardo Jiménez. This group claimed the importance of advancing a critical social psychology that takes issues specific to Latin America seriously, instead of the traditional mimetic reproduction of North American and European models that characterized psychology in the continent. In 1991, the recognition of González Rey's significant contribution led to his award of the Interamerican Psychology Prize of the Interamerican Society of Psychology.

With his book *Epistemología Cualitativa y Subjetividad* [Qualitative Epistemology and Subjectivity] (González Rey, 1997), González Rey started a new moment in his work by emphasizing the consequences of his previous works for the development of a theory of subjectivity within a cultural-historical approach. This study of subjectivity implied a new set of research lines and publications in which the unity between theory, epistemology, and methodology became central (González Rey, 2019a). His research fields expanded, as well as his dialogue with other theoretical perspectives, such as social representations theory, psychoanalysis, and social constructionism (González Rey, 2017b).

González Rey started to discuss the topic of subjectivity on the basis of a new ontological definition that represents it as a symbolic-emotional system (González Rey, 2014, 2016, 2019b). The symbolic-emotional unity, represented by the concept of subjective sense, transcends the traditional intrapsychic and individual reductionism that has characterized the use of the concept "subjectivity" in psychology and other social sciences (González Rey, 2017b). At the same time, this unity overcomes the social reductionism that has prevailed within cultural-historical psychology, which has historically associated psychological processes with reflections or internalized social operations. His definition of subjectivity emphasizes the idea that individual and social spheres can be integrated as "realities" that share a subjective character, in a contradictory way, without one being reduced to the other (González Rey, 2016).

From this point of view, subjectivity has a culturally, socially, and historically located genesis. However, it represents a generative system, rather than an epiphenomenon of other dimensions. This aspect allows the emergence of individuals, groups, and institutions as subjects of human practices (González Rey, 2019b). The concept of subject is defined as a proper path of subjectivation that implies the generation of alternatives to certain normative social spaces, exerting creative options in a life path (González Rey, 2017b). In this sense, this concept does not imply individualism and the assumption of

rational control, but the permanent capacity for unpredictable options, rupture and creative action. González Rey's theory of subjectivity is a critical theoretical framework in relation to dominant psychology, because it opens a new avenue to explain singular individual and social human creations as inseparable from broader social dynamics.

In Latin America, González Rey gradually became the leader of different research groups elaborating and advancing his theory of subjectivity and a close collaborator with dozens of others in different countries. His effort to consolidate a research team with multiple research lines and frequent joint activities has contributed to the training of dozens of PhDs, who gradually started to occupy important academic positions in Latin America, as well as in other continents (Goulart, 2019).

González Rey's work is an expression of the potential of Latin American psychology in creating new approaches to contemporary topics and theoretical challenges, contributing to the global debate. This is in line with his call for an authorial positioning in face of the frequent mimetic reproduction of northern science by Latin America.

Paraguay · Education · Psychology and teaching · Paidology

María Felicidad González was born in Paraguarí but moved together with her family to Asunción in 1887. She studied teaching at the Escuela Normal de Maestras (Normal School for Female Teachers), where she obtained the degree of normal teacher in 1905. Later, she realized pedagogical studies at the Escuela Normal del Paraná (Normal School of Paraná), through a scholarship granted by the Ministry of Justice, Worship and Public Instruction. After her return, in 1908, she was appointed Director of the Escuela Graduada de Encarnación (Graduate School of Encarnación).

She held the following positions: Deputy Director of the Escuela Normal No. 1 (Normal

School Number 1) (1908–1920); Director of the Escuela Normal del Paraguay (Normal School of Paraguay) (1921–1932) and Inspector of Normal Schools (1943). She was Vice President of the Consejo Nacional de Educación (National Council of Education) and also was a member of a commission for the reform of the elementary education curricula in 1952. In 1959, she was decorated with the Medal of Honor for Educational Merit by the Paraguayan government.

She was a professor of Child Psychology, Pedagogy, Paidology, History of Education, and Philosophy of Education, all of them required courses for normal teachers in Paraguay.

As the Chair of the Escuela Normal del Paraguay, she created the magazine *El hogar normalista* (The normalist home), in which she published articles with ideas that she would later develop in depth in her main works: *Misceláneas Paidológicas para padres y educadores* (Paidological Miscellaneous for parents and educators) (1942) and *Organización escolar* (School organization) (1945). Before the publication of her book on paidology, very little was said about this scientific discipline in Paraguay, and the issuing of the book contributed significantly to its dissemination. Through the approaches carried out in the book, an influence of the psychological ideas derived of the active school is clearly perceived, which was also very important for the knowledge of these issues in Paraguay (García, 2006, 2014). Likewise, she was the creator of the Kindergarten and the psychology laboratory of the Normal School.

María Felicidad González was also a member of the Paraguayan feminist movement in its origins. She participated in the Pan-American Conference of Women held in Baltimore, United States, in 1922, and in 1923, she published an article on Paraguayan women's movements in the magazine *Feminismo Internacional* (International Feminism) of the Liga Internacional de Mujeres Ibéricas e Hispanoamericanas (International League of Iberian and Hispanic-American Women). In 1929, she organized the Asociación Femenina del Paraguay (Paraguayan Women's Association), to support the bill for equal civil rights presented by Congressman

Antonio R. Sosa, project that did not prosper. Over the years, she would be the representative in Paraguay of the International League of Iberian and Hispanic American Women. In 1933, she participated in the Séptima Conferencia Panamericana (Seventh Pan American Conference, in Montevideo), on behalf of Paraguay.

He recognized the influence that the Paraguayan sisters and educators Adela Speratti (1865–1962) and Celsa Speratti (1868–1938), Leopoldo Herrera (1863–1937) and Johann Pestalozzi (1746–1827) had on his educational ideas, of a positivist and hygienist nature. As Director of the Normal School, she directed educational experiments based on escolanovism within the framework of the educational reform initiated in 1925 by the teacher Ramón Indalecio Cardozo (1876–1943), Director General of Schools. These experiments consisted of the application of the Dalton Plan and the Winnetka Method.

Maria Felicidad died in Asunción on October 17, 1980.

Costa Rica · Counseling · Psychology

Edgar González-Campos was born on September 15, 1920, in Costa Rica, in the midst of a peasant family in San Pablo de Heredia, where he lived his childhood and did his elementary school at the Escuela Joaquín Lizano (Joaquín Lizano School) in the city of Heredia. He continued his studies at the Colegio Seminario (Seminario High School) with a partial scholarship. This school was directed by the Vincentian Fathers, of German origin, when it was located in San José, on the block right behind the cathedral. After finishing high school, he decided to enter the Catholic Seminary, where he undertook a pair of years of formation toward the priesthood. Nonetheless, he came later to the conviction that he had no vocation for priestly life, although he always showed a great social commitment in his professional practice.

After a time of indecisiveness, he was hired at the Universidad de Costa Rica (UCR) as a secretary to Dr. Enrique Macaya (1905–1982), a well-known academician, who helped him follow the program in Philosophy and Literature, until he got a Licentiate's degree in 1948. Once he graduated, he did graduate studies with a scholarship at the Universidad de Río Piedras (University of Río Piedras), in Puerto Rico. There he had the privilege of being a pupil of the famed Spanish poet Juan Ramón Jiménez (1881–1958), a fact that reaffirmed his great lifelong interest in literature. Back in Costa Rica, Don Edgar worked as a Spanish professor, before specializing in the fields of Counseling and Psychology (Rodríguez, 2001).

Starting in 1950, he entered the Departamento de Orientación del Ministerio de Educación

Pública (Counseling Department at the Ministry of Public Education) (Ureña-Salazar & Robles-Murillo, 2015). Ana Navarro-Riera, in her Licentiate thesis about the origin of the counseling services in the educational area in Costa Rica, and referring to Edgar González, states that “his performance facilitated the consolidation of the Counseling Department at the Ministry of Public Education” (Navarro-Riera, 1976, p. 78). During this period, he is also acknowledged as the author of a pamphlet for teachers about the issue of cumulative record and other counseling techniques (Baldares-Carazo, 2014). All this contributed to the Government’s decision to grant him a scholarship for studying Counseling in the United States, which, in time, would turn him into the first Costa Rican graduate in this discipline.

During his stay in the United States, he entered the graduate program at the University of Wisconsin, where he obtained a master’s degree in Counseling in 1953. Years later, Edgar González returned to this same university in Madison, Wisconsin, to join the Ph.D. program in Educational Psychology, until his graduation in 1964. A fact that gave him much pride was to have been a student of the renowned humanistic psychologist Carl Rogers (1902–1987), who, between 1957 and 1963, lectured in Psychology at the University of Wisconsin.

Within the Costa Rican context, it is a well-known fact that the professional foundations of the discipline of Counseling started with the university education that the first two Costa Rican counselors, Edgar González and Margarita Dobles (1915–2010), received in the United States. They played a relevant role in advising those professors and graduate students at the Escuela de Servicio Social [Social Services School], in the University of Costa Rica, who became the pioneers in high school counseling. In this field, they started to implement group and individual counseling techniques, beginning at Liceo José Joaquín Vargas Calvo (José Joaquín Vargas Calvo High School), Liceo Rodrigo Facio (Rodrigo Facio High School), and Liceo del Sur (Southern High School).

On the other hand, when Dr. Edgar Gonzalez returned to the University of Costa Rica after getting his master’s degree, he worked for four decades at the Departamento de Bienestar y Orientación (Welfare and Counseling Department), today known as the Oficina de Bienestar y Salud (Welfare and Health Office), which he led from 1965 to 1990. This Office had been founded, back in 1950, by Professor Mariano Coronado (1895–1970), a pedagogue in the field of Mental Health who had also studied in the United States.

A School of Psychology did not exist yet by the mid-1960s at the University of Costa Rica (UCR), even though Dr. Edgar Gonzalez and Dr. Margarita Dobles offered Psychology courses at the recently founded Escuela de Educación (School of Education) at the UCR and at the Escuela Normal (Teacher’s Training College) in Heredia (Adis-Castro, 1991). Afterwards, they continued collaborating as teachers at the Escuela de Orientación y Educación Especial de la Facultad de Educación de la UCR (School of Counseling and Special Education of the Faculty of Education at the UCR). Thus, they both contributed their valuable support to the university training process of hundreds of male and female high school counselors in the programs of Bachillerato y Licenciatura en Orientación (Bachelor and University Degree in Counseling).

Meanwhile, the Escuela de Psicología (School of Psychology) began to get organized, starting in 1966, at the incipient Departamento de Psicología (Department of Psychology), that was part of the Escuela de Ciencias del Hombre (School of Human Sciences). Dr. Edgar Gonzalez served there as a teacher of the Psychology of Personality and Motivation Psychology courses, in the Programa de Bachillerato en Psicología (Bachelor’s program in Psychology). Likewise, in 1968, he became a tenured professor at the University of Costa Rica, holding teaching roles at the School of Psychology and the Faculty of Education.

Edgar Guido González, son of Dr. González, through a personal communication contributed to this account by confirming certain facts about his father’s life. He particularly remembered that, as

an expression of Edgar's sincere desire to do social extension work to benefit disadvantaged populations, he collaborated during the 1970s with the Hogar Transitorio No. 1 "Rositer Carballo" ("Rositer Carballo" Transitory Home Number 1), in San José, that operated under the Ministerio de Trabajo y Bienestar Social (Ministry of Labor and Social Welfare). There he attended abandoned children with the purpose of reinserting them in society (de Mézerville, 2019). Thus, he served at the time as the only psychologist in that institution, on Saturday mornings, psychologically advising the social workers and the childcare staff.

Moreover, an outstanding work of Dr. Edgar González in the field of academic publications was his book *Psicología del Adolescente y Aprendizaje* (Psychology of the Adolescent and Learning), published in 1979 by the Editorial de la Universidad Estatal a Distancia (EUNED) [State Distance University Press]. In the preface, Víctor J. Flury, the academic publisher, expressed that this book fulfilled a twofold objective: "It informs, to the extent that it has to inform, and promotes an attitude of serious understanding in teachers and students" (González-Campos, 1979a, p. 6).

Another remarkable event in the life of Dr. Edgar González is that in 1979 Editorial Costa Rica, the most prestigious publishing house in the country, published his biographic story book titled *Mamita Garita: Cuentos* (Grandma Garita: Stories), the nickname with which his grandmother, Margarita Campos, had been known. The prologue to this book was written by the renowned Costa Rican author Isaac Felipe Azofeifa (1909–1997). Edgar's childhood and youth experiences are narrated in the book, in the context of the rural traditions of the first half of the twentieth century. Subsequently, he also tells about his hard process of integration into the urban world, which he successfully coped with as a student coming from the countryside to the capital city (González-Campos, 1979b).

Dr. Edgar González Campos passed away on September 11, 2001, in San José, on that tragic day which coincided in the world scene with the destruction of the Twin Towers of New York. As

opposite to this massive destruction, Edgar Gonzalez was a man who spent all his life building in many important fields. He thus deserves a just recognition for the meaningful influence he left in so many people, as well as in the Costa Rican institutional system.

González-Moreyra, Raúl

Born *Lima, (Peru), 29 October 1934*

Died *Lima, (Peru), 22 November 2002*

Tomás Caycho-Rodríguez

Universidad Privada del Norte, Lima, Peru

Keywords

Peru · Psycholinguistics · Psychology of learning

Raúl González-Moreyra entered the Universidad Nacional Mayor de San Marcos (National University of San Marcos, UNMSM, Lima) in 1952. He began his university studies in Law and then moved to the newly created section of psychology and studied in parallel the undergraduate program in education. In 1964 he graduated with a B.A. and in 1965 he received the professional title of psychologist. Always in UNMSM in 1987 he obtained the Ph.D. (psychology, 1987).

He began his career teaching at his *alma mater*, to later teach at the Universidad Nacional Agraria de La Molina (National Agrarian University of La Molina), Universidad Peruana Cayetano Heredia (Cayetano Heredia Peruvian University), Pontificia Universidad Católica del Perú (Pontifical Catholic University of Peru), Universidad Nacional Federico Villarreal (National University Federico Villarreal), Universidad de Lima (University of Lima), Centro Peruano de Audición y Lenguaje (Peruvian Hearing and Language Center, CEPAL), and Universidad Femenina del Sagrado Corazón (Feminine University of the Sacred Heart), all in Lima. In all these universities, he taught courses such as general psychology, educational psychology, psychology of learning, thought and language, psycholinguistics, among others.

Along with his teaching work, he also served in the 1970s as academic director of the Instituto Nacional de Investigación y Desarrollo de la Educación (Institute for the Development of

Education, INIDE), advisor to the Education Reform Commission in the areas of teacher training and higher education. At UNMSM he was for years head of the Experimental Psychology Laboratory, head of the General Psychology Section, and director of the Instituto de Investigación Psicológica (Institute for Psychological Research; Velarde & Canales, 2006).

His contributions to psychology were focused on psycholinguistics, educational psychology, dissemination and conceptualization of psychology, as well as the epistemological and theoretical contributions of psychology (González-Moreyra, 2001; MacGregor et al., 1989). Based on these research topics, he published his most important book *Psicología del aprendizaje* (Psychology of learning, González-Moreyra, 1972), which has several reissues. Other publications of his have dealt with the formation of concepts in bilingual children, the evolution and psycholinguistic structure of the poetic function of language (González-Moreyra, 1988), the psycholinguistic and psychometric foundations of a short test of Quechua-Spanish bilingualism (a topic very little explored by the psychologists; González-Moreyra & Quesada, 1985), and the psycholinguistic development of verbal associations (González-Moreyra, 1984).

Apart from his recognized competence in the fields of learning psychology and psycholinguistics, González influenced Peruvian psychology by promoting an objective and, if possible, experimental approach of psychological phenomena.

Argentina · Child psychoanalysis · Surgical psychoprophylaxis · Argentine Psychoanalytic Association · Pioneer

Elizabeth Garma was the daughter of Alfred Goode, English engineer, advisor to the English company *Hufnard Gautier*, and of Anita Rasmussen, Argentinean of Danish descent. She was born and lived in Uruguay until she was 3 years old, when her family moved to England again. She remained there until her puberty, settling then in Argentina.

The entry of Elizabeth Garma, usually known as Betty Garma, into the field of psychoanalysis differentiated her from the rest of the pioneers of the *Asociación Psicoanalítica Argentina* (Argentine Psychoanalytic Association, APA). In her case, her work as English teacher gave her access to the

incipient universe of children psychoanalysis in Argentina. Among her English students were Nora Rascovsky and Carlos Mario Aslan (1930–2009). It was they who stimulated her to begin her psychoanalytic formation and start her own analysis. Marie Langer (1910–1987) was her analyst from the year 1942.

In 1944, she started to work in the correction of the translation done by Arminda Aberastury (1910–1972) of Melanie Klein's book (1882–1960) *The psychoanalysis of children* [Klein, 1948]. In this period, she met who would later be her husband, Ángel Garma (1904–1993), one of the founders of the APA. She met him when he called her to translate some papers to present in New York.

Ángel Garma, Arminda Aberastury, and Marie Langer were the ones who advised her to start analyzing children instead of giving them English lessons. In 1945, she began to do research with Arminda Aberastury about the early development of children psychoanalysis. In 1947, she started to analyze children (Bloj & Vera, 2017).

Betty Garma had an important artistic vocation. She sang and acted in different radios and theaters of the city. Toward the end of the 1930s, she conducted a program in *Radio Excelsior* and sang in radio *El mundo* and in *Radio Nacional*.

In the middle of 1949, together with Ángel Garma, Teodoro Schlossberg, Arnaldo Rascovsky (1907–1995), and Matilde Wencemblat de Rascovsky she attended the *XVI International Psychoanalytic Congress*, the first carried out after the Second World War. There she personally met Anna Freud (1895–1982), Melanie Klein, and other outstanding members of the Kleinian Group, such as Paula Heimann (1899–1982), Betty Joseph (1917–2013), and Hanna Segal (1918–2011).

In 1953, she traveled to Europe with Ángel Garma for three months. She presented in London a paper referring to the analysis of a child with oral problems. In Rome, she gave a lecture about technical aspects of child analysis. During the same trip, after Melanie Klein learned that Betty Garma had analyzed a 21-month-old-child, Klein invited her to spend a season in London to work with her and her group. Betty

Garma accepted and in 1955 went back to London. She stayed there for a month and a half, holding daily meetings with Klein (Bloj & Vera, 2017).

In 1962, Arminda Aberastury published *Teoría y técnica del psicoanálisis de niños (Theory and technique of children psychoanalysis)*. This book gathers the experience of many children analysts who worked in APA, highlighting the transmission of the clinical aspects of the work with children that was under development. Betty Garma published there her article *Surgimiento de ansiedades analsadomasoquísticas enquistadas, por fracasos en la latencia* (Emergence of analsadomasochistic entrenched anxieties, due to latency failures) and was named as collaborator in the presentation of the book together with Susana Lustig de Ferrer (1934–2004) and Pola Ivancich de Tomas.

In 1974, 2 years after the death of Arminda Aberastury, Betty Garma founded the *Departamento de Psicoanálisis de Niños y Adolescentes “Arminda Aberastury”* (Department of Psychoanalysis of Children and Adolescents “Arminda Aberastury”) in the APA. She was also the promoter of the first studies program to obtain specialization in “Child Analyst” at the APA.

In 2001, she was declared *Illustrious Citizen* in the city where she was born, Paysandú, Uruguay (Carmen Garma, Betty Garma’s daughter, personal communication, March, 31, 2021).

Three innovative developments in Betty Garma’s work and practice allow us to place her as a pioneer in psychoanalysis. She was the first to analyze a very young child, 21 months old: He was the youngest child in the world that had been treated from a psychoanalytic approach. She performed the first presurgical treatment from a psychoanalytic perspective; she started the practice in surgical psychoprophylaxis in 1955 with two cases that had resounding success regarding the recovery in the postoperative outcome (Garma, 1992). She started to work with the first mothers’ orientation group in Argentina, at the APA offices on Juncal Street in the city of Buenos Aires (Gurman et al., 2003).

Other topics that aroused Betty Garma’s interest were related to psychosomatics, such as anorexia and other gastric disorders. She also dealt with the issues of adoptive children and

tuberculosis at Enrique Tornú Hospital, the first one in the city of Buenos Aires precisely devoted to tuberculosis. It is worth mentioning her reading “in a sexual perspective,” which together with a prevalence of interpretation over pedagogy, a predominance of a closeness viewpoint of the analyst to his patients, allowed her to assert that they can generate changes in the child even before any interpretation has been carried out (Garma, 1949).

Betty Garma was part of the first generation of child analysts in Argentina. Together with Arminda Aberastury, they immersed in the clinical practice with children at the same moment that it was in its beginnings in the center of the European psychoanalysis. They both produced innovative proposals in the field.

Functional psychology · Psychology
laboratory

Before psychology was even established as a science and profession, Jayme Grabois had his name inscribed in the history of psychology in Brazil. Grabois' academic and professional role during the first half of the twentieth century was reported in different works of the field, such as in Penna (1985) and Campos (2007). In addition, his personal accounts, briefed by Centofanti (1982), are considered important to the development of the memory of the disputes that took place during the beginning of psychology in the country.

Jayme was the son of Jews who immigrated from Eastern Europe to Latin America in the beginning of the twentieth century. Born in Argentina, his family moved to Brazil when he was still a child. The Grabois brothers studied medicine, as their parents expected. Jayme started his undergraduate course in Bahia but finished it in Rio de Janeiro, at University of Brazil [Universidade do Brasil] that later became the Universidade Federal do Rio de Janeiro (Federal University of Rio de

Janeiro). In 1929, still in his early 20s, he started working at the Laboratório de Psicologia da Colônia de Psicopatas do Engenho de Dentro (Psychological Laboratory of the Psychopaths Colony of Engenho Novo), under the guidance of the Polish psychologist Waclaw Radecki, who besides assisting the patients developed scientific research and technical training for professionals involved in the area. According to Centofanti (1982), the laboratory had several state-of-the-art equipments, including esthesiometers, ergographs, denamometers, reflexometers, aesthiometers, tonometers, troposesthesiometers, chromatosthesiometers, tachistoscopes, mnemometers, polygraphs, and oscillometers, among others.

During the 1930s, working as Radecki's assistant, Grabois had the chance to meet Édouard Claparède (1873–1940) and Wolfgang Köhler (1887–1967) on the occasion of their visit to the country. Grabois was paramount to the spread of Claparède's ideas in Brazil. The first Brazilian edition of *L'Éducation Fonctionnelle*, one of Claparède's most important works, was published in 1933 under the title *A Educação Funcional* (The Functional Education) by Companhia Editora Nacional with translation and notes by Jayme Grabois.

In 1931, a group of Radeckis assistants published a number of articles in which they articulated applied psychology with areas such as education, law, and medicine. Centofanti (1982) explains that Grabois' article, focusing on the relation between medicine and psychology, shows the high-intellectual level of the workers of the laboratory. In 1932, two other works – “The Experimental Contribution to the Psychology of Conceptions” and “The Voluntary Formation of the Representations,” coauthored with Euryalo Canabrava (1908–1979) – were submitted to the 10th International Congress of Psychology, in Copenhagen. Even though there is no evidence that the articles have been published on the occasion of the conference, one of them was published in Brazil in 1936. The Institute of Psychology played an important role in Grabois' professional life as he worked in the Colony until 1937.

In 1937, relying on the law that created the University of Brazil, Grabois and Canabrava

founded the Institute of Psychology as part of the university. Hence, in 1937, Jayme Grabois became the first director of this new Institute, which was now located in the Academic area and was independent from psychiatry, working as a supplementary research member of the Faculdade Nacional de Filosofia (National Faculty of Philosophy). During his time as director of the institute, Jayme Grabois made an effort to develop the three axes that are now considered to be the tripod that supports the Brazilian University, i.e., teaching, research, and extension. His 1943 activity report makes reference to the development of scientific research, to teaching activities, and to applied psychology. Besides, the report alludes to the need of a major in psychology, an undergraduate course which was finally established in the 1960s. Other striking elements in Grabois' term as director of the Institute of Psychology of the University of Brazil [Instituto de Psicologia da Universidade do Brasil] concern his managing skills, such as his attentive care with the equipments – most of them had been part of the Psychological Laboratory of the Psychopaths Colony of Engenho Novo – and the maintenance of the library located in the headquarters of the Institute, downtown Rio de Janeiro.

Grabois was the director of the Institute for a decade and gathered a number of young intellectuals around himself and the institution. He was regarded at the time as a brilliant professor due to his remarkable rhetoric, and the easiness with which he could communicate with all. After he left the university, Grabois dedicated himself to being a clinical psychologist until the end of his life. Controversies surround the early interruption of his academic and institutional life. These controversies point out to the disputes that mark the institutional, affective, and political history of the beginning of psychology in Brazil.

One of Jayme Grabois' brother, Mauricio Grabois (1927–1973), was first a member of the Partido Comunista Brasileiro (Brazilian Communist Party) and later a member of the Partido Comunista do Brasil (Communist Party of Brazil). Mauricio served as an elected congressman in 1946, during the short period that the Communist Party was not outlawed. Jayme was also a member

of the Party but not an activist. Nevertheless, due to his relation to Mauricio, Jayme also became a target of the “marxist” scrutiny which set the tone of the time. According to Centofanti (1982), on the occasion of the renewing of his labor contract, the following personal information had been gathered: that he had received his membership card of the Communist Party during a public session at Clube Ginástico Português (Portuguese Sporting Club) that he had been the Dean of the Universidade do Povo (People's University), related to the Movimento Unificador dos Trabalhadores (Unified Labour Movement); that he had called the middle class to a political rally in an urban circulation area known as “Largo da Carioca”; and that he was the brother of Mauricio Grabois, a “red congressman.” Even though a political persecution was crystal clear, on the occasion of Jayme Grabois' being dismissed from the university, Antonio Gomes Penna, a former student of Grabois at the Institute La-Fayette, argues that the reasons for the dismissal were strictly bureaucratic, as the university started to request that directors of institutes be professors of the discipline related to them. Nilton Campos (1989–1963), also a former assistant of Radecki, became the new director of the Institute and served there until his passing. Despite being an enthusiast of Jayme Grabois, Penna (1985, p. 18) states that the doctor was not able to produce as much as he could have on account of his high qualification because “his excessive critical severity which did not spare even himself¹” ended up harming a career that “should have been radiant.” In 2008, on the occasion of the 100th anniversary of his birth, Jayme Grabois was awarded with a posthumous tribute in which he was readmitted at the Federal University of Rio de Janeiro in a ceremony conducted by Aloisio Teixeira (1944–2012) who served as dean at the time. Some years earlier, the Brazilian Ministry of Justice had declared Grabois a postmortem political amnestied, granting financial reparation to both his widower, Dinah Cohen Grabois, and his ex-wife, Golde Fildeman. The granted amnesty was a recognition that Grabois had been laid off from the Universidade do Brasil (University of Brazil) due to political persecution.

Even though his relationship to the academic aspect of psychology can be considered brief, Jayme Grabois showed his love to the profession and had his name included as one of the “pioneers” of this field in the country and contributed to its history and construction of memory. His bibliographic collection, with a number of books related to the world of psy-knowledge in different languages, was preserved by Dinah Grabois, who donated a series of volumes in order to add to the Jayme Grabois Collection of the Laboratório de História e Memória da Psicologia – Clio-Psyché (Laboratory of History and Memory of Psychology – Clio Psyché) of the Universidade do Estado do Rio de Janeiro (University of the State of Rio de Janeiro).

Grados Espinoza, Jaime Ángel

Born *Mexico City (México), 4 January 1942*

Juan Manuel Herrera Caballero
Autonomous Metropolitan University (UAM),
Mexico City, Mexico

Keywords

Mexico · Organizational psychology ·
Decision-making · Communication process

Grados received his Bachelor’s degree in Psychology from Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM) in 1974. He also attended UNAM for both his Master (1979) and Ph.D. (2016) in Social Psychology.

His work has ventured into the world of production from industrial and labor psychology, to the integration of organization theory, as well as the different trends that exist within the history of administration. At the same time, his intervention work within companies has been developed without losing the identity of being a psychologist within an organization.

He has stood out for the application and adaptation of psychometric tests for companies, such as Inventario de Medición de Talento Humano (Human Talent Measurement Inventory) (IMETH) and the test of incomplete sentences with application to industry (FIGS), among others (Grados, 1988). He is an expert in topics that affect the improvement of productive practices like benchmarking, empowerment, outplacement, outsourcing, coaching, e-learning, etc., and the effectiveness of the administrative processes; these issues are seen from both, organizational psychology and the administration itself, and its virtue lies in the sensitivity toward the commitment of individuals with life and work.

Mental health is a critical factor throughout all of his contributions. Although his work is expressed through the papers that accompany the production and performance processes with quality, which require a high profile for the fulfillment

of the tasks that are carried out within an organization, in his theoretical contributions *he places in the first place the importance of having healthy individuals* in organizations with capabilities and abilities that aspire to have a better life.

He has updated the work developed by Frederic Winslow Taylor (1856–1915) and Henri Fayol (1841–1925), classical administration authors, as well as Jeffrey Pfeffer (born 1946), and Stewart Clegg (born 1947), among others, that have strengthened the organization theory *as an entity with structure*, functions, and its own strength that goes beyond the capacities of the individual who is able to face both the market and the production processes.

This intersection of *the needs and aspirations of the individual* with the demands of an organization is a scheme that Grados has been able to decipher in a practical and effective way of work, which, although remunerative for the organization, is also the same way for the individual.

A current concern that arises in the study of organizations is the effort that individuals allocate into their work and involvement with it. The solution has been oriented today, toward a better selection and recruitment of the organization personnel. In his contribution *La entrevista en las organizaciones (The Interview in Organizations)* (2017), he exposes the virtues of proposing a model for the classification and application of the interview in organizations from a propositional perspective under a systemic approach in order to face the demands of modern societies.

A very important factor in the workplace is teamwork, which according to Grados is summarized in “the relationship that is generated between well-communicated individuals and a healthy work environment; these two requirements will improve the quality of work, since a motivated individual gives his best effort” (Grados, 2017: 48). He does not see the individual and the organization as antagonistic, but as parts of a complementary machinery for an organization to function properly in the labor aspect. And it is here where the consulting skills of Grados, together with his vision as a social psychologist, help him with the

pertinent use of innovative tools for diagnoses within an organization (Grados, 2006a).

Therefore, according to all of his production, for Grados, *job satisfaction* is a set of attitudes and aptitudes toward work that can be described as the subject psychological disposition toward his job (what he thinks about it) which also implies a group of attitudes and aptitudes toward different elements, the result of different perceptions and expectations that employees have toward their work. Speaking about job satisfaction does not only refer specifically to employment, but it also implies different variables of the labor context (Grados, 2006b).

The idea of reciprocity through a transaction mechanism means giving and receiving is fundamental for the performance of individuals within the organization. All social interaction has a price, where they try to have a better relationship for themselves, that is, individual interaction consists of sanctions and rewards, and the response of each individual to the other in accordance with the “retribution” that each one receives. What is done, and how much is done, depends on the quantity and quality of the reward obtained. This is how Grados has carried out effective work throughout his life in companies and universities, through the training of human resources and has not ceased to focus also on profitable work and healthy life for individuals within of organizations.

Jaime Grados is the founder of Sociedad de Psicología Aplicada, A.C. (Society of Applied Psychology, C.A.), former president and vice president of Asociación de Psicólogos Industriales A.C. (Association of Industrial Psychologists, C.A.) and vice president of Asociación Mexicana de Capacitación (Mexican Training Association), as well as president of Asociación de Psicología Industrial A.C. (Industrial Psychology Association, C.A.). Since 1972, he has been a full-time professor at UNAM; in 2008, he received the Premio Mexicano de Psicología (Mexican Prize for Psychology) Federación Nacional de Colegios, Sociedades y Asociaciones de Psicólogos de México (National Federation of

Boards, Societies and Associations of Psychologists of Mexico) (FENAPSIME) for his contributions to the psychology of work.

Granero, Mirta Graciela

Born in Rosario (Argentina), November 17, 1941

Miguel Gallegos

Pontificia Universidade Católica de Minas Gerais, Belo Horizonte, Brazil

Universidad Nacional de Rosario, Rosario, Argentina

Consejo Nacional de Investigaciones Científicas y Técnicas, Buenos Aires, Argentina

Keywords

Argentina · Sexology · Psychotherapy · Cognitive-compartmental

Mirta Graciela Granero is the daughter of Serafin Granero and María Irma García and grew up in a typical middle-class Argentinean family of Spanish descent. Her father was a salesman and her mother a housewife. When studying psychology in 1962, at the age of 21, she met her partner J. Ricardo Musso (1917–1989). Musso had been Principal of the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) at the Universidad de Buenos Aires (University of Buenos Aires) and later Principal of the School of Psychology in Rosario. They had a daughter, Silvana Musso, who followed her parents' footsteps in the field of psychology. The Musso-Granero formed a couple out of love, respect, and mutual interests in parapsychology, psychology, and the problems arising from sexuality.

For many years, they worked together, organized groups of study, created institutions, and published a large number of scientific papers. Their home and their extensive home library were open to university professors and students alike. Mirta's sister, María Cristina Granero, also graduated in psychology from Rosario and shared scientific and other professional activities with the couple.

Mirta Granero graduated as a teacher from Escuela Normal N° 1 de Rosario (Rosario's

Normal School N° 1) in 1959 and dedicated several years of her teaching career to working with children with functional diversity. Later, in 1968, she obtained her degrees in Psychologist and Professor of Psychology at the Universidad Nacional del Litoral (National University of the Litoral). For her postgraduate studies, she focused on sexual education, behavior analysis and modification, cognitive-behavioral psychotherapy, and research methodology.

Initially, she felt strongly attracted to statistics and paranormal phenomena. With Ricardo Musso, she conducted a number of parapsychological studies that gained international notoriety that led them to establish a close relationship with the founders of US parapsychology: Joseph B. Rhine and Louisa Rhine from Duke University. Several invitations to the USA followed (Granero, 1994b; Musso & Granero, 1973; Parra, 2010). Nevertheless, her professional trajectory included other activities such as university professor, human sexuality researcher, cognitive-behavioral psychotherapist, and sexuality educator. She got accredited as Behavior Analyst from the Asociación Latinoamericana de Análisis y Modificación del Comportamiento, ALAMOC (Latin American Association of Behavioral Analysis and Modification) in 1986. In addition, she was accredited as a clinic and educational sexologist by other important national and Latin American Institutions.

Granero has been a professor of numerous specialization courses and an invited keynote speaker to multiple Latin American countries such as Argentina, Bolivia, Chile, Colombia, Mexico, Paraguay, Peru, and Uruguay. Furthermore, she also obtained numerous scholarships and received many distinctions for her scientific works and her professional trajectory in Argentina and Perú. One highlight is the Lifetime Trajectory Medal awarded by the Federación Latinoamericana de Sociedades de Sexología, FLASSES (Latin American Federation of Societies of Sexology and Sexual Education), in 2016.

Granero has been a founder of various scientific societies related to her specializations such as the Instituto Rosarino de Parapsicología (Rosarian Institute of Parapsychology: 1973–1977), the Instituto

de Estudios Contemporáneos (Institute of Contemporary Studies: 1972–1976), the Instituto de Psicoterapias Modernas (Institute of Modern Psychotherapies: 1972–1976), the Asociación Rosarina de Educación Sexual y Sexología, ARESS (Rosarian Association of Sexual Education and Sexology), in 1976, the Instituto Kinsey de Sexología de Rosario (Kinsey Institute of Sexology in Rosario), in 1983, and the Federación de Sexólogos Argentinos (Federation of Argentine Sexologists), in 1998.

From 1976 to 1983, Argentineans lived under a military dictatorship that curtailed civil and political rights and committed gross human rights violations. Public national universities and psychology programs were greatly disrupted. Subject areas were ideologically controlled and censored, while countless professors were purged, persecuted, detained, and even disappeared.

In Granero's case, she was terminated as a university professor and endured political imprisonment for many months. In addition, many institutions she founded were shut down during the military dictatorship. Still, regardless of the socio-political climate, in 1976, together with colleagues, she created the Rosarian Association of Sexual Education and Sexology, where she served as part of its board of directors until recent times, leaving the presidency in 2020. The motto of this foundation was: "Ante tanta Muerte, la sexualidad es Vida," which translates into "In the face of so much death, sexuality is life."

During the time of the dictatorship, she dedicated herself to private practice and furthered her education into new perspectives of Behavioral Cognitive psychotherapy. Despite the repressive context in such a dictatorship, she managed to continue her studies about human sexuality. When she got out of jail and joined her partner Musso, they both taught a course of Behavioral Psychotherapy, probably one of the few existing in the country in that therapeutic line in the 1970s; it was developed at the Institute of Contemporary Studies, which was forced to close due to the dictatorship.

Among her professional duties, she is recognized for her leadership and active participation as board director and member of multiple sexology

societies in Argentina and Latin America. In addition, she organized multiple scientific events about sexology across the region. She was a well-known trainer of new generations of sexologists, therapists, and professionals in the health field, particularly in psychology.

Granero has had an important connection with the university context of Rosario, being among the first generations of psychology graduates in the city. It should be noted that the first undergraduate Program in Psychology in Argentina was founded in the city of Rosario in 1954 (Gallegos, 2005; Gallegos and Berra 2016). At that institution, Granero taught psychostatistics (1963–1966), general psychology (1972–1974), and later in research methodology in psychology (1972–1974/1988–2014).

At the Facultad de Psicología (Faculty of Psychology) at the Universidad Nacional de Rosario (National University of Rosario), she developed and taught the first courses on Sexology and Cognitive Behavioral Therapy. In 2017, she started teaching a specialty in Cognitive Behavioral Psychotherapy at the same university. She served as director of research projects that included pioneering studies on sexuality in mental disability, homosexuality, and gender issues in the early 1980s in Argentina (Milanesio, 2019). Other research focused on the personal lives of psychotherapists, HIV/AIDS, and human sexuality. She served as the director of several postgraduate theses of numerous professionals in the health field in Argentina. Within the Kinsey Institute of Sexology, she directed more than 20 specialized postgraduate courses and trained more than 700 sexologists.

After retiring from university professorship, Granero continued to be very active as a lecturer, member of professional societies, writer, and private practice therapist. She is recognized as one of the pioneers in the field of research and professional practice of human sexuality and cognitive behavioral therapy in Argentina.

Greve Schlegel, German

Born *in Valparaíso (Chile) on November 19, 1869*

Died *in Santiago (Chile) on September 5, 1954*

Mariano Ruperthuz Honorato
Universidad Andrés Bello, Santiago, Chile

Keywords

Chile · Psychoanalysis · Mental hygiene · Sigmund Freud

German Greve Schlegel was born in Valparaíso, the principal port of Chile, in 1869, the place where he did his primary studies. His family, of German origin, in 1882, moved to the capital, Santiago de Chile, the city where Greve lived until he died in 1954. His student training was carried out in the principal establishments of the country: the *Instituto Nacional* (National Institute), where he attended high school, and the *Universidad de Chile* (University of Chile), where he entered in 1886 to carry out his university studies. Following a family tradition, he graduated as a pharmacist first in 1889 – his father, Germán Greve Lemcke, graduated as a pharmacist at the University of Rostock (Germany) – and then on October 3, 1892, he also graduated as a physician at the University of Chile.

Germán Greve's relationship with the study of mental illness began as soon as he received his medical degree. At the beginning of 1893, Greve, 24 years old, was commissioned by the Government of Chile to tour Europe to learn about the advances in the construction of asylums and the use of electrotherapy. His five-year stay (1893–1898) allowed him to visit different clinics and universities in Germany, Austria, and France; he is said to have worked in the laboratory of the physiologist Rudolf Virchow (Greve Silva, 1969). The findings of his European trip were published in *Revista Médica* Medical (Medical Journal) 1894 and 1895. Greve pointed out that Charcot used electrical discharges to stimulate those areas of the nervous system where the “invisible lesions” of hysterical patients were located (Greve, 1895).

Entering into contact with Sigmund Freud in 1894, at the Congress of German naturalists and doctors in Vienna (Molnar, 2011; Ruperthuz, 2014). Back in Chile, Greve became an enthusiastic diffuser of psychoanalysis, but he had to face the criticisms that the medical circle made of Freudian theories. The critics of Freud ideas claimed that these ideas could present a social danger because of the very concept of the unconscious apparently freed individuals, primarily criminals, from the responsibility of their acts. Furthermore, in emphasis on the sexual – pansexual – element of psychoanalytic theory and the low somatic support of its conclusions, were critical points for Chilean doctors (Plotkin & Damousi, 2009; Plotkin & Ruperthuz, 2017).

Greve's immortality in the psychoanalytic world came about thanks to Freud's mention of his historical work in 1914 (Freud, 1914/ 1917). Four years earlier, in Buenos Aires, Greve presented in the *Congreso Internacional Americano de Medicina e Higiene* (International Congress of American Medicine and Hygiene) his work entitled *Sobre psicología y psicoterapia de ciertos estados angustiosos* (About Psychology and Psychotherapy of certain anguishing states) (1910), in which he presented psychoanalysis, detailed the main points of the theory, and explained the specificities of the Freudian technique. Interestingly, Greve, in this work, tried to reconcile the

work of Sigmund Freud and Pierre Janet, demonstrating the predominance of the latter in the Latin American medical environment (Ruperthuz 2012). Freud ignored that and noted: “A doctor from Chile (probably a German) appeared at the International Congress in Buenos Aires, in 1910, and spoke on behalf of the existence of infantile sexuality and praised the results of psychoanalytic therapy in obsessions” (Freud, 1914/ 1917, p. 22).

Freud’s reference complemented his commentary in the *Zentralblatt für Psychoanalyse* (Central Journal of Psychoanalysis) (Freud, 1911). For Greve, the analysis was a powerful research tool, and it was sure to bring relief to patients, but it had to overcome problems associated with its extension over time and the need for intelligent and committed patients. Beyond his work in Buenos Aires, Greve did not remain affiliated with psychoanalysis or at least did not republish anything on the subject. He turned to private psychiatric practice, participated in the field of criminology as an expert, and was an active member of the *Asociación de Beneficencia Pública* (Association of Public Charities) since 1918. In this field, he was Director, for twenty-three years, of the *Beneficencia Pública* (Journal of Public Charity), being renamed, in the 1930s *Revista de Asistencia Pública* (Journal of Public Assistance), and demonstrated the professionalization of the field. He was also subadministrator of Public Assistance and administrator of hospital services, establishing himself as a great exponent of the ideas of mental hygiene (Amunátegui et al., 1918; Greve, 1923; Ruperthuz, 2016).

The psychiatrist Haim Grünspun, who occupied seat number 19 in the Academia Paulista de Psicologia (Paulista Academy of Psychology) (Ades, 2008), was born in Romania in 1927. The marks of his formation in Jewish culture can be seen in his autobiographical work entitled “Trem para o hospício” (Train to the hospice) (Grünspun, 1980), in which he reports his arrival in Brazil at the age of five and describes two of his paths: the academic – university education – and by public transport to get to Franco da Rocha, a municipality in Greater São Paulo, trips he made by train with other medical colleagues to the psychiatric hospital where he carried out practical studies, to become a doctor with a specialty in psychiatry. He graduated in Medicine by the Universidade de São Paulo (University of São Paulo) in 1952 and completed his residency in psychiatry in 1956. He also studied at Law school, graduating in 1970.

He began his teaching career, giving subjects relevant to psychology at the Psicologia na Pontifícia Universidade Católica de São Paulo (Pontifical Catholic University of São Paulo) and Instituto Sedes Sapientiae (Sedes Sapientiae Institute), where he was for more than two decades – from 1953 to 1975, focusing on the social dimension of children and adolescents. At the same institution, he created the Psicoterapia Lúdica (Ludic Psychotherapy) course in 1953.

Grünspun conducted research on families, professional guidance, neuropsychiatric, and psychopathology and recorded them in twenty books that demarcate both the individual’s place and what matters, according to him, for his constitution: his history, his relations with the cultural environment, his lifetime, and their biological and social conditions of existence. A pioneer in child psychiatry studies in Brazil, Grünspun defended the psychological dimension as a standard for the construction of children’s behavior, as the concept of not considering issues of the physical body as unique to health and/or disease. Brazil only enacted the Estatuto da Criança e do Adolescente (Child and Adolescent Statute) in 1990. In this sense, before this date, Haim Grünspun’s definitions about this audience already guided the defense of children and young people as subjects with rights and needs.

Haim valued the exchange of information, evaluations, and opinions between multiple professionals, such as lawyers, physicians, psychologists, etc., building a systemic view of individuals. The significant number of editions of his works demonstrates how much his ideas have contributed to studies on children.

He has published more than 50 articles in scientific journals on three main lines: autobiographical records, childhood disorders, and family relationships. Research on children’s disorders has addressed, over time, three points: psychiatric disorders in 1961, neurotic disorders in 1965, and psychosomatic disorders in 1980. The function of schooling and the role of teachers in human development were present in his works. The foundation of Escola de Pais (Parents School), an institution cocreated in the 1960s, and the foundation of Associação Brasileira de Neurologia e Psiquiatria Infantil (Brazilian Association of Neurology and Child Psychiatry) confirm this aspect of his performance and professional attention in the field of psychology.

Haim Grünspun’s notes on the development and interactions of children and young people were based on evidence from psychometrics, such as tests and scores to measure resilience, quantitatively and qualitatively pointing out the profile of the analyzed child and their conditions of being resilient in adverse situations, an approach that guided his latest studies and contributed to a new perspective on the subject. Haim contributed to the initial and continuing education of many professionals from various fields of knowledge, such as education, health, and law, regarding family relationships, individual development, psychopathological conditions, gamification, and conflict mediation.

Guardia-Mayorga, César Augusto

Born *Lampa (Ayacucho, Peru)*, May 15, 1906

Died *Lima (Peru)*, October 18, 1983

Walter Arias
Universidad Católica de San Pablo, Arequipa,
Peru

Keywords

Peru · Marxist psychology · Teaching of psychology

César Augusto Guardia-Mayorga studied at the Universidad Nacional de San Agustín (National University of San Agustín, UNSA, Arequipa),

obtaining a Ph. D. in 1937, the year in which he joined the teaching profession in his *alma mater* (history of philosophy and general and developmental psychology).

At the beginning of 1952 during the military government (1948–1956) of General Manuel A. Odría (1897–1974), he was removed from university due to his leftist political position. He goes into exile in Bolivia and restarts his teaching work at the Universidad Mayor de San Simón (Major Saint Simon University, Cochabamba). In 1956 he was granted amnesty, but with the impediment of exercising university teaching in the country. After a period of unemployment, in 1960 he began to teach psychology and philosophy at the Universidad Nacional de Huamanga (National University of Huamanga, Ayacucho) but was separated in less than a year because his Marxist thought was very influential among students. In 1963 he was arrested by the police. Released, he began to teach at the Universidad San Luis Gonzaga (Saint Luis Gonzaga National University, in Ica, south of Lima) between 1963 and 1967, when he retired because he had reached retirement age.

Guardia Mayorga developed his work taking dialectical materialism as the guiding thread, both in scientific and social and political matters (Arias, 2016). He defended the vindication of the Peruvian autochthonous race and the revaluation of the indigenous culture, for this reason he published a Quechua-Spanish and Castilian-Quechua dictionary (Guardia-Mayorga, 1959) and a book on Quechua grammar (Guardia-Mayorga, 1973). With these works, he presents himself as a pioneer of intercultural and bilingual education and psycholinguistics.

Author of a large number of books that dealt with psychology, philosophy, the Quechua language, and also historical aspects, Guardia Mayorga had a checkered academic career due to his political positions. In the case of psychology, the influence of Pavlov's ideas and Marxism is recognized in his work (Guardia-Mayorga, 1967).

Guardia Mayorga's work has been described as an emancipating psychology with a dialectical materialist stamp (Oliveros, 2010), and even as a predecessor of liberation psychology, for having anticipated the notions and concepts of Ignacio Martín-Baró (1942–1989) (Cornejo, 2016).

Guenther, Zenita Cunha

Born *Cruzeiro/SP – Brazil, on June 19, 1937*

Adriana Araújo Pereira Borges
Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

Keywords

Brazil · Humanist · Endowment · Talent

Zenita Cunha Guenther is a Brazilian psychologist dedicated to the field of special education,

specifically to the study of gifted and talented children. She graduated in psychology in 1969, completed a Masters in Guidance and Counseling in 1972, and a Ph.D. in 1977 in educational psychology, all courses taken at the University of South Florida, the USA. She held a postdoctoral degree in 1995 at Purdue University.

Her professional and academic career was strongly influenced by the relationship established with the psychologist Helena Antipoff. Although Zenita was born into a low-income family, she and her nine brothers (with two adopted brothers) were supported and encouraged to study. At age 12, she was selected in the campaign promoted by Helena Antipoff, “Cérebros da Educação” (Education Brains), to enter as a student at Fazenda do Rosário, in the rural normalist course. After completing the course, she was invited to stay at the farm and teach for the annex class, created for the pedagogical practice of the normalists. Between 1957 and 1958, she was classified for the Technical Course of School Guidance and Administration at the Minas Gerais Education Institute, later transformed into a pedagogy course. At the request of Helena Antipoff, she was an assistant at the Édouard Claparède (1873–1940) Bio-socio-psychopedagogical Studies Laboratory, founded in 1959 at the Instituto Superior de Educação Rural at Fazenda do Rosário. In 1962 she was selected for a fellowship in the USA, in the Alliance for Progress Program (1962–1963), where she completed a specialization in preschool education at Indiana University. She returned to Brazil, to a scholarship requirement, to work in the country for two years. Afterward, she returned to the USA, where she completed her undergraduate and master’s degrees. After her master’s degree, she joined the Federal University of Minas Gerais (UFMG) as a professor. She participated in the creation of the Masters in Education in 1972. In 1973 she returned to the USA for her doctorate. She remained at UFMG until her retirement in 1983.

She is the author of 20 books and about 100 papers, published in scientific magazines and journals in Brazil and abroad. Her academic production is focused on the theme of the gifted and talented. She collaborates as a speaker, guest lecturer, and visiting professor at universities,

colleges, and teacher preparation entities in the various states of Brazil and in other countries. In 1992, she founded the Center for the Development of Potential and Talent (CEDET) in the city of Lavras, Minas Gerais, Brazil, recognized by the European Council of High Capacity as a Center for Talent Development. One of CEDET's objectives is to identify superior talents and capabilities, in addition to providing follow-up and stimulation of their potential. At CEDET, differentiated activities are carried out with students, based on the values of humanism and in different areas of knowledge (Guenther, 2007). Her foundation received the support of the Rotary Club Sul de Lavras and remains active today. The CEDET model has spread to other Brazilian cities such as Poços de Caldas (MG), Palmas (TO), Vitória (ES), São José dos Campos (SP), and Assis (SP) (Ragni & Costa, 2011).

The concept of gifted and talented, surpassing the concept of super endowment, was already present in the work of Helena Antipoff. Shortly before her death, Antipoff, together with Guenther and others, established the “Wednesdays Group,” in which various themes were discussed, including the issue of nonrecognition of students with these characteristics in the Brazilian educational system. For Guenther, it would be essential to work to recognize these particularities, which, according to her, are not “super” (Guenther, 2016). Guenther defended the idea of the need to work with individual plans and the identification of talented children's interests and preferences so that they could be motivated in the learning process (Guenther, 2007). For Zenita, the school is the ideal place to identify the gifted, as the family tends to value only verbal intelligence, disqualifying nonlinear intelligence, one that only needs the context, “where the person observes the whole and sees possibilities” (Ferreira & Barboza, 2008). The contribution of Zenita Guenther's work to psychology in Brazil can be attested to its national and international recognition. Her biography was included in the “Who is Who in the World” in 2006. Her name has established itself as one of the main references in the field of gifting and talent, both in Brazil and in other countries.

Peru · Psychiatry · Counseling

Peruvian psychiatrist. He entered the Universidad Nacional Mayor de San Marcos (National University of San Marcos, UNMSM) in 1928, studying the first 2 years at the Facultad de Medicina de San Fernando (San Fernando Faculty of Medicine), after which he traveled to Germany and entered the Ludwig-Maximilian-Universität (Ludwig Maximilian University, Munich), studying biology, and between 1935 and 1938 also at the universities of Vienna, Berlin, to specialize in psychiatry.

He returned to Peru in 1940 and revalidated his medical studies, after which he joined the Chair of Psychiatry at the UNMSM directed by Honorio Delgado (1892–1967), with whom he collaborated closely until 1955. One of his most important contributions was, together with Delgado, the “Guideline for psychiatric clinical history” (Delgado & Guerra, 1950; Salaverry & Delgado, 2000), which was used for years. For 25 years, he worked at the Hospital “Víctor Larco Herrera” (Víctor Larco Herrera Hospital). In 1954, he was one of the founders of the Sociedad Peruana de Psicología (Peruvian Psychology Society). In 1973, he got a doctoral degree in education (UNMSM), which awarded him the title of Professor Emeritus in 1982.

In 1941, the Ministry of Education of Peru formed a commission made up of Julio Chiriboga (1896–1956), Luis Aquiles Guerra and Walter Blumenfeld (1882–1967) to formulate the proposal for the organization of an institute that would be in charge of the comprehensive study of children and adolescents and suggest the

technical standards of education in Peru. As a result of this work, the Instituto Psicopedagógico Nacional (National Psychopedagogical Institute) was created, to which prominent specialists were incorporated, among them Guerra (who was in charge of the Departamento de Paidología Especial (Special Paidology Research Department). The Institute, over the years, became an institution that promoted research in developmental psychology and pedagogy.

Immediately after his retirement from the Faculty of Medicine, he joined the Faculty of Philosophy and Humanities of UNMSM, dedicating himself to teaching Counseling and Psychological Orientation courses, and proposing the creation of the Consultorio Psicológico (Psychological Clinic), which took place on October 29, 1957, initially dedicated to the attention of the university students but that, over the years, has expanded its work outside the university walls (Orellana et al., 2007). Later incorporated to the Faculty of Education, Guerra took charge of the Mental Hygiene and Psychopathology courses.

The work of Luis Aquiles Guerra has been of great importance in the field of educational psychology in Peru, both in terms of research and in treatment and prevention. It also played a very important role in the training of specialists in the field of pedagogy and educational psychology (Alarco, 1989; Alarcón, 2000).

Alberto Guerreiro Ramos is the son of conductor Víctor Juvenal Ramos and washerwoman Romana Guerreiro Ramos. After the death of his

father, he moved with his mother to Salvador, the capital of the state of Bahia, and began his literary career by the age of 17, working for the Bahian newspaper *O Imparcial* (The Impartial). Around that time, he participated in the Ação Integralista Brasileira, AIB, in Portuguese (Brazilian Integralist Action), a conservative and ultra-nationalist fascist-oriented political movement, joining its Catholic-inspired wing. Due to his journalistic activities, he also took part in several social movements in Bahia, which strengthened his personal and political relationships with eminent figures of the Bahian elite. His first book, “The drama of being two” was published in 1937, with poems of strong religious inspiration. During the period of Landulfo Alves de Almeida’s interventionist administration (1893–1954, in office 1938–1942) in the state of Bahia, he received a scholarship to study social sciences at the Faculty of Philosophy of the University of Brazil (UB) and settled in Rio de Janeiro, the country’s capital at the time, in 1939. In the federal capital, he proceeded with his law studies, graduating in social sciences from the National Faculty of Philosophy in 1942 as well as from the National Faculty of Law of the UB in 1943.

He remained in Rio de Janeiro after being appointed by Custódio Sobral Martins de Almeida as interim administration technician in the Administrative Department of the Public Service (DASP), giving sociology courses in that institution and contributing to the *Revista do Serviço Público* (Public Service Magazine), the oldest periodical focused on themes related to Brazilian Public Administration. After passing the civil service entrance examination, he was approved in 1949 for the position of administrative technician in the permanent staff of the DASP. In 1951, he held an advisory position in the Civil House under the government of President Getúlio Dornelles Vargas (1882–1954, in office 1930–1945), designated by Rômulo Barreto de Almeida (1914–1988). He remained in this position until 1954. He was the founder and dean of the Brazilian School of Public Administration of the Getúlio Vargas Foundation (EBAP/FGV), the first public administration school in Brazil and Latin America, created in 1952. There he taught sociology courses and

delivered training in public administration. He also joined the “Group of Itatiaia” (*Grupo de Itatiaia*), formed in 1952 by intellectuals who reflected upon the defense of the Brazilian State, its development, its rationalization, and public management. Its participants – Hélio Jaguaribe de Mattos (1923–2018), Roland Cavalcanti de Albuquerque Corbisier (1914–2005), Cândido Antônio José Francisco Mendes de Almeida (1928–), Nelson Werneck Sodré (1911–1999), among others – founded the Instituto Brasileiro de Economia, Sociologia e Política, IBESP (Brazilian Institute of Economics, Sociology and Politics) in 1953 and edited the magazine *Cadernos do Nosso Tempo* (The Notebooks of Our Time) – (1953–1956). In 1955, this Institute became the Higher Institute of Brazilian Studies (ISEB), which was the promoter of the Brazilian national developmentalist ideology, and in which Guerreiro Ramos was the director of the sociology department.

In 1954, Guerreiro Ramos published the book *The Brazilian Primer of the Apprentice Sociologist: Preface to a National Sociology*, which was later republished, in 1957 and 1995, with a new title: *A Critical Introduction to Brazilian Sociology*. The book was practically ignored at the time of its release but was later regarded as being quite innovative, addressing topics scarcely discussed in Brazilian and Latin American sociology. Guerreiro Ramos was Brazil’s delegate at the XVI UN General Assembly in 1961, discussing the importance of trademark and patent law. He ran as a candidate for Federal Deputy of the State of Guanabara in 1962 for the Brazilian Labor Party (PTB), assuming a mandate in the 1963–1967 legislature on August 21, 1963, as a substitute for Congressman Rubens Berardo. In congress, he presented the first legislative bill on the professionalization of administration technicians on September 4, 1963 (Project n° 984/1963), which ultimately resulted in the law that regulated the administration technician profession (law n° 4769 / 1965).

He lost his mandate on April 17, 1964, because of the installation of the Military Dictatorship, which enacted the Institutional Act No. 1 (of April 9, 1964) that revoked legislative mandates and

suspended political rights for a period of 10 years – the military dictatorship as a whole lasted from 1964 to 1985. Because of this suspension and of the publication of the book *Administration and Development Strategy: Elements of a Special Sociology of Administration*, he settled in the United States of America in 1966 and began teaching in the public administration doctoral program of the University of Southern California (USC). After the promulgation of the Amnesty Law (n° 6683 / 1979), he returned to Brazil and became a professor at the Federal Universities of Santa Catarina (UFSC) and the Federal University of Paraná (UFPR).

Guerreiro Ramos was also a member of the Teatro Experimental do Negro, TEN, in Portuguese (Black Experimental Theater), the main Brazilian black movement of the 1940s and 1950s. In it, he devised proposals on the role of black people and how it would be possible to build a new social reality for them, based on the psychodynamic model. During this period, he wrote for the newspaper *Quilombo* (from 1948 until 1950), participated in the organization of the National Black Conference (1949) and the 1st Brazilian Black Congress (1950), together with Abdias Nascimento (1914–2011) and Edison de Souza Carneiro (1912–1972). At this Congress, he presented a thesis proposing that UNESCO “evaluate the possibility of organizing an International Congress on Race Relations” to develop sociological and psychological strategies with the support of the TEN, as a way to minimize or eliminate racial discrimination in the country (Nascimento, 1982, p. 235). Within the TEN, he also held the position of director of the Instituto Nacional do Negro, INN (Black National Institute), one of the entities responsible for giving courses in the areas of education, culture, and professional training for black people, which were perceived at the time as fundamental sectors for the improvement and social ascension of the black population.

Guerreiro Ramos can be considered as the pioneer of the use of psychodrama in Brazil, since he used psychotherapeutic practices through the social technique that he named “Group Therapy,”

which was applied to treat the suffering and distress of the black population. The technique was based on the psychodrama and sociodrama model developed by Jacob Levy Moreno (1889–1974).

Guerreiro Ramos' main intellectual influences were Jacques Maritain (1882–1973), Nicolas Berdiaeff (1874–1948), Karl Mannheim (1893–1947), Karl Marx (1818–1883), Émile Durkheim (1858–1917), Donald Pierson (1900–1995), and in particular Max Weber (1864–1920). Guerreiro Ramos got married on March 31, 1947, with Clélia Calazans Rodrigues de Paula, a librarian who worked at the DASP and took on his surname, Guerreiro Ramos. They had two children. Alberto Guerreiro Ramos passed away at the age of 67 in Los Angeles, California, victim of cancer.

In short, Alberto Guerreiro Ramos can be considered as the introducer of psychodrama and group therapy in Brazil, as well as of its use for treating the symbolic and social effects of the widespread whitening process in Brazilian society. He analyzed and countered this process through his theory of a “social pathology of the Brazilian ‘white’,” a problem initially introduced in his book *The Brazilian Primer of the Apprentice Sociologist: Preface to a National Sociology* (published in 1954. The author was also one of the first psychosociologists to point out the subjective effects of colonialism both in Brazilian and Latin American scientific production, criticisms which he presented during the II Latin American Congress of Sociology, which took place in São Paulo, in July 1953. His criticisms are described by means of “seven recommendations,” which were presented at that Congress and were rejected. The material got republished a year later in the book *The Brazilian Primer of the Apprentice Sociologist*). His work on these two subjects are being reviewed and reread by a significant portion of the Brazilian black movement. Another significant aspect of Guerreiro Ramos' work is his contribution to Brazilian public administration and to the national development project, which resulted in the reading and discussion of his work in administration courses even at the present moment.

Luis Juan Guerrero studied at the Colegio Nacional de La Plata (National High School of La Plata), in Buenos Aires province, where he finished his high school in 1915. Afterward, he traveled to the United States where he stayed for two years in order to study natural sciences. When he returned to Argentina, he actively set in the movement that later introduced the University Reform, in which he integrated the most radical wing, the anarchist. At the same time, he collaborated with activists of syndicalism, helping them with the press activities in the

newspaper *La Protesta* and the publisher “Argonauta” (Russo de Fusari, 1971). In those years he began medical studies which eventually he dropped out to engage fully in Philosophy. In 1923, he travelled to Germany and lived in Europe until 1927. During his stay there, he studied at the Universities of Berlin, Marburgo, and Zurich getting fully involved in the philosophy of Franz Brentano (1838–1917) and Edmund Husserl (1859–1938). In Marburgo he attended lessons with Martin Heidegger (1889–1976), Paul Natorp (1854–1924), and Nicolai Hartman (1882–1950). Also, he met Hans-Georg Gadamer (1900–2002). He witnessed first-hand the publications of *Being and Time* (Heidegger, 1927/1962) and took part in scientific events related to philosophy and psychology in France, Belgium, Austria, Italy, and Spain. On July 11th in 1925, he presented his doctoral dissertation at the University of Zurich on *The Genesis of a General Theory of Values in Contemporary Philosophy*, published in German two years later (Guerrero, 1927). He obtained a degree as a PhD *magna cum lauden*, becoming the first Argentinian to get a doctoral degree in philosophy at an European university (Ibarlucia, 2008; Trías, 1971).

In 1928, he came back to Argentina and started his career as a university teacher and researcher, focusing on his three main topics of interest and at which he had a vast domain: Ethics, Aesthetics, and Psychology. In this very same year, he was appointed Professor of Philosophy at the Instituto Nacional del Profesorado Secundario (National Institute of High School Teachers) of Buenos Aires. In 1929, through public contest proceedings, he obtained the position of Professor of Aesthetics at the Facultad de Humanidades y Ciencias de la Educación (Faculty of Humanities and Educational Science) at the Universidad Nacional de la Plata (National University of La Plata). He was designated Inspector at the Facultad de Humanidades y Ciencias de la Educación (Faculty of Humanities and Educational Science) in Paraná, where he remained until September, 1930.

In 1936, he was appointed Director in the Instituto de Filosofía (Institute of Philosophy) at the Universidad de Buenos Aires (University of Buenos Aires, UBA), where he reorganized its activities and boosted the Publications Department. In 1945, he was granted the Chair of Aesthetics at the University of Buenos Aires. In 1949, he worked as Chief Administrative Secretary and hosted the sessions of the Primer Congreso Argentino de Filosofía (First Argentine Congress of Philosophy) which was held in the city of Mendoza.

In 1954, he took part in the Primer Congreso Nacional de Psicología (First National Congress of Psychology) which had its venues in Tucumán and Salta. There, he signed in for the official claim for the formal creation of a professional program in psychology.

Between 1954 and 1955, he was professor in the first undergraduate Psychology Program in Argentina, in the city of Rosario, at the Facultad de Filosofía y Educación (Faculty of Philosophy, and Educational Science) of the Universidad Nacional del Litoral (UNL) (National University of Litoral). The participation of Guerrero in the foundation of the Psychology Program took two main paths. On the one hand, as a professor of Psychology (theoretics) in 1954–1955 and on the other in the chair of General Psychology (1956) in the Psychotechnics Assistant Program (1954) and in the Psychology Program (1955–1956). During this period he published *Apuntes de Psicología* (Notes in Psychology) a blueprint mimeographed, used as basic study material. On the other hand he was an active member in the committees that gave birth to the first syllabuses and curricula for the university Psychology Program. In its first syllabus he co-worked with Erminda Benítez de Lambruschini (1900–1979). In the second one, 1956, with the professor Jaime Bernstein (1917–1988), he was appointed to reorganize the Psychology Program after the *coup d'état* in 1955 (Temporetti & Gerlero, 2017).

The *Notes in Psychology* were organized in two main areas of contents. In one, he developed a general overview of the place that psychology

holds among the other Human Sciences. In the other one, he gave industrious work to analyzing the fundamental problems of General Psychology. In this sense, he discussed the epistemological, ontological, and methodological foundations that gave origin to the so-called “old school of psychology” and suggested rethinking the theoretical tools from the Phenomenology of Husserl, existentialism of Heidegger, and the interpretations that the Frenches, Jean Paul Sartre (1905–1980) and Maurice Merleau Ponty (1908–1961) conducted. He also found inspiration in dialectic materialism, and he gave special attention to French Marxist psychologist Ignace Meyerson theory (1888–1983). He also incorporated relevant concepts of Gestalt psychologists as well as the contributions of the psychology of cognitive development of Henri Wallon (1879–1962) and Jean Piaget (1896–1980) (Temporetti & Gerlero, 2017).

Guerrero was part of the Generation of ‘25. Along with Carlos Astrada (1894–1970), Lidia Peradotto (1892–1951), Francisco Romero (1891–1962), Saúl Taborda (1885–1944), Vicente Fatone (1903–1962), Miguel Angel Virasoro (1900–1966) y Angel Vasallo (1902–1978). Many of them, under the guidance of Alejandro Korn (1860–1936) and the support of Ortega y Gasset (1883–1955), established new philosophical orientations based on phenomenology.

Guevara Caloca, Carlos Iván

Born on April 22, 1939, in Río Piedras,
Puerto Rico

María A. Battle
Carlos Albizu University, San Juan, Puerto Rico

Keywords

Puerto Rico · Clinical psychology ·
Psychotherapy · Family therapy

Carlos Iván Guevara was the only child of María Teresa Caloca Miguel, a school teacher, and Carlos Juan Guevara Ortiz, a Master Sergeant of the US Army. He lived in the downtown area of Río Piedras with his extended family: mother, father, grandmother, and uncle. His father died of a heart attack when he was around 11 years old. He studied at a private catholic school near his home and as soon as he graduated from high school entered the University of Puerto Rico, Río Piedras Campus (UPR-RP), to study medicine.

Carlos graduated Magna Cum Laude with a Bachelor in Science and a major in Pre-Medicine in 1959 from UPR-RP and entered the School of Medicine at UPR. Even though he finished his first year in Medical School fourth in his class of 55, he decided Medicine was not for him and left Medical School after the first year. Carlos decided to pursue studies in Psychology, a discipline that was more congruent with his personal and intellectual interests.

In 1961, Carlos Guevara married Ana Rita Torres Schermetti and moved to California to pursue graduate studies in Psychology at Stanford University. They have four children – Sergio, Pablo, Marite, and Marisa. He completed his Master's degree in Clinical Psychology in 1963 with the following thesis: *Autonomic Reactivity Process and Reactive Schizophrenia*. In 1965, he earned his Doctoral degree in Clinical Psychology. His dissertation was about *Paired Associative Learning of Normal Subjects and Schizophrenics, under conditions of High, Medium and Low Probability of Positive and*

Negative Reinforcements. He completed his internship program at Palo Alto Veterans Hospital.

In 1965, Dr. Carlos Guevara came back to Puerto Rico and became Assistant Professor at Dean of Students Office of UPR-RP, offering psychological services to students and occasionally teaching Psychology courses. The following year he became Associate Professor in a tenure track position at the Department of Psychology, Faculty of Social Sciences, at UPR-RP. Here he chaired for many years the Clinical Psychology Committee working along with Dr. Laura Leticia Herrans in the Master's degree program which had just been established in 1966. He helped develop the Doctoral degree program which was implanted in 1986. He participated in the Personnel Committee in charge of recruiting and evaluating faculty members. He also worked as a researcher at Social Sciences Research Center, UPR-RP, where he co-directed a study with Dr. Myrna Sesman about the effects of maternal attitudes and instructions on children's cognitive learning style.

In 1970, Dr. Carlos Guevara started his private practice offering psychological services to a varied population that included children and adults. He worked directly with federally funded community programs, like Head Start, and the Department of Public Instruction of the Commonwealth of Puerto Rico.

By 1978–1985, Dr. Carlos Guevara continued as Professor of Psychology at UPR-RP. During his classes he nurtured his students' interest in the study of Personality and Psychotherapy Theories, about Sullivan's (1892–1949) interpersonal approach, Freud (1856–1939), Jung (1875–1961), Piaget (1896–1980), Vygotsky (1896–1934), and Luria (1902–1977) as well as Saussure's (1857–1913) structuralism, without sidetracking humanistic Gestalt theories like Perls (1893–1970) and Rogers (1902–1987) and Glasser (1925–2013) and Lacan (1901–1981) case studies. Dr. Guevara also emphasized the importance of human communication theories and the mental research studies on schizophrenia. He introduced us to General Systems Theory, Family Therapy, Structure of Scientific Revolutions, Physics and Philosophy Family Therapy,

the New Paradigm, and its impact on Psychology. Dr. Carlos Guevara was a true scholar inspiring his students to study epistemological issues and promoting our inspiration to accomplish high goals because he instilled a sound development in critical thinking, clinical judgment, and true belief in one's own capabilities. The students blossomed under his mentorship and his skills as a supervisor of Psychotherapy and Family Therapy and his dissertation tutorial capacity.

In 1982, Dr. Carlos Guevara worked with other community-related institutions such as the Department of Drug Addiction, later renamed to Administration of Mental Health and Anti-Addiction Services, and the Office of Determination of Incapacity and Rehabilitation at the Department of Social Services.

In 1974, he published in collaboration with Myrna J. Sesman (born 1936) the results of their research work on the communications between mothers and children. In their study they compared communication between mothers and children in two groups: middle-class working mothers and low-income non-working mothers. They observed that their communication styles were different: Low-income mothers used monosyllabic language for disciplinary purposes with their children, whereas middle-class working mothers used explicatory and orientation language with their children.

In 1989, Dr. Carlos Guevara published his magistral contribution to Clinical Psychology and Psychotherapy, a book about the constitution of the human subject through language and communication. This book is a work of integration of Vygotsky, Luria, and Piaget theories with Lacan and Bateson (1904–1980) and communication theoretical contributions and its applications to Clinical Psychology and Psychotherapy.

Dr. Carlos Guevara has been a prolific lecturer on Child Development, Language, Learning, Cognitive Styles, and Maternal Communications. He has also offered lectures about Interpersonal Dynamics, Personality Assessment, and the Interpersonal Perspective in Psychotherapy. He is a specialist in language development and the Oedipus complex as studied throughout Freudian case studies and its meta-analysis. He delivered master

lectures at UPR-RP, Inter-American University, Puerto Rico Psychology Association, and other community organizations in Puerto Rico.

As a supervisor of individual psychotherapy and family therapy, Dr. Carlos Guevara trained his students in sound clinical judgment, hypotheses-based interventions on strategic and traditional models, as well as narrative, deconstructive, and neurolinguistic techniques. There were no limits to his interests and proficiency in regard to clinical work. In his work as mentor in theses and dissertations, his inspiration and belief in the potential of his graduate students promoted the utmost development of our professional capacity.

Dr. Carlos Guevara retired from his work as Professor of Psychology in 1999, after 34 years of hard work teaching, researching, supervising therapy practical experiences, supervising theses and dissertations, mentoring students, reviewing curricula, and offering lectures to the community, among other things.

Juan José Guevara Valdés was born in Havana. His father was a railroad worker and his mother was a teacher. He spent his childhood and youth in the Cerro neighborhood, together with his family. Despite coming from a humble family, his parents made every effort to provide him with a thorough education and a solid intellectual formation.

He attended high school at the *Instituto de La Habana* (Havana Institute) and in 1945 he entered the *Universidad de La Habana* (University of Havana) as a student of Law, Philosophy, and Letters. By that time, Guevara was already a member of the Socialist Youth and was identified with the progressive and revolutionary forces.

He also worked to be able to pay for his scholarships. For that reason, he dedicated himself to gastronomy, something to which he gave value, as any other career had for him. But in spite of working, he was always present in the student and political activities that took place at the University against the governments in power. He held leadership responsibilities in the *Federación Estudiantil Universitaria* (University Student Federation), was president of the *Comité Pro-República Española* (Pro-Spanish Republic Committee), and was a member of the *Comité Pro-independencia de Puerto Rico* (Pro-Independence Committee of Puerto Rico). He was arrested several times for his continuous revolutionary attitude, although this repression did not prevent him from being closely linked to the

Partido Popular Socialista (Popular Socialist Party) and other organizations.

A program in Psychology did not exist at that time, it was only a specialty that stemmed from Pedagogy, Philosophy, and Letters (Segura-Suárez, 2003), therefore Guevara took postgraduate courses and several courses after graduation related to Psychology. He attended courses at the Catholic University of Santo Tomás de Villanueva, where the program in Psychology first appeared in Cuba, but he later abandoned it because it did not respond to national interests. Psychology was what he was really passionate about, and within this, the Clinic was of special interest.

Through clinical practice, he became close to his friend René Vega Vega (1926–2019), a psychiatrist, whom he had known since high school, and there was a mutual interest in the study of children. And based on this common objective, Guevara founded, in 1954, together with other professionals such as Noemí Pérez Valdés (1926–2008) Roberto Fragas, Ricardo Cabanas (1921–1997), and René Vega Vega himself, the first Child Behavior Clinic in Cuba, under the name of *Orientación Psicológica Infantil* (Child Psychological Orientation) (OPI), where they performed psychological interventions with children, and where they worked until the triumph of the Revolution.

With the triumph of the Revolution, a series of radical changes took place in Cuban society. The University Reform was implemented in 1962, and in March of the same year, the School of Psychology was founded as a section of the Department of Natural Sciences at the University of Havana. Guevara had a very active participation in this process of organization of the school during its opening in 1962, in the role of founder, together with other professionals such as Alfonso Bernal del Riesgo (1902–1975) and Aníbal Rodríguez Álvarez (1917–2005). In addition, he was a member of the commission, designated by the Faculty professors, which studied and proposed modifications to achieve a curriculum at the height of the revolutionary times. He became director of this school in 1965 (Oliva, 2005).

In this period, he accompanied several researches oriented to the realization of social transformations proposed in the revolutionary program of social and cultural development in Cuba since 1965. He was an enthusiastic promoter of this type of applied scientific work, for the human and social value it expressed. In those early years, he summoned numerous students and professors to participate in the process of conducting research in the fields, mountains, and cities of Cuba, which meant a real school on practice.

Guevara, together with other professors of the school, contributed to formulating the idea of creating a Center in the school of Psychology that would integrate the various services provided, an idea that would materialize in the 1990s with the creation of the *Centro para la Orientación y Atención a la Población* (Center for Orientation and Attention to the Population).

His work at the School of Psychology, which later became the *Facultad de Psicología* (Faculty of Psychology) of the University of Havana, was truly tireless. In addition to occupying the position of director of that school, he was a renowned professor at the University of Havana for 30 years.

His most important contributions were in the fields of History of Philosophy, History of Psychology, and History of Cuban Thought. He also contributed to Clinical Psychology, Psychotherapy, Psychopathology, Psychological Diagnosis and Case Studies, Psychological Interview, Group Techniques, and Research Methodology in Social Sciences.

Those who had the privilege of receiving his classes or working as colleagues with him remember him as a man with a singular personality, a very deep thought, and an incessant interest in the study of the human mind. He was one of those men who offered proposals to his students, stimulated them with some action, with some idea, and waited attentively for their reaction, provoked them with his words, always seeking to inquire into the world of others, to understand them, because Guevara was a lover of Psychology.

But in addition to teaching and assuming important responsibilities within the Faculty of

Psychology, he held other positions outside the Faculty: he was President of *Tribunales de Categorías docentes y científicas de la Facultad de Ciencias de la Universidad de La Habana* (Tribunals of Teaching and Research Categories of the Faculty of Sciences of the University of Havana); he collaborated with the *Ministro de Educación* (Ministry of Education), as Head of the *Departamento de Psicología* (Department of Psychology), between 1968 and 1969, he was for a time Dean of the *Facultad de Humanidades de la Universidad de La Habana* (Faculty of Humanities of the University of Havana) and was a member of the Executive Committee of the International Union of Scientific Psychology between 1976 and 1980. He never dissociated himself from clinical psychology, which was for him a great love.

His development as a professional, as a scientist, and his interest in helping the advancement of Psychological Science in Cuba was remarkable. He participated in Psychology congresses at national and international level and with his enthusiastic attendance in the meetings between psychoanalysts and psychologists of Marxist orientation that were held in Cuba during the 1980s, in which he was a member of the International Coordinating Committee.

His interest to improve himself and mainly to support the evolution of Psychology as a program and as a science, to study the different theories that existed in other parts of the world and from which Cuban Psychology needed to be nourished in order to adopt or reject them critically, was materialized through postgraduate studies at the Institute of Psychology of the Academy of Sciences of the USSR in Moscow. He also represented Cuban Psychology in other parts of the world, being Visiting Professor at the *Escuela de Psicología de la Universidad Autónoma de Managua, Nicaragua* (School of Psychology of the Autonomous University of Managua, Nicaragua); Professor at the *Escuela de Psicología de la Universidad Nacional Autónoma de Guayaquil, Ecuador* (School of Psychology of the National Autonomous University of Guayaquil, Ecuador); Professor at the UNINCCA *Universidad de Bogotá*,

Colombia (UNINCCA University of Bogota, Colombia); Visiting Professor at the *Universidad Nacional Autónoma de México* (National Autonomous University of Mexico); Visiting Professor at the Institute of Psychology of the University of Humboldt, Berlin; and Visiting Professor at the American University of Washington, United States. In this way, he made possible the recognition of the work carried out by Cuban psychologists internationally.

Guevara had obtained the title of Dr. in Philosophy in 1962, but curiously, it was not until 1982 that he obtained the title of Doctor in Psychological Sciences at the University of Havana. In that same year, he published his article *El establecimiento y desarrollo de las ideas psicológicas en Cuba* (The Establishment and Development of Psychological Roots in Cuba), where he discusses the evolution of some psychological ideas in the country during the colonial period. Guevara was a continuator of these ideas, and this tendency towards philosophical and historical research made him in turn a follower of figures such as Alfonso Bernal del Riesgo, who like him was deeply rooted in the philosophical tradition and had a special interest in the development of Scientific Psychology based on Cuban roots. Guevara, according to many of those who knew him, was passionate about reading, culture, and the rescue of the past. Throughout his life, with his work, he carried out an intense search for the foundations of our psychology; in his discourse the names of Enrique José Varona (1849–1933), José de la Luz y Caballero (1800–1862), and Félix Varela (1788–1853) were always present, as important teachers and shapers of Cuban thought (Viguera-Moreno, 2018).

In the early 1990s, Juan Guevara received a request from Brazil to perform professional tasks. He traveled to Brazil with his wife and children. He continued his work at the *Universidade Federal de Santa Maria* (Federal University of Santa Maria), in Passo Fundo, Rio Grande do Sul, where he worked as thesis and dissertations director, in addition to conducting field research on social problems in the agricultural

communities of that area. It was there that he spent his last moments.

His work was always recognized, more as an organizer than for his scientific production, and his work and history received significant recognition throughout his life, for his dedication to psychology and the Cuban Revolution.

Vittorio Guidano was born in Rome in 1944. He graduated as a physician at the *Sapienza Università di Roma* (University of La Sapienza) in Rome in 1969. He specialized in neuropsychiatry at the *Università di Pisa* (University of Pisa) until 1972 and devoted an important part of his career to the development of psychotherapy. He died at an early age in Buenos Aires in 1999, leaving behind an intellectual work that has been a contribution to contemporary psychology. In his professional career, at least three theoretical and epistemological turns can be noticed, which finally leads to the creation of the Systematic Process Model and the Posrationalist Cognitive Therapy.

The first turn is related to Guidano's beginnings in psychotherapy in the late 1970s, when, amazed by the scarce clinical possibilities provided by both the medical model and psychoanalysis, he decided to explore the ideas and tools offered by behaviorism. In this context, Guidano and other professionals founded the *Società Italiana di Terapia Comportamentale* (Italian Society of Cognitive Therapy), officially inaugurating the development of scientific psychotherapy in Italy (Zagmutt, 2013). It is possible to identify then, in this first Guidano, a behaviorist aspect.

Despite having significant results with behavioral therapy, Guidano noticed that the therapeutic changes of his patients were not necessarily generated by the refined and organized techniques of behavioral therapy. Concerned about offering a quality clinical method, he began to study the so-called "mediational variables," incorporating cognitive processes in his psychotherapeutic work.

Thus, together with his friend and colleague Giovanni Liotti (1945–2018), he began a journey influenced by Popper (1902–1994), Lorenz (1903–1989), and Bowlby (1907–1990), among other authors (Molledo, 2011), laying the foundations of what would become in the future the postrationalist model, which was reflected in the work *Cognitive Processes and Emotional Disorders*, written together with Liotti and published in 1983 (Guidano & Liotti, 1983).

Guidano's second turn is already influenced by a basic epistemology that questions topics related to the existence of objective reality (Nardi & Molledo, 2009) and the explicit incorporation of affective aspects in the construction of identity, a theoretical substrate provided by John Bowlby's attachment theory (Guidano & Liotti, 1983).

After starting this work with Liotti, what seemed to be a promising alliance ends up dissolving, and both decide to go their separate ways. Guidano was interested in deepening the epistemological and ontological variants of the model he was already creating (Balbi, 2004). In 1987, he published his second work *Complexity of Self*, in which he deepened in the proposal of a scientific model for psychotherapy (Guidano, 1987).

In this context, he was invited in 1989 to Buenos Aires to offer what would be his first conference in these lands thanks to the coordinated work of therapeutic center known AIGLE and the *Centro de Terapia Cognitiva* (Cognitive Therapy Center) of that city (Korman, 2011). From this first visit, Guidano was a regular guest lecturer, and his importance was given not only by his theoretical knowledge but also by his suggestion of founding the *Asociación Argentina de Terapia Cognitiva* (Argentine Association of

Cognitive Therapy). This society was vital for developing this model in Argentina (Korman et al., 2015).

An odyssey began in 1989, not only in Argentina. Inspired by an incipient reading of North American cognitivism, a group of Chilean psychotherapists travels to the first meeting Guidano has in the Argentine capital. Delighted with the theoretical novelty presented by the Italian, they decided to invite him to Chile in 1990. Since then, Vittorio Guidano regularly visited South America, except for the years 1991, 1993, and 1998 in Argentina and 1993 and 1998 in Chile (Barahona-Moore, 2019; Barahona Moore et al 2022).

Among these unique visits, there is one, in particular, that took place in Chile in 1990. After his conference, Guidano met Humberto Maturana, which started a cordial conversation of knowledge exchange (Barahona-Moore, 2019). Another important milestone occurred in 1994 at the *IV Congreso Internacional de Constructivismo en Psicoterapia* (IV International Congress of Constructivism in Psychotherapy) held in Buenos Aires, which gathered important authorities of constructivism such as Humberto Maturana, Leslie Greenberg, Robert Neimyer, and Michael Mahoney.

The congress also served as a platform for the launching of the Spanish version of Guidano's last work, *The Self in Process*, initially launched in English in 1991, which is recognized as the author's definitive work, proposing a finished psychotherapeutic structure coherent with the theoretical postulates of the model (Guidano, 1994). Undoubtedly, Guidano's visits generated an impact in these lands, leaving an important legacy in both countries. At the beginning of the 1990s, three postrationalist therapy centers were created. In Chile, *the Sociedad de Terapia Cognitiva Posracionalista* (Society of Cognitive – Post-rationalist Therapy) and *the Instituto de Terapia Cognitiva Posracionalista* (Institute of Post-rationalist Cognitive Therapy), both founded by psychotherapists trained by Vittorio Guidano (Barahona-Moore, 2019).

In Argentina, Juan Balbi founded the *Centro de Terapia Posracionalista* (Center for Post-rationalist Therapy) known by the acronym *CETEPO*, which has offices in Chile, Brazil, Colombia, and Italy, with its current headquarters in Rome, Italy, Juan Balbi's country of residence. These centers exist to this day and provide clinical care and train psychologists who want to learn the theoretical and practical bases of the model and its respective updates. Postrationalism in the 1990s also had an important place in universities, particularly in Chile, where it was taught in clinical psychology courses at the *Universidad de Chile* (University of Chile), *Pontificia Universidad Católica de Valparaíso* (Pontifical Catholic University of Valparaíso), and the *Universidad Academia de Humanismo Cristiano* (University Academy of Christian Humanism), among others (Barahona-Moore, 2019).

Guidano died at the age of 55 in the city of Buenos Aires, leaving an unfinished body of knowledge in process. Well-known is his incipient development of the treatment for psychotic disorders, a clinical proposal that he left unfinished and that he could not capture in any formal document.

Clotilde Guillén was an Argentine educator, born to a Spanish hairdresser, Domingo Guillén, and a French-born housewife, Natalia de Guillén. She spent her childhood in the city of Buenos Aires, Argentina. In 1899, at nineteen, she graduated as a teacher from Buenos Aires Normal School of Teachers and devoted herself to teaching at elementary schools from 1900 to 1905. The following year, when she was 26 years old, she entered the Facultad de Filosofía y Letras de la Universidad de Buenos Aires (Faculty of Philosophy and Humanities of the University of Buenos Aires), which had recently annexed the Instituto Nacional del Profesorado Secundario (National High School Training Institute), to pursue higher education and obtain a diploma which would enable her to teach at a secondary and tertiary level. This school was the only one higher education institution in Argentina that accepted students from normal schools without the prerequisite of a degree at a high school.

In 1906, while she was working as a teacher and attending university, Guillén was sent to Europe by the Consejo Nacional de Educación (National Council of Education) to examine the structure and organization of elementary schools. Upon her return, she served as inspector of elementary schools in the Domestic Economy area, a position she held between 1906 and 1908. In her role as an inspector, she participated in curriculum

reform and wrote about this experience in various works published in *El Monitor de la Educación Común* [The Monitor of the Elementary Education], the official journal of the National Education Council. Some of these works were “La enseñanza de la costura en las escuelas elementales de Francia” [Teaching sewing in elementary schools in France] (Guillén, 1906a), “Bibliografía de Economía Doméstica” [Bibliography of Domestic Economy] (Guillén, 1907), “Algunas observaciones sobre el funcionamiento de las clases de cocina” [Some observations on how cooking classes work] (Guillén, 1906b), and *Instalación de una cocina escolar* [Installation of a school kitchen] (Guillén, 1908). On February 16, 1909, the Normal School of Teachers of Northern Barracas was founded under the executive order of the President José Figueroa Alcorta (1860–1931). This document also appointed Clotilde Guillén as the institution principal when she was 29 years old. The school effectively opened its doors on April 9 of that same year with a teaching staff selected and organized by Guillén herself, who was already an experienced teacher, inspector, and educator. At the same time, upon obtaining her higher education teaching diploma, she conducted the Pedagogy Seminar at the Facultad de Filosofía y Letras de la Universidad de Buenos Aires (Faculty of Philosophy and Humanities of the University of Buenos Aires) and worked as a middle/secondary school teacher of Psychology and Pedagogy.

On November 27, 1908, the Sociedad de Psicología (Society of Psychology) was created, and its first meeting was held in April 1909. This society, whose members were devoted to the teaching of psychology at universities and tertiary institutions, was presided by Dr Horacio Piñero (1869–1919), Dr José Ingenieros (1877–1925), and Dr Carlos Rodríguez Etchart (1866–1934), successively, and ceased to operate in 1913. Clotilde Guillén was the only woman within its forty founding members, all of them conspicuous representatives in the field of psychology at the time. She formed part of the Pedagogical Section (the Society also had sections of Normal, Abnormal and Social Psychology) (Ostrovsky,

2008). In 1910, she participated in the 17th International Congress of Americanists, which was held in Buenos Aires and Mexico.

By the end of the 1920s, when she was 48 years old, Guillén presided over the Education Section of the 3rd International Congress of Women in 1928, organized by the leading exponents of local feminism. Already in the 1920s, as an educator, she would stand out as one of the main representatives of the New School Movement in Argentina. She introduced this movement together with José Rezzano (1877–1960), her husband, also an educator and director of the journal of education *La Obra*. Introduced in Europe by Ovide Decroly (1871–1932) and Maria Montessori (1870–1952), among others, the New School Movement considers learners as intentional agents and not as mere recipients of knowledge (Carli, 2006). In contrast to traditional or “old school” teaching practices, it seeks to emphasize students’ autonomy and interests. This involves connecting schools with daily life and everyday knowledge. As Guillén herself argues: “Each notion, when acquired, stimulates bio psychic activity, elicits physiological responses (sensory, muscular and nervous) and mental responses (perception, association, abstraction, reasoning, etc.)” (Guillén, 1936, p. 44). Based on these principles, Clotilde Guillén continued in her position as school principal until her retirement in 1932, when she turned to writing and editorial work. In fact, in the 1940s, she undertook the management of the Pedagogical Culture Collection published by Kapeluz, a pioneering publishing house of works on psychology and pedagogy in Argentina. While working there, she wrote the prologue of books, such as *El niño que no aprende* [The Child Who Doesn’t Learn] by Spanish writer Emilio Mira y Lopez (1896–1964) (Mira y Lopez, 1943) and in 1942 she translated the *Tratado de Psicología* [A Treatise on Psychology] by George Dumas (1866–1946) from French into Spanish. Clotilde Guillén died in 1951 at the age of 71, having made important contributions to teaching, school management, and editorial management, also leaving her mark as the first female member of a professional society in Argentina.

Gutiérrez-Martínez realized his psychologist studios in the Facultad de Filosofía y Letras de la Universidad Nacional Autónoma de México (Faculty of Philosophy and Literature of the Autonomous National University of Mexico) (UNAM). He entered to the Psychology College in 1961 (Reyes, 2012). He obtained the licenciante with the thesis entitled: “Analysis of the technique and problems related to the construction in an attitude scale” in 1966.

Later he realized studies in Paris, France, in the Henri Pieron Institute, in the École des Hautes Etudes en Sciences Sociales (EHESS) of the Université de Paris. He obtained the diploma in industrial psychology and in social and environmental psychology. He earned doctoral degree in psychosociology in the Université de Paris-Sorbonne with the thesis: “*Structures et communications dans l’organisation industrielle*” in 1971.

He was general-secretary in the Facultad de Psicología (Faculty of Psychology) of the UNAM (he probably the youngest in the history of the Faculty), under the Dr. Luis Lara Tapia administration (1973–1977), the first director of

the Faculty. During that time equipment from the company Technicals Service was procured. This allowed the firsts investigations and publishments in experimental psychology in México (Ribes, 2016).

His greatest contribution in the investigation field is the conceptual development in the work stress and mental health. The SWS scale have translation to 18 languages and is also supported by the World Federation of Mental Health (WFMH). The stress is part contemporary life, so this contribution is very relevant. The last version was in 2017, coauthored by Priscila Guido (2017), one of his last thesis students.

Other important contributions are the mediation of the organizational diagnosis (DORREG) and the leadership scale (REG). He was actively involved in the training of professionals and scholars in the subjects. He collaborated with students, professionals, and scholars.

Gutiérrez Martínez spent his working life in the Facultad de Psicología (Faculty of Psychology) of the UNAM. He was representative of the UNAM in ALFA program of the European Economic Community. He managed and coordinated projects funded by UNAM, PFIZER laboratories, CONACyT (National Council for Science and Technology, México) in cooperation with the Instituto Mexicano del Seguro Social (Mexican Institute of Social Insurance) (IMSS).

He also participated as tutor in the doctorate in the Facultad de Contaduría y Administración (Accounting and Administration Faculty) at the UNAM, in the Consejo Nacional para la Enseñanza e Investigación en Psicología (National Council for the Teaching and Investigation in Psychology) (CNEIP) as an honorary member. He founded the Colegio Nacional de Psicólogos (National Board of Psychologists).

He contributed in other Universities, like the Universidad Autónoma de Zacatecas (Autonomous University of Zacatecas) (UAZ), Benemérita Universidad Autónoma de Puebla (Meritorious Autonomous University of Puebla) (BUAP), Universidad Autónoma del Estado de México (Autonomous University of Mexico State) (UAEM), and Universidad Autónoma de Querétaro (Autonomous University of Querétaro) (UAQ). At

the UAQ, he participated as an external tutor in the Doctorate in Health Science (Flores, 2017).

His job, training professional, was focused on a strong learning of theory and in the knowledge of the national and international field, always promoting the wellness of society and the human being. He was very interested in language learning, promoting the vanguard psychology. He showed much enthusiasm when talking about advances in the discipline.

Talking about his personal life, he was passionate about the classic music. Gutiérrez Martínez and his wife Dr. Silvia Macotela Flores (1947–2006) were benefactors of the UNAM Symphonic Orchestra (OFUNAM) and the UNAM Foundation. Gutiérrez Martínez promoted the Dr. Silvia Macotela Foundation (Flores, 2017) to improve the better quality of psychology education in México.

José Gutiérrez, or “Pepe” as he was best known by his friends and colleagues, studied at the traditional school Gimnasio Moderno (Modern Gymnasium) in Bogotá, from which he graduated in 1944. He then studied medicine at the Universidad Nacional de Colombia (National University of Colombia), graduating in 1950. He had his first experience in psychiatry during his two years in Paris (1948–1950). Afterward, he continued studies in psychiatry and completed his psychoanalytic training in Mexico (1955–1961). Gutiérrez married Magdalena Restrepo Ortega, a psychologist from the National University of Colombia (1954); they had three children: Marcela (1955), Alberto (1957), and Francisco (1958).

Gutiérrez began his psychoanalytic training very early with the first analysts of the psychoanalytic movement in Colombia, José Francisco Socarrás and Arturo Lizarazo Bohorquez (1917–1991). It was a time of disputes between

Socarrás and Lizarazo, which lead to the creation of two different psychoanalytical societies: the *Asociación Psicoanalítica Colombiana (Colombian Psychoanalytical Association)* and the *Sociedad Colombiana de Psicoanálisis (Colombian Psychoanalytical Society)*. Gutiérrez took distance from these disputes and led his own path, delving deeper in his own sociological and anthropological view of psychoanalysis.

Due to his left-wing political activism, Gutiérrez had to leave Colombia and go into exile after the tumultuous political ambiance because of the events of April 9, 1948, when the liberal presidential candidate Jorge Eliecer Gaitán (1903–1948) was murdered and which for many historians dates the beginning of a new wave of political violence known as “La violencia” (“The violence”). Gutiérrez was fond of the liberal guerrillas and rebel movements that rose against the conservative government of Laureano Gómez (1950–1951), and he wished to join them at his return to Colombia in 1950, but finally was not able to do so, because he had no direct contact with those groups (Hoyos, 2010).

Gutiérrez’s greatest influence was the German Jewish psychoanalyst Erich Fromm (1900–1980). He had read his book *Escape from Freedom* (1941) and had been deeply moved by it. Fromm had developed a specific line of humanistic psychoanalysis. In his work, he placed more interest in social transformations than in the Freudian drives. With his reading and practice of psychoanalysis, he elaborated a unique Freudian-Marxist position that deeply influenced many psychoanalysts of his time. As Fromm had to flee Europe due to Nazi prosecution, he established in Mexico, where he trained many psychoanalysts from the mid-1940s to the mid-1970s, in the city of Cuernavaca. It was there where José Gutiérrez flew with his family and carried out psychoanalytic training under Fromm’s tutorship. From 1955 to 1961, Gutiérrez was part of Fromm’s closest circle.

In 1961, he returned to Colombia and actively participated in the Movimiento Revolucionario Liberal (MRL) (Revolutionary Liberal Movement) founded by Alfonso Lopez Michelsen (1913–2007). The same year, he published *The*

Psychoanalytic Method of Eric Fromm (Gutiérrez, 1961). The book was not well received by his mentor and analyst, who discouraged him from carrying out its publication in English. It is not clear what aspects of the book were the ones that Fromm disapproved, but this dispute led to the breakup of their relationship.

Afterward, in 1974, when López Michelsen was elected president of Colombia (1974–1978), he designated José Gutiérrez as director of the Office of Indigenous Affairs, but the experience lasted only two weeks, being this the only public office that he held during his lifetime. Despite this, he continued to be a close friend of López Michelsen (Uribe Tobón, 2015).

During the following years, Gutiérrez continued his political action in the MRL. Nonetheless, he had to leave the country once again during the government of President Turbay Ayala (1978–1982) and exiled in France. He lived there with his family for four years, from 1979 to 1983. Afterward, he returned to Colombia, and during the government of President Belisario Betancur (1982–1986), he was part of the peace delegation of the government in the peace dialogues with the Fuerzas Armadas Revolucionarias de Colombia – Ejército del Pueblo (FARC-EP) (Revolutionary Armed Forces of Colombia – Army of the People), one of many attempts at peace negotiations that Colombian governments would establish in the years to come. In 1989, José Gutiérrez founded and assumed as the director of the left-wing political journal *Paso...Al Socialismo* (*Step...Towards Socialism*), which had a short life and a limited impact in Colombia's intellectual political arena.

According to Uribe Tobón (2015), Gutiérrez always stated that psychoanalysis was mainly a therapeutic treatment for the healing of neurosis and that the cure should be its main goal. He agreed with Freud that psychoanalysis was, at the same time, a theory of the individual, as well as of the group and of social psychology. The main issues which he found, reflected and learned from his mentor Erich Fromm, were present throughout his work: his concern for both individual and collective suffering; the issue of freedom and the subject's access and exercise of it; the

social and political concern of psychoanalysis; and the ethics of its theory, its method, and its practice.

One of José Gutiérrez's best-known work is his book *Gamín* (1972), product of an extensive research carried out in Bogotá. The term "gamín" refers to the children who live in the streets in conditions of economic scarcity; vulnerability; homelessness; and, in many cases, subject to exploitation. The research work was finished in the United States, in the Case Western Reserve University in Cleveland (Prensa, 2008), where he spent a short period in 1971. This work precedes other influential research in the topic in Colombia, such as that of anthropologist Virginia Gutiérrez de Pineda (1921–1999) (Gutiérrez de Pineda, 1978).

At the time of his death, Jose Gutiérrez had published twenty-six books. As Uribe Tobón (2015) mentions, his published works circled around the following topics: psychoanalytic theory and method, Greek thought and psychoanalysis, Colombian social psychology, and literature. Regarding the latter, José Gutiérrez authored three novels. He also published many articles throughout his life, which reflect his social and political concerns and his activism toward the defense of human rights through the *Comité Permanente de Derechos Humanos* (Permanent Committee on Human Rights), of which he was president until his death. Many of the books he published he did it himself through his own editorial called *Spiridon*. Gutiérrez also translated two books: Sechehaye's *Autobiography of a Schizophrenic Girl* (1958) and Piaget's book *La Formation du Symbole chez L'Enfant* (1945) which was published in Mexico by the *Fondo de Cultura Económica* in 1961.

As Uribe Tobón (2017), one of his disciples, states, José Gutiérrez was an "outstanding personality." He was an intellectual, with great interest in classic Greek literature. He was also a political fighter against the conservative governments of Colombia and against political oppression. Gutiérrez was a social combatant and activist of social rights and vigorously took part in popular struggles. Even though his works are not read or cited extensively in contemporary psychoanalytic

groups or circles, Gutiérrez continues to be today an exceptional figure of the compromise of psychoanalysts with the social and political causes of their time. In this sense, José Gutiérrez is a faithful inheritor of the spirit of the first and second generation of psychoanalysts that fervently linked their clinical practice and theory with social and political movements, not staying comfortably behind the closed doors of their consultation offices, but forcefully interacting with the outside world and being convinced that psychoanalysis was and is in the best capacity to produce social change.

Peru · Psychophysiology · Cultural psychology

Carlos Gutiérrez-Noriega was a psychiatrist graduated from the Universidad Nacional Mayor de San Marcos (National University of San Marcos, UNMSM, 1934). Attracted by psychoanalysis at the beginning of his career, he progressively turned his attention to other areas of knowledge and made valuable contributions in the study of pharmacology, hallucinogens, the effects of coca, and in the psychological analysis of literary characters.

Gutiérrez-Noriega was a professor of pharmacology at his *alma mater*. Between 1941 and 1942, he perfected his knowledge at the University of Chicago, United States. In 1942, together with Telémaco Battistini (1895–1960), he founded the *Revista de Medicina Experimental*

(Journal of Experimental Medicine), which continued until 10 years after his death.

One of the pioneers in the study of the effects of coca (Ayala-Pío & Murillo-Peña, 2018), he proposed that the generalization of the consumption of it in the Andean world occurred during the Spanish conquest in a process of economic collapse and intensification of work in the mines. Likewise, he highlighted the association between this consumption and the conditions of poverty and malnutrition.

Apart from his interest in psychopharmacology and coca consumption, Gutiérrez-Noriega was the author of studies on Miguel de Cervantes and psychology, magical thinking in ancient Peru, and on anthropological and psychiatric issues, which reveal his knowledge of painting, literature, and anthropological trends as well as the history of Peru prior to the arrival of the Spanish. Influenced by the ideas of the German psychiatrist Ernst Kretschmer (1888–1964), he also studied the cyclothymic temperament among Peruvian aborigines and ventured into the psychological analysis of the inhabitants of this part of the world, giving great importance to geographical aspects.

Author of numerous works, he died prematurely in a car accident in Pisa (Italy), spreading the rumor that he had actually been the victim of an attack caused by drug traffickers. After his death, a book of his on the relations between culture and personality appeared, which shows his knowledge of the currents of cultural anthropology of his time.

In the history of Peruvian psychiatry and psychology, Carlos Gutiérrez-Noriega is considered one of the most important scholars of the consumption of coca and the practice of *chaccheo*, chewing and holding its leaves in the mouth, very widespread in the Peruvian Andes, addressing them not only from the world of medicine but also taking into consideration the contribution of the social sciences (Valdivia-Ponce, 1964).

Guzmán Cervantes, Eugenia

Born in *Bogotá (Colombia)*, July 6, 1943

Patricia Montañés

Universidad Nacional de Colombia, Bogotá, Colombia

Keywords

Colombia · Neuropsychology · Neuroscience

To write the biography of Eugenia Guzmán is to write about the brain, a wonderful organ about which there are so many discoveries but is still so mysterious and unknown. It is to write about the emotion of learning and also the frustration of accepting that we still know very little. It is to write about the history of neuropsychology in Colombia and take a tour of the validation of this profession in our country. It is to recognize

the value of the contributions made by Eugenia and give an account of a nostalgic yesterday: neuropsychological evaluations performed calmly, acutely, exhaustively, elaborately, critically, and profoundly. Training in this complex and interesting field of convergence requires strong knowledge in basic and learning psychology, in psychometrics, in neurosciences, in cognitive and emotional functions, and in an integrated work in the context of a hospital and in an interdisciplinary team, vital elements that are scarce or not sufficiently developed in many programs.

Eugenia studied at the Liceo Francés (French Lyceum) of Bogotá, which, as she mentions, was the first trainer of her critical capacity. In the early years of the 1970s, she studied microbiology but soon saw that her interest was directed more toward the human sciences. For this reason, she entered the Universidad Nacional de Colombia (National University of Colombia) to study psychology. At that time, psychology was greatly influenced by psychoanalysis and did not solve many of her concerns and questions. She soon discovered that there was an area that linked well psychology and biology: neuropsychology. She went to the University of Iowa, the USA, and advanced a master's degree in neuropsychology under the direction of Arthur Benton (1909–2006). She graduated in 1975, and she was the first neuropsychologist in Colombia.

Upon her return, she adopted the difficult work of illustrating the importance of neuropsychology and validating our profession. Although brain lesions usually generate some type of cognitive or emotional dysfunction and the importance that these functions have in the human being is huge, the mental exam performed by the physician is minimal, and in the neurological study, the mental exam takes a few minutes. When there are impairments, this test requires a thorough evaluation, and it is the neuropsychologist who assumes it to investigate in depth the profile of alterations and their implications at a personal, family, academic, professional, and social level. That is, their concepts have, or should have, an enormous importance for the life and well-being of people. Eugenia Guzmán had a fundamental role in

transmitting this knowledge, in generating in physicians and psychologists concerns and questions about the brain and mind, in developing critical questioning skills and abilities, and in emphasizing responsibilities within the framework of ethics and knowledge of each profession.

In 1976, she was hired at the newly founded Instituto Neurológico de Colombia (Neurological Institute of Colombia) and started her hospital work in clinical neuropsychology. At this time, almost nobody in Colombia knew that neuropsychology existed; almost no one knew what neuropsychology was. This institute, which for many years served the purpose of assistance, teaching, and research about diseases of the nervous system, sadly had to close its doors in 1997. This was the first place where Eugenia participated in an extraordinary interdisciplinary team where her opinions were appreciated and respected for clinical and surgical decision-making. With her sharpness, humor, and deepness, she had a great influence on the doctors and psychologists who had the opportunity to learn by her side. Her work involved doing neuropsychological assessments and monitoring the cognitive status of people with brain damage. As it is still the case today, the standardization of tests was difficult due to the educational heterogeneity of the Colombian population, which goes from illiteracy to postdoctoral levels. According to the Survey of the National Administrative Department of Statistics (DANE) of 2018, the illiteracy rate is 5.24%, which is equivalent to 1,857,000 Colombians, and there are 16 doctors graduated per million inhabitants.

In 2020, it remains a relevant and worrying topic, despite recent efforts by different researchers to provide valid data for the Colombian population. The evaluations were clinical, based on deep knowledge and acute observation and analysis. She worked for 5 years at the Neurological Institute.

Eugenia was a professor at the Universidad de los Andes (University of Los Andes) between August of 1977 and November of 1979. After her departure from that university and the Neurological Institute, it was the enjoyment of the students of the National University of Colombia to have her as a teacher for more than two

decades, between 1980 and 2003. At National University, Eugenia felt privileged in assuming the training of students who, as she says, “have taught us much of what we know about Colombia, because it is multicultural, multiracial and multi-ideological” (Personal communication, January, 2020). She began teaching the courses of psychobiology and psychopathology. Her clarity and security, her irreverence, and her vivid sense of humor captivated the students. In 1986, she joined the Fundación Santa Fe (Santa Fe Foundation) in Bogotá, as a consulting member of the Department of Neurology, and for more than 20 years, patients, doctors, and students of this institution learned with her. Gradually, the profession of neuropsychology was recognized, although, unfortunately, it has not evolved to reach the quality she desired.

In 1983, she published *Neuropsicología (Neuropsychology)*, first text on the subject originally written in Spanish, for which she received the second prize of the National Academy of Medicine. It is a text that is still an important source, with a clear description of brain organization, brain lobes, interhemispheric asymmetries, the general consequences of brain lesions on behavior, and classic neuropsychological syndromes.

In 2001, she published the book *Los Mil Abrazos de Morfeo (A Thousand Hugs of Morpheus)*, in which she discusses issues around sleeping and dreaming, how sleep and its disorders are related to the pathology of bad sleep, and the theory of biological rhythms. She also analyzes data about these fascinating topics, which she had already elaborated in part in an article published in the *Revista Latinoamericana de Psicología (Latin American Journal of Psychology)* (Munévar et al., 1995). With her characteristic humor, Eugenia concludes the book in this way: “Definitely, to unravel the problem of consciousness in both humans and animals, it is necessary to know more about the unfathomable mystery of the abyss in which the one who is asleep moves through these worlds of God” (Guzman, 2001).

In 2004, she retired from the National University of Colombia and for some years remained linked to her hospital practice at the Santa Fe Foundation. She always remained active in her intellectual production. In 2013, she published two volumes of a text entitled *Neuropsicología (Neuropsychology)*, this time virtual books that constitute not only a clinical neuropsychology text but also of psychology, history, and philosophy. With impeccable clarity, examples, and illustrations and with multiple links, the books guide the reader to the exploration of various sources of information.

In 2016, she won the National Psychology Prize, for a lifetime dedicated to psychology. In 2017, she published her most recent book, *Soltando Amarras (Breaking Ties)*, which has had a great impact. She presents with great lucidity in the face of a taboo subject that most people prefer not to name: death. We are aware that, from the age of 65, the probability of illness and the certainty of death are very present. In this text, Eugenia points out that practitioners of medicine and psychiatry want everyone to live at all costs, regardless of living conditions, and she questions this reality. She explores the conditions of old age and disease in the light of medical technologies that can lengthen life but at a great cost and raises the question about rational suicide, the option of an end-of-life project that must be taken before having death hovering nearby. She elaborates the concept of suicide as a very complex case of decision-making, with a high emotional and moral burden. She addresses sad realities about the fear of loneliness, abandonment, disability, and loss of self. As she says at the end of her introduction, this book leads the readers to ask “how we want the last scene of the last act of our life to be” (Guzman, 2018).

In addition to her interest in psychology and neurosciences, Eugenia has also cultivated artistic skills as a ceramist and is an avid reader. She was a teacher who, with her works and thoughts, exerted an important influence on the development of neuropsychology in Colombia and who even today, with her latest book, this neuroscientist,

intellectually lucid and clear, continues to enliven the dilemmas of existence, exploring this time those about old age and the end of life.

Guzmán, Milagros

Born on November 28, 1928, in San Germán, Puerto Rico (PR)

Died on July 8, 2021 in Seminole, Florida, USA

Ivonne Moreno-Velázquez

University of Puerto Rico, San Juan, Puerto Rico

Keywords

Puerto Rico · Work/Organizational Psychology · Human Resources

Milagros Guzmán is the youngest of three children born to Alonso Guzmán, a constructor, and Josefa Ramírez, a homemaker who lived in a house in the rural area of El Cotto in San Germán, a town in the western coast of Puerto Rico. Her father worked at a family construction business. She studied in the parochial and private schools of her town and remembers spending her free time doing all sorts of sports (M. Guzmán, personal communication, June 27, 2020).

Milagros Guzmán studied at the Polytechnic Institute of Puerto Rico in San Germán, now Inter American University, and completed a bachelor's degree in Psychology with high honors in the late 1940s or early 1950s. Her first job was teaching at the same high school she had graduated from. In 1963, she obtained a Masters' at the Inter American University. She finished advanced studies in Industrial Psychology at the University of North Carolina in Chapel Hill. For her master's thesis, Milagros Guzmán worked with the *Holland Interest Inventory* (G. Cirino-Gerena, Personal communication, June 26, 2020). After her studies were finished, she completed professional internships in prestigious organizations in California, Illinois, Pennsylvania, and New York (Moreno-Velázquez et al., 2006).

Milagros Guzmán had an extensive and distinguished career as an industrial and organizational psychologist. She has lectured and participated in

radio and television programs and written various articles in the press and in professional journals. During the 1960s she worked as a development consultant both in Puerto Rico and abroad. She held a position in the human resources management of the Port Authority of New York and offered consulting services in Venezuela, Santo Domingo, Guatemala, and El Salvador. She also taught graduate courses in Public Administration at the University of Puerto Rico, Río Piedras (UPR_PR), from 1970 to 1972. In 1973, she was appointed by the Governor of Puerto Rico, Rafael Hernández Colón, to lead the Public Service Personnel System (Moreno-Velázquez et al., 2006). From this position she led the development and approval of Law # 5 of October 1975 on Personnel Administration through which OCAP (Central Office for Personnel Administration) later known as the Office of Human Resources of the Commonwealth (ORHELA) was created, which today is the Office for Training and Advice on Labor Matters and Human Resources Administration (OCALARH). This law stressed the principle of Merit in the hiring and evaluation of personnel for public service. It also established the importance of productivity. According to Alex W. Maldonado in 1976, in the newspaper *El Mundo [The World]*, “Milagros Guzmán was a heroine in defense of the merit system” (p. 91, as cited by Colón González, 2007–2008).

In 1977 she founded the Institute for Productivity (INPRO), a non-profit organization, from where she offered a wide variety of training programs and conducted research, as a contribution to the progress of companies in the private and public sector, and to the development of human resources. Since its foundation, INPRO served nearly 900 public and private companies in services, manufacturing, commerce, banking, education, and non-profit organizations in Puerto Rico and trained over 85,000 people including executives, managers, supervisors, employees, operators, and clerks at all levels and categories.

Milagros Guzmán was a member of the Board of Directors of Puerto Rico 2000, a group for the

transformation of Puerto Rico, and the Board of Trustees of the Center for Advanced Studies of Puerto Rico and the Caribbean, a private non-profit graduate institution. However, her influence and recognition have reached beyond Puerto Rico, to the United States and Spanish-speaking countries. In 1997, she received the Lifetime Achievement Award from the Society for Human Resource Management (SHRM) of the United States. She was recognized as a Fellow of the World Academy of Productivity Science, and her name appears in the United Who’s Who of Executives and Professionals.

Milagros Guzmán was editor and author of several books and was a member of various professional organizations, including the American Psychological Association; Puerto Rico Association of Psychology; Society for Industrial and Organizational Psychology; World Confederation of Productivity Science; Alumni Association Inter-American University; Society for Human Resource Management (SHRM); and the American Society for Training and Development (ASTD).

psychology

After obtaining a doctoral degree in psychology at the University of Heidelberg (1923), Hans Hahn worked as a psychologist in Germany until 1933. Emigrated with his wife after the rise of Hitler, he worked for a time in Belgium at the *Institute des Hautes Études* (Institute of Higher Studies, Brussels).

Thanks to the mediation of Isidore Poiry (1868–1954), Hahn obtained asylum and worked as an experimental psychologist in Peru (South America) since 1937, first in Trujillo, an important city on the Peruvian coast north of Lima, being the first director of the Instituto de Psicología Experimental (Institute of Experimental Psychology) and professor at the Universidad Nacional de Trujillo (National University of Trujillo), which acquired

essential equipment for the corresponding course and laboratory, thus seeking to complement the training of pedagogy students. This laboratory was the first outside the Peruvian capital, Lima. From 1940 to 1950, he was a professor of applied psychology at the Facultad de Ciencias Económicas (Faculty of Economic Sciences) of the old Universidad Nacional Mayor de San Marcos (National University of San Marcos, UNMSM) in Lima. There he also collaborated with the Instituto de Biología Andina (Institute of Andean Biology) studying people from high altitude areas (Hahn, 1942). At the same time, he developed personnel selection and accident prevention procedures for the Peruvian armed forces and industry.

In 1950, he moved to the United States of America, where he was professor of psychology and head of the department of psychology at Transylvania College in Lexington, Kentucky. Likewise, he directed the Human Behavior Laboratory at that institution and conducted research on accident prevention, empathy, frustration, and psychotechnical tests. His accident prevention test was used by the police and the army in Kentucky (Marblestone, 2014).

Although today he is a little-remembered figure in the history of Peruvian psychology, he must be mentioned for two reasons: for having been one of the first psychologists (along with Walter Blumenfeld, another German emigrant like him, to propose an experimental psychology in Peru, and for his participation in the Institute of Andean Biology, and his work on the effect of altitude on psychological processes (Orbegoso, 2016).

Harari, Roberto Saúl

Born *in Buenos Aires, Argentina, June 26, 1943*

Died *in Buenos Aires, Argentina, June 30, 2009*

Leandro Ferrero
Universidad Nacional de Córdoba, Córdoba,
Argentina

Keywords

Argentina · Psychoanalysis · Lacanism ·
Mayéutica · Psychoanalytic institutions

Psychoanalyst, Ph. D. in psychology, and essayist, Harari acquired a place of relevance in the history of Argentine psychology for his role in the organization of Lacanian psychoanalysis in the region, and its prolific written work that made him a figure of reference within the field from the 1970s and onward. His participation in the Asociación de Psicólogos de Buenos Aires (Psychologists Association of Buenos Aires) and the direction of the *Revista Argentina de Psicología* (*Argentine Journal of Psychology*), during the late 1960s, can also be highlighted.

He graduated in psychology at Universidad de Buenos Aires (University of Buenos Aires) in 1965, and he obtained his PhD in psychology in 1985 at Universidad de El Salvador (University of El Salvador). In the beginning, he became one of the representatives of the second generation of Argentine psychologists, characterized by the severe critics toward the Argentine Psychoanalytic Association (APA), aiming specifically to the requirement, appointed by the APA, to be a member of the institution to become a psychoanalyst (Carpintero & Vainer, 2009).

From 1969 to 1971, he was the president of the Association of Psychologists of Buenos Aires, and during his administration, the association got deeply involved in the legal claims of the psychologists profession, and the fight for the legal claims of psychology in Argentina deepened. Also, the *Revista Argentina de Psicología* (*Argentine Journal of Psychology*) (RAP) began to be published. This publication, in its first issues, was characterized by a strong critical trend revealing the struggles in the professional field of psychologists (Carpintero & Vainer, 2004, 2009).

In 1971, he became the director of the RAP for 2 years. Among his main contributions during this period, he opposed the point of view of José Bleger – largely extended in the Argentine psychological field, who claimed that psychologists should be “agents of change.” In opposition to this perspective, Harari – based on the works of Althusser (1918–1990) and Lacan (1901–1981) – tried to demonstrate that psychoanalysis was not a profession with a specific field of intervention but a science. From his point of view, he argued that psychoanalysis was the theory that would empower psychologists to operate in the various situations they could face, thus taking distance from the idea of “change” as the main goal of psychoanalytic practice (Plotkin & Visacovsky, 2008).

In this manner, he promoted the editions of books such as *El rol del psicólogo* (*The Role of Psychologists*) (Bricht et al., 1973), and *El psicólogo y su profesión* (*The Psychologist and his Profession*) (Litvinoff & de Gomel, 1975), in which he also wrote the prologue. He was the author of *Teoría y Técnica de los abordajes*

marginales (Theory and Technique of Marginal Approaches) (Harari, 1974), and *El objeto de la operación del psicólogo* (The object of the Operation of the Psychologist) (Harari, 1976), which concluded with a brief comment by Louis Althusser (Carpintero & Vainer, 2004).

It is from this approach to Lacan and Althusser – the last author with whom he maintained a large correspondence and with whom he met on a couple of occasions in Paris between 1975 and 1980 – that he became, during the 1970s and onward, an undisputed protagonist of the Lacanian psychoanalytic field. In the first stage of its production, he emphasized the re-reading of Freud proposed by Lacan, supported by the German and French translations of Freud. Then he advanced toward his conception of the Realenguaje (“*Realanguage*”), to arrive in his last book: *El sujeto descentrado* (The Decentralized Subject), to present psychoanalysis to those who are not familiar with it (Harari, 2008). He articulated the direction of the cure with the social insertion of the practice, thus continuing the necessary teachings to the refundation of what he stated as “*nuestro*” (our) psychoanalysis (Feinsilber, 2009).

In 1977, he was a founding member and then president of *Mayéutica-institución psicoanalítica*, in Buenos Aires, which is, chronologically, the second Lacanian institution in the international psychoanalytic scenario. In addition to being an Analyst Member (MA), he conducted an annual seminar there from 1981 to 2008 (Rodríguez, 2012; Feinsilber, 2009; Carpintero & Vainer, 2009).

His participation and collaboration in the expansion of Lacanian psychoanalysis at international and multi-institutional level was remarkable. In 1983, he founded and coordinated the Psychoanalytic Extension Center of the San Martín Cultural Center under the Ministry of Culture of the City of Buenos Aires, being the first group of representatives of psychoanalytic institutions in the region, after the dissolution of the School founded by Lacan in Paris. Pursuing that ideology, that conception, and that way of gathering professionals, in 1985 he collaborated as a representative of his institution in the cofoundation of

the *Reunión Lacanoamericana de Psicoanálisis* (Lacanoamerican Meeting of Psychoanalysis), and in 1998, in Barcelona, he founded *Convergencia, Movimiento Lacaniano por el Psicoanálisis Freudiano* (Convergence, Lacanian Movement for Freudian Psychoanalysis), a multi-institutional network of an international character (Cueto, 2004; Feinsilber, 2009; Rodríguez, 2012; Russo, 2009).

He also lectured as a visiting professor at the University of Provence, in France, in addition to teaching courses, conferences, and seminars in different cities in Argentina, America, and Europe, periodically giving classes of psychoanalysis in Brazil, in the USA, and in Australia (Feinsilber, 2009; Cueto, 2004). He also participated as a member of the International Federation for Psychoanalytic Education and the Society for Chaos Theory in Psychology and Life Sciences (Rodríguez, 2012).

In relation to his lengthy essay production, the publication of 24 books translated into French, English, and Portuguese stands out, for which he obtained the following distinctions: *Faja de Honor en el género ensayo* (Honor in the Essay Genre), of the Argentine Society of Writers; *Premio Único Municipal a Ensayo Inédito* (Single Municipal Award for Unpublished Essay), from the Government of the City of Buenos Aires; and Second National Prize for Philosophy and Psychology, granted by the Ministry of Culture of the Argentine Republic (Rodríguez, 2012).

He also published more than 290 articles in the specialized magazines of main circulation, in newspapers, and on websites of Argentina, Uruguay, Brazil, Venezuela, Colombia, Chile, Mexico, the USA, Spain, England, Australia, France, and Turkey (Rodríguez, 2012).

In relation to editorial work, from 1986 to 2008 he directed the *Freud* \diamond *Lacan* collection, of Nueva Visión Editions, which published more than 120 titles and integrated the Scientific Committee of the French journals *La clinique lacanienne*, *Figures de la Psychanalyse*, *Analyse Freudienne Presse*, *Cliniques méditerranéennes*, and *Langage et inconscient* (Rodríguez, 2012; Cueto, 2004).

Henry de Crescioni, Lavinia Catalina

Born on November 25, 1920, in Cabo Rojo, Puerto Rico (PR)

Died on December 22, 2013, in San Juan, PR

Nydia Lucca-Irizarry

University of Puerto Rico, Río Piedras, San Juan, Puerto Rico

Keywords

Puerto Rico · Educational Psychology · College administration

Lavinia Catalina Henry was born in Cabo Rojo, a coastal tourist attraction town in the Southwest of Puerto Rico. Born to Mrs. Antonia Ramírez, 25 at the time of birth, and Mr. Luis Henry, 53 years old, she was the oldest of two siblings. His brother Benjamín was 2 years younger. At the birth time, her mother was a housewife and her father a carpenter. From the paternal side, she was blood-related to the most prominent Puerto Rican revolutionary figure, physician Ramón Emeterio Betances (1827–1898).

Lavinia's mother became a schoolteacher under the US flag dominion when Lavinia was young, which means that by the time, they were considered a well-to-do household. She grew in a bilingual (Spanish-English) environment in an adequate dwelling (according to the 1940 US Census house value) in urban Cabo Rojo. Lavinia's father died when she was 15 years old.

Hers was an extended family in which an old aunt to Lavinia's mother, Mrs. Carmen M. Padilla, and a nephew lived in the house with the family, in addition to a very young maidservant.

Lavinia attended the University of Puerto Rico, Rio Piedras campus (UPR-RP), and obtained her BS degree in Home Economics (1942) as customarily for well-to-do girls. She married immediately after graduation, on the 4th of July, to Mr. Héctor Crescioni (1922–1994). Afterward, she worked as a secondary school teacher and supervisor in her study field for 9 years. Eventually, in 1952, she obtained her MA degree from New York University, majoring in Educational Psychology. Then, in 1968, she completed a Doctorate in Education (EdD) from Florida State University, with a specialty in Research and Testing. Her doctoral dissertation, *A study of praise and reproof: Their effects on motivational structure and learning* (Crescioni, 1968), examined if verbal praise and verbal reproof have predictable effects in the learning process and the role of motivational state of the learners in changes brought about in performance by the application of praise and reproof.

Lavinia Henry de Crescioni held assistant and associate professor positions at the College of Education, UPR-RP, in the 1950s and 1960s, where she also served as acting director of the Guidance Office. At the same time, she maintained her private practice as a consulting psychologist with the Puerto Rico Department of Public Instruction, the Advisory Committee for the Development of Public Service Personnel of the Commonwealth of Puerto Rico, and federal agencies such as the Social Security Administration's Bureau of Hearings and Appeals and the Head Start Program.

In her professional career as a psychologist, she demonstrated a strong leadership regarding issues affecting the profession in the Island. She figured among the first members of the *Asociación de Psicología de Puerto Rico* (APPR, Association of Psychology of Puerto Rico). Worth mentioning are the multiple roles that she assumed as treasurer (1959–1960), secretary (1963–1965), and eventually president of APPR in 1969. Under her leadership, a draft law to regulate the practice of

Psychology in Puerto Rico was prepared (Rivera and Maldonado, 2000). The document contemplated that different specialties within the field were included in the regulatory law. She was also a member and president of the Board of the Puerto Rico Psychological Institute, the first private postgraduate school of psychology established in the island in 1966 by Carlos Albizu-Miranda and Norman Matlin (later *Centro Caribeño de Estudios Postgraduados*, Carlos Albizu University, since 2000).

After years of service at the state university (UPR-RP), in 1966, Dr. Crescioni joined the Interamerican University in Puerto Rico. Her leadership, vast knowledge, and managerial skills found a fertile soil in the administrative realm. Between 1966 and 1969, she directed the Upward Bound and Early Childhood Education Programs at the institution. Three years later, she was appointed Dean of the Regional Colleges and Extensions. She was named vice president and executive dean of the Regional College Instructional Unit in 1972. A year later, she was appointed vice president and executive dean of Metropolitan Campus, achieving high standards in academic and administrative operations. In 1975, she was appointed vice president for Academic Affairs for the Interamerican University system. In an all-men traditional higher education institution, she was one of the few women to hold a top administrative position in a very successful manner, at times in which women's place was considered to be the classroom. Her name was included in the *American Association of Colleges for Teacher Education Yearbook* during the 1970s, as an official representative of her institution.

Records show that she was an ardent defender of the rights of students with certain limitations and coming from poverty backgrounds to attend college and accomplish academic degrees as a means to improve personally and overcome difficulties with dignity. At the administrative level, she sought to provide all sorts of support to the students, from material devices, an enriched extra-curricular offer, to high-quality student counseling services. From her top administrative position, she promoted the concept of a "service university"

oriented toward the preparation of students for service, a university that also serves students taking good care of their needs. She advocated for a special type of instruction for the poor in higher education; an education that prepares them to join the labor force while they participate in a liberal arts curriculum (Middle States, 1975). She was described by a former colleague from Interamerican University as a “feminist . . . a very brave lady. . . worthy of respect and admiration” (M.A. Ortiz, personal communication, September 5, 2020) in the male-dominated society of the 1960s and 1970s in Puerto Rico.

In terms of research, she was interested in examining the intersection of psychological knowledge and educational practices in the classroom to improve the quality of education of both children and college student, the perception of self among Puerto Rican children and adolescents, the relationship between personality conflicts and dropping out among college students, and the role and responsibilities of university professors in the teachers’ preparatory programs. In 1959, she was a regular collaborator to one of the most important newspapers in the Island (*El Mundo*) responsible for a weekly column on the psychosocio-emotional aspects of adolescence.

She had a daughter (Gladys Crescioni, 1943–1998), journalist and writer, and a granddaughter (Xavira Neggers, journalist), both deceased.

Mexico City, Mexico

Keywords

Mexico · Neuropsychology · Master’s degree in neuropsychology · Neuropsychological evaluation

Julieta obtained her school training in Mexico City, from basic education to postgraduate. She

was a student at the French College of San Cosme and at Secondary School # 2 “Ana María Berlanga.” She entered the Escuela Nacional Preparatoria #1 “San Ildefonso” (National Preparatory School) of the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM), and later the Faculty of Philosophy and Letters of the same university, in the then “Colegio de Psicología” (in 1973 it became the Facultad de Psicología (Faculty of Psychology) independent of the Facultad de Filosofía y Letras (Faculty of Philosophy and Letters). In 1965 she graduated as a psychologist with the thesis: “The intellectual sphere of the Grace Arthur and Alicia Descoedres tests in a group of the mentally handicapped with language disorders” (Heres-Pulido 1965). This thesis reflects her interests and her vision of psychology that she would develop throughout his professional life. From 1980 to 1982, she completed a postgraduate specialization in language pathology at the School of Language Pathology of the Hospital de la Santa Cruz y San Pablo in the city of Barcelona. In 2001, she obtained a doctorate in Health Psychology at the Centro Universitario de Ciencias de la Salud de la Universidad de Guadalajara (University Center for Health Sciences of the University of Guadalajara) (UG).

Julieta began as a psychologist in a medical environment in which she had to propose forms of care that on many occasions had no precedent in psychology. After graduating as a psychologist, she worked in ward 501-A of Plastic and Reconstructive Surgery of the Hospital General de México (General Hospital of Mexico), which was directed by Dr. Fernando Ortiz Monasterio (1923–2012), treating disorders of the body schema in burned or deformed people. In addition to carrying out tests on people who required or were requesting plastic surgery who had this condition as a background; one of her care goals was to avoid possible failures or personality breaks. At this same institution, she organized a group to teach the techniques of early multisensory stimulation of children with craniofacial malformations.

The most important contribution of Julieta Heres Pulido to psychology in Mexico was, without a doubt, having started the first postgraduate program in neuropsychology at the then Escuela Nacional de Estudios Profesionales Zaragoza (National School of Professional Studies Zaragoza) (ENEP-Zaragoza) of UNAM that in 1993 became a Faculty of Higher Studies (FES). The curriculum is 2 years and a bachelor's degree in psychology is required for admission. The program began in August 1989. In those years neuropsychology was almost unknown and was not understood as a specialty of psychology (Ostrosky-Solís and Matute-Durán 2009). This study plan was reformulated in 2000 and is called Residency in Clinical Neuropsychology as part of the Master and Doctorate Program offered by UNAM. It is taught in the three locations that offer a psychology degree at this institution: the Faculty of Psychology, the FES-Zaragoza, and the FES-Iztacala. In 1998, together with other prominent professionals, she founded the Mexican Association of Neuropsychology, A.C., which holds a national congress every 2 years.

Julieta was always interested in the development of neuropsychological assessment instruments that went beyond psychometric analysis and that allowed a qualitative assessment and as close as possible to activities of daily living. This led her to develop a battery of tests for people with little or no schooling that was applied in the Unidad de Investigación en Neuropsicología (Research Unit in Neuropsychology) of the Instituto Nacional de Neurología y Neurocirugía (National Institute of Neurology and Neurosurgery) (INNyN). The test called Exploración Neuropsicológica Básica (*Basic Neuropsychological Examination*) (EXNP) was published by the then ENEP-Zaragoza and norms were obtained by age and schooling (Heres-Pulido and Villa-Rodríguez 1989). With it, the main neuropsychological functions are evaluated, such as attention in three modalities, auditory, visual, and tactile, orientation in the three spheres, and verbal and visual memory. From language are explored: fluency, informative content, rhythm, melody, repetition, naming, reading, and writing

comprehension (from the knowledge of the letters to the understanding of sentences according to the level of schooling). Gnosias and praxias also adapted to the level of schooling. Formation of concepts with calculating objects that the evaluated person must classify into three categories: Abstraction is evaluated by the interpretation of sayings; problem solving is explored by solving specific problems and calculating with situations involving money management. The test was completed with the *Token Test* and with the memory copy and reproduction of the *Rey-Osterrieth complex Figure*. She also developed a *non-test* called *the feather duster and the eraser test*. The idea of the test is that there was no test, the deconstruction of a neuropsychological test. So having a feather duster, or an eraser depending on the context, can be explored from the denomination to the tactile gnosias, going through praxias, short- and long-term memory, narrative language, judgment, and reasoning. The test was simply an exploration guide, but it involved mastering neuropsychological theory (Villa-Rodríguez 2017).

Her contributions to the training of human resources in Psychology and Neuropsychology were recognized by the Consorcio de Universidades Mexicanas (Consortium of Mexican Universities) (CUMEX) by giving her name to the Chair of Psychology. The Chair of Psychology “Dra. Julieta Heres Pulido” has been taught since 2004 at the member universities of the consortium, which take turns at the headquarters (Castañeda 2019).

Hernández-Peón studied elementary, middle, and high school in the city of Merida, Yucatan. In 1941 he finished his high school studies in the areas of biological and physicochemical sciences; he then received professional education in medical surgery at the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM), where he finished his studies in 1949. At the end of his professional training and 2 years before getting his degree, Hernández-Peón carried out several studies on the mechanisms of renal filtration and renal

vascular bypass (Hernández-Orozco 2011). Hence, in 1955, he received an invitation to collaborate with a monograph on body fluids in John Fulton's book: *Textbook of Physiology* and later in a review by Theodore C. Ruch, in 1960, entitled: *Fulton's Medical Physiology and Biophysics* (Morgane, 1970).

In 1952 he received a scholarship from the US Public Health to do a research stay with Horace W. Magoun (1907–1991) in the Department of Anatomy and Physiology at the University of California (Sterman 1968). In 1950, Magoun had established a laboratory with John D. French at the Long Beach Veterans Administration Hospital, recognized as one of the leading international laboratories in the study of the nervous system. During this stay, Hernandez-Peón develops a great interest in the study of brain functions, which determined the scientific concerns that he would develop throughout his life. From 1954 to 1955, he was visiting researcher in the Department of Surgery at the School of Medicine of the University of Oregon (Colotla 2016). In 1954 he returned to the University of California, thanks to a Guggenheim grant. Afterward, he worked at the Graduate School of UNAM until 1958, the year in which he accepted the position of research professor and director of the Experimental Psychiatric Center of the Universidad de Chile (University of Chile), and professor of physiology and dean of the Institute of Physiology of the Universidad de Concepción (University de Concepción) (Drucker-Colín & Rojas-Ramírez, 2005). In 1959, he returned for a brief period to the UNAM Physiology Department, and later, in 1960, he founded, with Manuel Velasco Suárez, the Brain Research Unit, the precursor of the Instituto Nacional de Neurología (National Institute of Neurology), and became its first director. In the following years, this Unit acquired national and international recognition and received the visit of foreign researchers such as Paul Bach and Rita, and Peter J. Morgane (Morgane, 1970; Vicencio-Muñoz, 2018). However, in 1964, his laboratory closed due to “the maneuvers of his scientific and political enemies” (Morgane, 1970). However, despite the large number of job offers he had in other countries, he decided to stay

in Mexico. He pawned his house, located on Moras Street in the Colonia del Valle, and founded the Instituto de Investigaciones Cerebrales A.C. (Brain Research Institute). In subsequent years until his death, and thanks to his remarkable productivity and international recognition, his research received funding from US Health Institutions (Drucker-Colín & Rojas-Ramírez, 2005). At the time of his death, in Mexico, Hernández-Peón was widely recognized as one of the most influential researchers in the area of neurophysiology. Internationally he was considered a world leader in the study of the neurophysiological mechanisms of sleep.

Hernández-Peón's works focused on the study of arousal, orientation responses, attention, and habituation, as well as their relationship with sleep and daydreams, awareness, and alterations in mental functioning (Morgane, 1970; Drucker-Colín & Rojas-Ramírez, 2005).

In collaboration with French and Livingston (French et al., 1955; Hernández-Peón 1963), he studied through evoked potentials in monkeys, the cortico-fugal projections to the cerebral cortex. He found that these projections come from different areas of the cortex and meet in the reticular formation of the brain stem. Based on the existing evidence, they proposed that the reticular formation mediated the ascending mechanisms of arousal derived from external stimulation and was also affected by descending impulses of a pathway he had recently described (Hernandez-Peón et al. 1960). Thus, they suggested reticular formation contains facilitating and inhibiting nuclei responsible for essential aspects of consciousness such as voluntary arousal, directed attention, and surveillance.

In a later work, in collaboration with Hagbarth (Hernandez-Peón & Hagbarth, 1955), Hernández-Peón demonstrated that postsynaptic afferent pathways activated by sensory stimulation could be inhibited in the spinal cord by excitation of the ascending activating system of the brain stem. It was the first demonstration that the reticular system is capable of inhibiting the transmission of sensory messages within the nervous system to the first synapse of the pathway. Later, in works carried out with Michel Valentin Marcel Jouvét

(1925–2017), he observed that the activation of reticular formation exerts a downward influence, through inhibitory centrifugal fibers, on the sensory pathways up to the first synapse. In one of these experiments, using cats as subjects, recording evoked potentials to an auditory stimulus in the dorsal cochlear nucleus, during alert-relaxed or sustained attention conditions. The results showed that the evoked potentials had a stable magnitude when the cats were on alert-relaxed. However, when they were exposed to a mouse, and they looked at it closely, a significant reduction in evoked potentials was observed. Consistently, when the mouse was removed from the cat's view, the potentials returned to their original level. These results led Hernández-Peón to conclude that distraction toward a stimulus must be accompanied by sensory inhibition, while attention must be followed by selective sensory facilitation (Hernández-Peón et al., 1956). After some experiments, he proposed a hypothesis about sensory regulation, attention, and habituation, suggesting that the reticular formation is like a “high command,” which receives and controls external and internal information, and the brain in itself. At a given moment, it filters, amplifies, and integrates the signals it receives and prevents the overactivation of the delicate sensory integration mechanisms (Drucker-Colín 1999).

Finally, in 1965, based on the results of various experiments, he proposed a hypnogenic system of cholinergic nature. Their studies showed sleep induction in cats, after localized administration of acetylcholine, eserine, and carbamylcholine. It suggested that activation by cholinergic mechanisms of ascending and descending projections produced the inhibition of reticular formation, and therefore released the activity of the neocortex, producing rapidly the rapid eye movements sleep (Drucker-Colín & Merchant-Nancy, 1995).

It is of such relevance the contributions of Raul Hernandez-Peón that his publications appear in Web of Science with 1628 citations, some of which follow his death. Likewise, the Facultad de Psicología (Faculty of Psychology), UNAM, established a unique chair with the name of Raúl Hernandez-Peón on May 21, 2015.

Herrans-Pérez, Laura Leticia

Born on June 16, 1935, at Vega Baja, Puerto Rico

Died on March 23, 2020, at San Juan, Puerto Rico

Juana Myrtea Rodríguez González
University of Puerto Rico, San Juan, Puerto Rico

Keywords

Puerto Rico · Educational Psychology · Tests and measurements

Laura Leticia Herrans-Pérez is the first of three children born to Juan Bautista Herrans López, comptroller at the *Central San Vicente*, first sugarcane refinery established in PR in the nineteenth century, and María Teresa Pérez González, an elementary school teacher. Letty, as she is better

known, grew within an extended family of teachers and musicians, in an upper middle-class environment at a small town in the northern coast of Puerto Rico. She was educated at her hometown public school system and demonstrated outstanding qualities as a student.

After obtaining her High School degree at an early age, Letty enrolled at the University of Puerto Rico, Rio Piedras Campus (UPR-RP), to study Psychology, as an honor student. Although there were no psychologists in her family and she is not sure why she wanted to study Psychology, she thinks that she was interested in this profession because her family valued service professions (Herrans, 2018). In 1955, she obtained a bachelor's in arts with major in Psychology. Since Psychology was a developing profession and she was a very good student, she was encouraged by her teachers to pursue a master's degree in this area as soon as possible. She entered the Catholic University of America at Washington, DC, and in 1957, she obtained her master's degree in Educational Psychology and Higher Education. In 1969, she received her PhD degree in the same university, majoring in General Psychology.

After completing her master's degree, Letty Herrans began to work as a psychologist at a private interdisciplinary mental health clinic for children and adolescents in San Juan, PR, headed by Dr. Providencia Castro (1920–1999), a psychiatrist. The collaboration and teamwork at this clinic made her realize the complexities of the human mind and the importance of interdisciplinary interventions (Herrans, 2018). In 1959, this clinic was by public included in a public mental health program and became a training site for future psychiatrists.

In 1960, Herrans resigned from her position as psychologist at this mental health clinic, because she experienced discriminatory work practices toward psychologists, and with Virginia Sacarello (1930–2018), a colleague, opened a private practice to do psychological evaluations to children and adolescents referred by private and public schools' social workers and teachers. Shortly after, she was invited by Dr. Juan Nicolás Martínez, coordinator of the Program in Psychology at

the Faculty of Social Sciences of UPR-RP, to work as a Psychology professor.

Laura Leticia Herrans remained at UPR-RP, from 1960 to 1986, when she retired after many years of academic work. She taught courses in Personality, Measurements, Introduction to Psychology, Human Development, Psychological Evaluation, Supervision of Practicum, Internship, and Theses and Dissertations, at the undergraduate level and graduate levels. As a professor, she inspired students to be critical of psychological knowing, especially in the making of clinical interpretation of clients specially with those from diverse cultural milieu. She was director of the Department of Psychology for 4 years and also associate dean of Academic Affairs.

Dr. Herrans had as priority the development of a graduate program in Psychology in the Department of Psychology at UPR-RP. The program was designed following the guidelines of the American Psychological Association's PhD in Clinical Psychology. In collaboration with Dr. Irwin Hyman (1935–2005), a professor at Temple University in Philadelphia, she developed an academic consortium with the School Psychology Program at Temple, to promote the admission and exchange of students and faculties between the School Psychology program and the Department of Psychology at the UPR-RP. Over 15 Puerto Rican psychologists obtained their doctoral degrees at Temple, thanks to this consortium.

Dr. Laura L. Herrans' view of psychology as a science and as an art guided her academic career and student's training in clinical psychology. She encouraged students to do research in the areas of theories of personality and construction of valid and reliable instruments especially developed for a Puerto Rican population. These instruments are included in her book: *Psychology and Assessment: The Development of Psychological Tests in Puerto Rico* (2000). As a teacher and researcher, she emphasized the value of scientific endeavors. "Science does not exist without measurement" was an affirmation she often repeated (L. L. Herrans, personal communication, April 3, 2016). According to Dr. Herrans, bias in

psychological evaluations can only be controlled by the knowledge that the psychologist has on the principles that rule both science and measurement. Also, she said psychologists must conceptualize psychology as a diverse, complex and unique scientific field.

As a researcher, Dr. Herrans is well known for the adaptation and standardization of the Wechsler Intelligence Scale for Children-Revised (WISC-R), which became the *Escala Wechsler de Inteligencia para Niños, Revisada, para Puerto Rico* (EWIN, R, PR, 1992), as well as in the adaptation and standardization of the Wechsler Adult Intelligence Scale-III (WAIS-III, 2008). The standardized instrument in Spanish is known as *Escala de Inteligencia Wechsler para Adultos-III, Spanish, PR* (Pons et al., 2008). In collaboration with some of the participant researchers, Dr. Herrans engaged in the discussion of the validity, reliability, and standardization process, as well in the training of licensed psychologists in Puerto Rico. The impact of the work done in Puerto Rico and the importance of cultural biases in developing psychological instruments transcended Puerto Rican boundaries: its results were presented at different forums in PR, the USA, and Argentina, among others. Also, the methodology used in the development of the EWIN-R, PR (1992) was used as a guide for the adaptation of the WISC-R in Buenos Aires, Argentina.

In 1988, Dr. Laura L. Herrans, Dr. Juana M. Rodríguez, and Dr. Glorisa Canino designed a research project to measure the intellectual capacity of the inpatient population in the psychiatric public facilities of PR, to determine their capacity to express their right to vote in the general elections of the government in Puerto Rico. These researchers randomly selected a representative stratified sample and psychological tests to assess intellectual, emotional and neurological variables. The median IQ of the representative sample was 89, above the mentally retarded classification. A mental health and a physical profile were obtained, including demographic characteristics. This profile is still the only valid and reliable psychological and psychiatric profile of the

institutionalized mental inpatients in the island. From this work, Dr. Herrans and Rodríguez obtained and published norms for the Bender Gestalt and the Draw a Person tests, creating clinical criteria for codification (Herrans & Rodríguez, 1989).

With the collaboration of Puerto Rico's Mental Health and Addictions Services Administration, Herrans and Rodríguez, initiated in 1989, the EIWN-R project, to translate the Wechsler Intelligence Test for Children- Revised (WISC-R), adapt and standardize this test to a Puerto Rican population of children, age 6–16. Validity and reliability of the final instrument, EIWN-R-PR, were done. They developed the first instrument with Puerto Rican norms for our children (Herrans & Rodríguez, 1992). This project was funded by diverse federal, state, and private agencies.

In 1987, Laura Leticia Herrans, Juana M. Rodríguez, and Aida Herrans created a non-profit private corporation, Scientific Research and Educational Projects of Puerto Rico (ICPE, in Spanish), for the development and implementation of a training program for public and private care providers of infants and toddlers with and without impairment in Puerto Rico. The program was funded by Federal law P.L. 99–457 Part H, under the Council on Developmental Disabilities and later by the State Council on Developmental Deficiencies in Puerto Rico, until 2010. Through these years, besides the training of parents, teachers, and social workers, they created a network of day care centers and a directory of those certified to offer services to children with functional diversity. Moreover, they collected statistics on functionally diverse children and their referral for evaluation. The corporation published a booklet with all the training information and consulted with PR's Department of Family about any pertinent issues.

Dr. Herrans belonged to several professional associations, among them, Puerto Rico Psychological Association (APPR, in Spanish), of which she was president from 1970 to 1971; American Psychological Association (APA), where she coordinated the Committee of Ethnic Minority Affairs; National Association of School

Psychologists; and Interamerican Society of Psychology. She presided the Committee for the examination to license psychologists in Puerto Rico. She was appointed by the Governor of Puerto Rico to the Puerto Rico Board of Psychologist Examiners and was elected president of this organism. APPR recognized her contributions to Psychology in Puerto Rico by naming her Psychologist of the Year in 1986.

Dr. Laura Leticia Herrans died on March 23, 2020, after a long and debilitating illness. She is survived by her nephews, nieces and their children, her extended family, her friends, her colleagues, and her thousands of former students who value her teachings and continue working in developing new instruments for Psychological measure.

In 1954, she began her undergraduate studies in psychology at the University in Santiago de Chile.

She is considered the pioneer of psychology, since she is recognized, by the Technical Council of Psychology, as the first Panamanian psychologist. In 1960, she founded the direction of vocational and psychological psycho orientation for the National Border System and the National Institute for Vocational Training of the Republic of Panama.

She developed the curriculum for the degree in psychology at the Santa María la Antigua University, and from 1965, she devoted herself mainly to teaching evaluation and psychological orientation at the Santa María la Antigua University and the University of Panama, until her retirement in 2010.

Her main contribution has been in the training of new psychology professionals since 1965.

President of the Technical Council of Psychology, from 1975 to 1985, her contributions include the Code of Ethics of the Psychologist, recertification law, that proposes an exam, which psychologists must take every 5 years, to renew their certification, statutes of the Technical Council of Psychology, and the law that recognizes the professional practice of psychology.

Elcira Herrera was the founder of the Panamanian Academy of Psychology (1975), of the Panamanian Association of Cognitive Behavioral Therapy and of the Panamanian Association of Psychologists in the same year. She also was President of the Panamanian Association of Psychology (1976) and the coordinator of the first scientific conference on therapeutic hypnosis in Panama, entitled “Advances in Hypnotherapy in Panama” held in 2004.

Argentina · Psychology · Psychology programs · University

He was one of the pioneers in the professionalization of psychology in Argentina, contributing to the creation of Psychology Programs, as well as to the development of the professional role of the psychologist at public institutions.

Plácido Horas arrived to San Luis in 1943 after graduating with honors from the *Facultad de Filosofía y Letras de la Universidad de Buenos Aires* (Faculty of Philosophy and Humanities of the University of Buenos Aires) to work as a professor at the Universidad Nacional de Cuyo, UNC (National University of Cuyo), which had opened a branch in that city three years earlier.

He settled down in San Luis, married Elena Ossola (1922–1989), and had four children: Silvia, Jorge, Guillermo, and Martha.

From 1943 to 1965, he directed the *Instituto de Investigaciones Pedagógicas* at UNC (Pedagogical Research Institute), which was called Instituto de Investigaciones Psicopedagógicas (Psychopedagogical Research Institute) since 1956. There, Horas began a profuse academic activity including teaching, research, community service, and public communication of psychological science, promoting its development at the university as well as at several state institutions and civil organizations of San Luis. He managed agreements between this institute and the local government to create various applied psychology centers such as the *Dirección de*

Psicología Educativa y Orientación Profesional (Direction of Educational Psychology and Professional Guidance) and the *Centro de Criminología* (Centre of Criminology). He also directed the publication of the scientific journal called *Anales del Instituto de Investigaciones Psicopedagógicas* (Annals of the Institute for Psychopedagogical Research) (Muñoz et al., 2013).

This activity laid the foundations for the creation of the undergraduate psychology program in San Luis, which he organized and directed since 1958. He taught several courses such as Child and Adolescent Psychology, Educational Psychology; Vocational Guidance, Dynamic Psychologies, Objective Psychologies, and Legal Psychology. He devoted much of his academic life to the latter becoming an outstanding reference of the field in the region (Horas, 1971, 1981; Horas & Humberto, 1971). He also held various university government positions.

He was a very active member of the Interamerican Society of Psychology (SIP), where he served as Vice-President for South America from 1963 to 1964.

He was also a member of the *Comisión Regional del Consejo Nacional de Investigaciones Científicas y Técnicas, CONICET* (Cuyo Regional Commission of the National Council of Scientific and Technical Research) between 1959 and 1965.

Three main features of his thought and management of academic psychology may be highlighted.

Firstly, his epistemological-anthropological position was the basis of his institutional management of the psychology program. In fact, Horas started from a vision of biopsychosocial and spiritual unity of the human person from which he defined that psychology should be fundamentally devoted to the study of personality and behavior from its biological, psychosocial, and spiritual bases. Consequently, it conceived a science of wide horizons, always open to the assimilation of the diversity in the complex unity of human beings and the science that studies them. Integrating and synthesizing differences from scientific evidence, with a vision of totality, was a

fundamental undertaking that could not be limited by any type of reductionism or bias (Horas, 1955). This imprint was strong in the original profile of the psychology program. This implied achieving a balanced psychology, not exclusively centered in the psychoanalytic biases predominant in the country. In fact, he promoted the development of other areas such as educational and legal psychology, or experimental approach research and studies in psychophysics, among others (Piñeda, 2010).

Secondly, Horas argued that academic psychology would be developed from the regional social demands and integrated into the international scientific community. The agreements that he managed between the national university and the provincial state allowed for a strong articulation between teaching, research, and community service, which are pillars of university life. However, according to Horas, solving the problems of the region demanded a careful critical look at overseas psychology. In his constant demand for learning, some of his friends testified that he used to eagerly receive journals from all over the world to catch up on various areas and topics, and he shared this material with his colleagues and students to encourage them to update their knowledge (Berastain de Montoya, 1995; Piñeda, 2007). On the other hand, he took part in many international scientific societies, contributing to meetings and publications.

Together with “Nuria Cortada de Kohan” (1921–2013), Horas was the Argentine representative at the First Latin American Seminar on Training in Psychology organized by “Rubén Ardila” (1942–) in Bogotá in 1974 to think about and discuss the training needs of Latin American psychologists (Ardila, 1978). Likewise, the international vision that Horas had of psychology was reflected in the policies of postgraduate training that he promoted. By inviting foreign professors to teach postgraduate courses, or fostering their colleagues to study abroad, Horas made possible the opening to new approaches and lines of research, which undoubtedly had an impact on professional practices, trying not to

reproduce the limitations of the country’s dominant biases. On the other hand, the requirement to be attentive to social demands for Horas implied a constant exercise of listening to the voice of the students, whose instituting force he managed to capitalize on.

Finally, Horas assumed the challenge of articulating an academic and a professional culture in the same community of psychologists. He was one of the organizers of the psychology program in San Luis, which already in 1958 provided for the possibility of getting a PhD in Psychology. Being one of the oldest of its kind in the country, this program graduated the first psychology doctor from an Argentine university (Piñeda, 2018). His labor at the research institute contributed innovations to the national scientific psychology, even with all the budgetary limitations that always characterized the Argentine university, seeking agreements with Consejo Nacional de Investigaciones Científicas y Técnicas-CONICET (National Council for Scientific and Technical Research) or other national and international agencies.

Since 1973, the psychology program depended on the newly organized *Universidad Nacional de San Luis* (National University of San Luis) where Horas worked until his retirement. This institution granted him the recognition of Professor Emeritus and Doctor Honoris Causa.

In 1986 he was awarded *Premio Konex* (Konex Prize) in Psychology as a part of the list of 100 outstanding figures in the Argentine humanities. In 1989 he was enrolled as a Full Member of the *Academia Nacional de Ciencias de la Educación* (National Academy of Educational Sciences).

His human quality and his fruitful academic career opened the way to scientific and professional psychology in San Luis.

Brazil · Armed struggle

Iara Iavelberg was a Brazilian psychologist trained at the University of São Paulo (USP). She was a teacher in student union's course at the Philosophy's Faculty, and in 1968 she became an assistant professor at the Institute of Psychology at USP. As a student and as a professor, she was a member of some leftist organizations such as Revolutionary Marxist Organization – Worker's Politics (POLOP), Popular Revolutionary Vanguard (VPR), and the Revolutionary Movement 8th October (MR-8). About her short professional performance at the university, it was said that: "In the classes she taught, a few ones, Iara had fun in contesting behaviorist psychology and official science" (Patarra, 1992, p. 198). Part of Iara's activities, in the Social Psychology department, was dedicated to the content analysis of Fidel Castro's speeches (1926–2016), but "she didn't finish this work because she disappeared"

(Centro Acadêmico Iara Iavelberg, 2014). She started her activism in the student movement, and gradually, with the deepening of the corporate-military dictatorship that was in power in Brazil from 1964 to 1985, she moved into more combative militant sectors. She was arrested in an apartment in a meeting with other militants in 1968, and among the seized books was Marx's Capital. A petition circulated in USP's Psychology Institute for her release. With the expansion of repression and Brazilian state terrorism, she was forced to abandon teaching psychology and became a clandestine militant. She approached revolutionary Carlos Lamarca (1937–1971), who had deserted from the Brazilian Armed Forces carrying an arsenal of rifles. She made a guerrilla training in Ribeira's Valley. Iara also had the task of coordinating the theoretical discussions in Ribeira's Valley, using some available books, including Paul Sweezy (1910–2004) and Adolfo Sanchez Vasquez (1915–2011).

Still there, she defended the position that it was necessary to consider that the revolutionaries' psychological conditions were fundamental for the fulfillment of their tasks and criticized her comrades who had allowed the presence of a militant who, according to her hypothesis, had a paranoid schizophrenia profile. She had the sensitivity to consider that psychological monitoring could be one of the specific activities that psychologists could play in the armed struggle since the harsh measures imposed in the underground had implications for subjectivity. That is why, in her

organization, “Iara insisted on providing psychological assistance to militants, her function in the armed struggle” (Patarra, 1992, pp. 348–349). On this subject, the testimony of Inês Etienne (1942–2015), the only survivor of a clandestine torture center called Casa da Morte (House of Death), was revealing: “For her, as important as the discussions on strategy and tactics, was the psychological situation of the militants, who wished it to be the best as possible. She suggested that the organization create conditions for the companions to have a place where they could rest from the tensions to which they were submitted” (Patarra, 1992, p. 349). Iara was known for having her face printed on several posters with the phrase: “Wanted Terrorists. Help to protect your life and that of your family members. Notify the police.” She was murdered in the city of Salvador, Bahia, in 1971. The official version said that she committed suicide in an exchange of gunfire with agents of repression (Sacerdote, 1993). A little more than four decades later, her niece scripted the documentary *Em Busca de Iara* (In Search of Iara), in which she manages to prove, with expert doctors, that the psychologist was murdered, as well as the causes of her death were covered by the Brazilian State (Frederico et al, 2013).

Iara Iavelberg’s biography shows that she was one of the psychologists who helped to expose the repressive character of state terrorism and the contradictions in the construction of psychology in Brazil. On the one hand, psychology expanded after its intense institutionalization process, with the enlargement of training courses; on the other hand, the increase in the number of professionals trained in this period did not mean that the psychologists should take a stand against the corporate-military dictatorship. At that moment, there was not still space for positions like those of Iara Iavelberg, and therefore, her revolutionary practice stood out at the expense of its theoretical construction. Those were times when psychology did not allow this type of positioning. Nevertheless, the psychology that Iara Iavelberg defended should necessarily be linked to the overthrow of the dictatorship, at the same time that it was committed to the psychological accompaniment of the revolutionaries in the armed militancy.

Ingenieros, José

Born *Palermo, (Italy), 24 April 1877*

Died *Buenos Aires, (Argentina), 31 October 1925*

Rubén Ardila

National University of Colombia, Bogotá, Colombia

Keywords

Argentina · Experimental psychology · Criminology · Philosophy · Culture

One of the most recognized and influential persons of Argentine and Latin American culture is José Ingenieros (1877–1925). He was a psychologist, criminologist, philosopher, and culture historian, among other callings. He made pioneering contributions in all these areas and many of them are still relevant today, a century later. His contributions to the psychology of the time were very influential, including his books, conferences, articles, the journals he founded, his professorship at the Universidad de Buenos Aires (University of Buenos Aires), and his participation in the intellectual life of that era, in Argentina and worldwide.

His family immigrated to Argentina. Ingenieros studied medicine at the University of Buenos Aires and graduated in 1900. Some of his biographers (Torchia-Estrada, 1961, 1967) divide the life of José Ingenieros into several periods; (1) *The socialist*, a period during which he wrote a work entitled *What is socialism?* (1895) and when he was also elected as secretary of the Argentine Socialist Party, all of this before his 23rd birthday. Throughout his life, he maintained his commitment to social justice, socialist ideas, and collaborated with Argentine and international groups. (2) *The psychologist* period, which began in 1900 upon receiving his doctorate in medicine with his thesis: *The Simulation of Madness*. During this phase, he was appointed as Associate Professor of Psychology at the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) of the University of Buenos Aires. A year later, he participated in the Fifth International Congress of Psychology, which convened in Rome, and there he met many of the leading psychologists of the early twentieth century. In 1907, after his return to Argentina, he was appointed Professor of Experimental Psychology at the University of Buenos Aires. The following year (1908), in the company of other psychologists, he founded the Sociedad de Psicología (Psychology Society). This Society was reorganized in 1930 by Enrique Mouchet with the name of Sociedad de Psicología de Buenos Aires (Buenos Aires Society of Psychology). His psychological papers emphasized the perspective of natural science, evolution, behavior, and continuity between the psychological processes of nonhuman animals and our species (3) *The philosopher* period began in 1911 when Ingenieros moved to Europe where in Madrid he published several books, among them *El Hombre Mediocre* (1913) one of his best-known and most widely read works. Upon his return to Argentina in 1915 he was appointed professor of history of philosophy. During this period, he founded the *Journal of Philosophy* (1915) and a literary collection called “Argentine culture.” (4) *The culture historian* period: With the publication of the first volume of his work *The Evolution of Argentine Ideas* (1918), he began his stage as a cultural historian, which would be his

last role in life. He published several books on cultural movements in America and Europe, and again became interested in psychological and philosophical matters.

Ingenieros died on October 31, 1925, in Buenos Aires, when he was only 48 years old. He always claimed that he wanted “to die before to grow old” and that was really the case.

Ingenieros’ contributions to Argentine and Latin American culture, psychology, criminology, and sociology are well-recognized. In the specific case of psychology, his first publications were articles for newspapers of a general nature. During his years as a medical student, he published articles of psychopathology and criminology. One of his professors, Francisco de Veyga (1866–1942), greatly influenced the young Ingenieros. When de Veyga founded the journal *Archives of Legal Criminology and Psychiatry*, he invited the 24-year-old Ingenieros to be in charge of the journal. This publication helped raise the level of criminology and psychiatry in Argentina. Many important studies in these areas were published in that journal and Ingenieros himself authored several articles therein. Ingenieros edited the *Archives* between 1902 and 1913.

There are several sources on the production of José Ingenieros. The following stand out: *Complete works* (1937), and *Anthology: His thinking in his best pages* (1961). Biographies include Bagú (1936), Bermann (1926), Peralta (1922), and several essays on Argentine philosophy and culture in which José Ingenieros’ contribution to Latin American thought is relevant.

These psychological works are framed in the experimental psychology of the early twentieth century, influenced by the theory of evolution and the developments achieved in Germany, the United States, France, England, and other nations. Ingenieros was an original thinker, a great teacher, and a visionary of his time (Ardila, 1970).

Ingenieros defines psychology as “the natural science that studies the psychic functions of living beings” (1937, p. 422). For him, there is no basic difference between the biological world and the psychological world. There is nothing that can be called “soul” or “spirit” outside of biological functions. The method of psychology is the

observation of behavior: “Psychological phylogenesis can only be reconstructed by observing the behavior of living beings, that is, by studying the ways in which they express their psychological functions” (Ingenieros, 1937, p. 391). The psychological system of José Ingenieros is characterized by naturalism, evolutionism, and the genetic method.

For Ingenieros, psychological functions are elemental processes of all living beings, in all stages of evolution. Instincts are acquired in the process of evolution, they are not limited to non-human animals, nor is intelligence exclusive to human beings. Both instincts and intelligence exist in humans and animals, according to his words, living beings “think with the whole organism.” The conscious state of a phenomenon depends on its relationship with previous experiences. He asserts (Ingenieros, 1937, p. 292) that the possibility of a maximum of consciousness corresponds to a maximum of experience.

His psychological system, with solid scientific foundations and a philosophical emphasis, was considerably ahead of his time. Many of his ideas in psychology, ethics, philosophy, criminology, and cultural worldview have withstood the test of time, although surely with transformations and additions. Ingenieros is one of the most creative and original psychologists that Latin America has produced.

Itzigsohn, José Alberto

Born *Concordia, Entre Ríos, Argentina, July 17, 1924*

Died *Jerusalem, Israel, January 30, 2018*

Luciano Nicolás García
Facultad de Psicología, Universidad de Buenos Aires – Consejo Nacional de Investigaciones Científicas y Técnicas, Buenos Aires, Argentina

Keywords

Argentina · Israel · Soviet neurophysiology · Developmental psychology · Psychiatry · Teaching · Department direction · Translations · Political activism

Born in a Jewish Russian family, akin to rationalist and socialist ideas, Itzigsohn related to his cultural background more from the experience of discrimination rather than religious tradition. He adhered to an antifascist stance during the 1930 and 1940 decades, and in 1943 he started his medical studies at Universidad Nacional de La Plata (La Plata National University). In La Plata, the capital city of Buenos Aires Province, he became close to leftist Jewish activists which promoted Zionism. In 1948, he was part of Mitnadvei Hutz LaAretz, foreign volunteers to Israeli forces during the Arab-Israeli War, both on the frontline and in a psychiatric hospital, where he defined his interest in this specialty (García, 2016; Klor, 2017).

Back in Argentina, in 1952, he joined the Argentine Communist Party, and during that decade he specialized in psychiatry and obtained a medical doctorate under the direction of the communist intellectual and psychiatrist Jorge Thénon (1902–1985). During those years, together with Thénon, Antonio Caparrós (1928–1984), Juan Gervasio Paz, and Nicolás José Torres, he formed a group devoted to studying and promoting Soviet psychophysiology and psychology. Itzigsohn then translated a series of Ivan Pavlov's articles in *Los reflejos condicionados aplicados a la psicopatología y a la psiquiatría* [Conditioned reflexes applied to psychopathology and psychiatry], in 1954, and Konstatin Bykov's *Manual de fisiología* [Physiology handbook], in 1959. In 1958, this group opened a private clinic, Centro Médico Bulnes, also known as Clínica Bulnes, equipped for using pavlovian psychiatric techniques, such as sleep therapy and specific forms of insulin therapy and psychotherapy. At the same time, he worked and taught in the Hospital Nacional Neuropsiquiátrico de Hombres [Men's National Neuropsychiatric Hospital] and the Policlínico Lanús [Lanús Polyclinic]. He got in contact with Mauricio Goldenberg (1916–2006) and, like him, supported the inclusion of psychologists as mental health workers, which was resisted by most psychiatrists, including Thénon and other comrades.

During the first half of the 1960s he was in charge, with Caparrós and Paz, of the three initial

courses of Psicología [Psychology] at the recently created Psychology Program in the Facultad de Filosofía y Letras de la Universidad de Buenos Aires [Faculty of Philosophy and Humanities at the University of Buenos Aires]. Those courses promoted both a Soviet psychology and psychophysiology, and European developmental psychology, in particular the works of Henri Wallon (1879–1962), Jean Piaget (1896–1980), Sergei Rubinstein (1889–1960), and Lev Vygotsky (1896–1934). Those authors were published by communist-related publishing houses such as Lautaro and Proteo, in which Itzigsohn directed several collections. Most notably, he wrote a prologue for Vygotsky's *Pensamiento y Lenguaje* [Thought and Language], published in 1964, where he denounced the ongoing negative effects of Stalin's "cult of personality" in sciences, including the reduction of psychology to Pavlov's theories and the early censorship of Vygotsky in the USSR (Itzigsohn, 1964). These teaching and publication efforts were key for the organization of developmental psychology in Argentina, in particular the diffusion of piagetian and vygotskian theories (Caruso & Fairstein, 2003; García, 2017).

By then, the group from Clínica Bulnes became critical of Argentine communism and its pavlovian orthodoxy, led by Thénon, and offered their own form of psychotherapy based on contemporary soviet psychophysiology and psychology, and dynamic psychiatry, named "psicoterapia de la personalidad" [personality psychotherapy], as an alternative to both "psicoterapia racional" [rational psychotherapy] promoted by orthodox pavlovian psychiatrists, both in the USSR and Argentina, and to psychoanalytical approaches, which quickly became the mainstream in Argentina (García, 2015; Vezzetti, 2016; Carpintero & Vainer, 2018). Also, in 1964, Itzigsohn was elected director of the Department of Psychology at Buenos Aires University, where he promoted, together with his comrade Juan Enrique Azcoaga (1925–2015), the creation of an experimental laboratory, based on the then contemporary neurophysiology. By the time the equipment and location were set up, the *coup d'état* of June 28, 1966, had taken place and

military violently intervened with the running of the university. Itzigsohn and his colleagues, together with most of the faculty professors, resigned, and the laboratory was dismantled. This was the first – and still only – concrete attempt to create a laboratory for the psychology undergraduate program at the University of Buenos Aires.

Since 1962, there was an ongoing discussion within communism on the role of the Soviet Union in Middle East and the persisting anti-semitism in the USSR, which Itzigsohn witnessed during a trip to the USSR and Eastern Europe in 1956. Following the Soviet intervention against Israel during the events of the Six-Day War of June 1967, Itzigsohn quit the Argentine Communist Party and devoted himself to pro-Israel activism with José Bleger (1922–1972) and other ex-communist Jews (García, 2012). For the next 9 years, he promoted peace politics and a laic progressist Judaism in the pages of several leftist Jewish journals, such as *Voz libre* [Free voice] and *Nueva Sión* [New Zion]; he continued to work privately as psychiatrist and directed a collection of psychiatric books in the leftist publishing house Granica, until a new *coup d'état* on March 24, 1976, led him to exile in Israel, where he settled definitively.

In Israel, he worked and taught in the Ezrat Nashim Hospital – now Herzog Hospital – and in the Hebrew University of Jerusalem, where he continued promoting Vygotsky's psychology, while turning to community psychiatry and Anglo-Saxon models of short-term psychotherapies. He later became visiting scholar in the Pontificia Universidad de Salamanca, where he taught and published about his professional work in Israel (Itzigsohn & Dasberg, 1985). He also continued his activism, both professionally, founding the Asociación de Trabajadores de Salud Mental en Lengua Hispánica de Israel [Spanish Speaking Mental Health Workers Association], and politically, with several initiatives of the leftist Israeli parties of MAPAM, first, and MERETZ, later, in the Histadrut – Israel's Federal Workers Organization – and the Knesset – Israel's legislature. He published two more books related to Jewish themes, *Tras las huellas de Ashkenaz* [In

Ashkenaz's Footsteps] (Itzigsohn, 1989) and *La marca de Abel* [The mark of Abel] (Itzigsohn, 2004), and continued his contributions to progressive Jewish journals such as *Nueva Sion* and *Convergencia* [Convergence]. In 2005, he was distinguished as Honorary Professor of the Faculty of Psychology at the University of Buenos Aires.

Psychotherapy

Pierre-Marie-Félix Janet was a physician and philosopher, trained in the tradition of pathological psychology in France, under the triple patronage of his uncle, Paul Alexandre René Janet (1823–1899), Jean-Martin Charcot (1825–1893), and Théodule-Armand Ribot (1839–1916) (Carroy & Plas, 2012, p. 60). Raised in a bourgeois and catholic environment, Pierre Janet developed, at the end of the nineteenth century, based on a psychological and organicist conception of hysteria, and from the observation of other psychopathological phenomena such as phobias and obsessive symptoms, a method named by him “Psychological Analysis (*Analyse Psychologique*),” which cannot be reduced, as is often proposed, to be a precursor of

psychoanalysis, as it was developed by Sigmund Freud (1856–1939).

Pierre Janet began his studies at the *École Normale Supérieure* in 1879, in a generation of future *normaliens* which included Émile Durkheim (1858–1917) and Edmond Goblot (1858–1935). After his *agrégation* in Philosophy on 1882, he occupied the position of professor of philosophy at the Lycée of the Havre, where Joseph Henri Albert Gibert (1829–1899), a physician interested in magnetism, supporting his clinical interests (Janet, 1930, p. 135), reorientated the attention Janet manifested on hallucination toward hypnotic phenomena, bringing to Le Havre a renowned somnambule, Léonie Leboulanger (Carroy, 2002, p. 129), who would be studied by Janet and, subsequently, presented as a case of hysteria with splitting of personality to the incipient Society of Physiological Psychology, presided by Jean-Martin Charcot. Said case was also presented by Janet to the Society for Psychical Research (UK), with both societies sending observation commissions to Le Havre. Following these decisive events, Janet developed a wide academic and research career in Paris, under the tutelage of Jean-Martin Charcot.

Pierre Janet resided permanently in Paris, with the exception of his teaching years at Le Havre, and the trips that allowed him to present multiple international conferences and courses, some of which were taught in Latin America. Among these we will highlight his course at Mexico City

in 1925, later published by the publishing house Fondo de Cultura Económica (Fund of Economic Culture) under the title of *Psychology of Feelings* (Janet, 1997), and another he taught in Buenos Aires on September 1932, on “the feelings of emptiness on the alienated and neuropathic” (Romero, 2009), which derived in its synthesized version on October, that same year, in the magazine *Semana Médica* (Medical Weekly) (Falcone, 2013, p. 93).

The effects of Janet’s presence in Latin America would seem to form at least three figures, all neither nonexclusive, nor necessarily geographically located: firstly, that of Janet as a representant of his predecessors, as illustrated by the case of Argentina, already strongly influenced by Charcot and Ribot, where it would appear the specificity of Janet’s work could be his study on mental automatism (Klappenbach, 2006, p. 116). Secondly, the figure of Janet as the practitioner of a psychological analysis close to psychoanalysis, but without Freud’s insistence on infantile sexuality, as it is illustrated in Janet’s presentation in Chile, in 1927, by Benjamin Subercaseux Zañartu (1902–1973) (Rupertuz Honorato, 2017), disseminator of Janet’s ideas in Spanish, or in the thesis devoted to psychoanalysis presented by Manuel Guevara Oropeza (1899–1980), in 1923, in Mexico (Capetillo, 2012, p. 131).

The third figure of Janet’s presence is that illustrated in the case of Mexico by its institutional impact: invited by the person who was appointed first director of the Asylum of La Castañeda in 1910, José Mesa Gutiérrez (1871–1941), Janet stays in Mexico during July and August of 1925, with teaching and advisory duties in hospital institutions (Capetillo, 2012, p. 100). On 1926, as a likely consequence of his visit, crowning a series of local political and academical efforts, the formal instruction of psychiatry is established at the Universidad Nacional de México (National University of Mexico), with an obligatory course in psychiatry for every student in the Escuela de Medicina (Medicine School) (Rocha, 1998).

Beyond Janet’s political influence, concerning his theory, the paradoxical effect of his work in Europe seems to replicate in Mexico. Looking for a psychological analysis distant from the Freudian

theses, his work seemed to merge with them; in Janet’s insistence on his demarcation from psychoanalysis, his work ended introducing that of the Viennese neurologist.

If Janet’s academic contributions are present since the first official psychology course in Mexico, taught in the Escuela Nacional Preparatoria (National Preparatory School) in 1897, by Ezequiel Chávez (Ezequiel Adeodato Chávez Lavista), it is Enrique O. Aragón, who in 1910 already shared with Chávez the course on psychology and moral, who will particularly deepen both theoretically and clinically not only in Janet’s work, but also on the contributions of Babinsky and other researchers and clinicians at the *Salpêtrière*, producing both a consistent series of publications, and a clinical practice on hysteria.

Janet’s contribution to Mexican Psychology is present in a clinical practice and a research thinking of a psychology that does not consolidate yet as a profession, and still does not differentiate itself from psychiatry, in the first two decades of the twentieth century. Two later milestones will mark the evolution of the history of training in psychology in the country. First, the arrival of exiled physicians from the Spanish civil war, (Postel & Quétel, 2000, p. 529), that allows the development of an emphasis in an organicist conception of the mind at the academic courses in the decade of the 1940s and secondly, in the next decade, the arrival of Erich Fromm in 1949, and that of the first Mexican psychoanalysts trained abroad, which will position the psychoanalytic theory as an hegemonic current of a clinical practice of the neurosis, closing the way to Janet’s influence.

If in the 1880s of the nineteenth century Freud and Janet would quote each others’ works and present it as confirmation of their respective scientific discoveries in the Franco-German psychology, Janet’s refusal to generalize his observations on the causal link between trauma and hysteria to a broad theory of the mind (Janet, 1930, p. 128), and Freud’s development of a theoretical system based not anymore upon the hypothesis of a weakening of the ego synthesis (Janet), but upon the dynamic hypothesis of defense – *Abwher*, generalized to the psyche’s functioning in 1900, and to the matters of culture, history, and social

phenomena around 1920, ended by securing psychoanalysis a predominant presence in Western academic circuits in at least the first half of the twentieth century and caused a progressive overshadowing of Janet's international presence. A deeper examination of the latter's work reveals, nevertheless, the unmatched quality of his clinical observation and records, the confection of a first system of dynamic psychology, the isolation of psychasthenia as a clinical entity – later described by Freud as obsessional neurosis or compulsion neurosis (*Zwangneurosen*) – and also, a non-negligible element, it reveals the testimony of a foundational moment of psychology as a science, that encompasses a history that takes over demonology and animal magnetism and prepares, from hypnosis and suggestion, the pillars of a clinical psychology and even, as it has been observed, opens the way to the development of an experimental social psychology in the twentieth century (Carroy, 1991, p. 176).

Formalization of reality

Master María de la Luz Javiedes Romero is a Mexican academic. She began her academic career in 1970, the year in which she obtained from the Facultad de Filosofía y Letras (Faculty of Philosophy and Letters), Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM), her bachelor's degree in Psychology. That was 4 years before the Psychology career was officially recognized in Mexico (until 1974, the federal government granted official recognition to the Psychology career, which gave the right to students to obtain professional credentials to practice as psychologists in México) and 3 years before the foundation of the Facultad de Psicología (Faculty of Psychology) (FP) (UNAM) at the University City. To those years, the training of psychologists in Mexico was incipient, not to say the training of social psychologists. However, in those years and from the Faculty of Philosophy and Letters of the UNAM, there were teachers and students interested in the study of Social Psychology. It is worth noting that for the development of her undergraduate thesis, *Students and the problem of peace*, she was advised by Dr. Héctor Capello (born 1935), an important academic who influenced the young Javiedes, especially in shaping her interest in Social Psychology. Thus, Luzma, as she is called by those who know her, colleagues, friends, and students, took the baton to decisively contribute to the professionalization and institutionalization of Social Psychology in Mexico.

Also contributing to her training was the Diplomado en Teoría Sociológica Contemporánea

(Contemporary Sociological Theory Diploma) she studied between 1996 and 1997 at the Facultad de Ciencias Políticas y Sociales (Faculty of Political and Social Sciences) (UNAM) and the Maestría en Psicología Social (Master of Social Psychology), which she studied in the Posgrado of FP (Postgraduate Program) at the same university, where she obtained a master's degree in Social Psychology in 1999 with the thesis "The reality: an empirical approach."

Javiedes has participated in seminars, workshops, and refresher courses organized in FP and other UNAM Faculties, as well as in other higher education institutions, such as the Colegio de México (College of Mexico) (COLMEX) and the Universidad Autónoma Metropolitana (Autonomous Metropolitan University) (UAM), in areas of Social Psychology, Epistemology and Methodology in Social Sciences, Psychological Research Techniques and Methods, Contemporary Sociology and Conflict Theory, Social Identity, Knowledge Transmission and Historical Consciousness, Construction and Transmission of Knowledge, Epistemology and Methodology of the Social Sciences, Conflict and Social Influence, Psychosocial Methodology, Epistemology, and Science Teaching, among others.

As an academic, she has trained generations of social psychologists. Her teaching activity includes 3 years in which she served as a full-time professor at the UAM-Xochimilco (UAM-X) (from 1977 to 1979), where she taught the modules on Culture and Personality, Social Psychology, and Human Processing Information. In 1979, she became a full-time professor C in the FP at the UNAM, within the Coordination of Social Psychology, where for almost 40 years she taught and directed thesis. The subjects she taught in the previous curriculum in this institution were Socialization, Ecological Psychology, Cross-Cultural Psychology, Research Methods and Techniques, Attitude Change, Directed Social Change, Construction of One-Dimensional Scales, Introductory to Social Psychology, and Advanced Social Psychology, among others.

In the actual version of the curriculum for the bachelor's degree in Psychology at the UNAM (2008 and later), students are able to take three subjects in Social Psychology (within the subjects

corresponding to the initial formation), and this is undoubtedly due to Javiedes. Her participation during the design of the current study plan had this result since she proposed, defended, and convinced of the relevance that the initial training of every psychologist who passes through the UNAM classrooms must include psychosocial knowledge. The value of this achievement is because psychosocial knowledge is highly formative in the understanding of human behavior, which results in a comprehensive training of this type of professional.

Authors usually are for most academics and students, characters who contributed concepts and ideas located within an amalgam of names. For Luzma, authors are the “masters” who guide, who mark the way. Knowing in depth Social Psychology and the authors who have created it, wherever they come from, she refers to them by the correct title. Anyone who knows her will have heard her countless times, when referring to an author, saying: “the Master. . . said.”

Her commitment to knowledge led her to be recognized by her peers as an expert in Social Psychology and Social Sciences. This is a virtue that has benefited the institutionalization and consolidation of Social Psychology and her guild.

Extracurricularly, she has taught courses, workshops, and seminars at various higher education institutions aimed at teachers, at the UNAM itself, and at the universities of Puebla, Campeche, Yucatán, Guadalajara, Durango, Sonora, and Sinaloa such as Methodological Approaches in Social Psychology, Types of Research, Evaluation of Social Action Programs, Beliefs in Social Psychology, Attitudes and Attitudes Change, Research Methods, Epistemology of Social Psychology, Qualitative Research Methodology, Social Psychology of Knowledge, Psychology of Science, Social Psychology, Science and Epistemology, Evolutionary Epistemology and Radical Constructivism, Research Methodology: The Survey, Epistemologies in Psychology, Beliefs and Attitudes, Common Sense, Social Psychology of Groups, Psychology of the Collective, Social Psychology of Everyday Culture, and Psychology of Daily Life, among others.

Javiedes was one of the founders of the master’s degree in Social Psychology at Benemérita

Universidad Autónoma de Puebla (Meritorious Autonomous University of Puebla) (BUAP), which emerged in 1992, as she participated in the design and development of the study plan. Also, in that master’s degree, she served as professor, until 1996, where she taught the Seminars of Epistemology, Methodology I, and Methodology II. She also served as visiting professor in the master’s degree in Social Psychology at the Faculty of Psychology at Universidad Autónoma de Querétaro (Autonomous University of Querétaro) (UAQ). It is worth highlighting her determined support for the creation of the current Postgraduate (Master and Doctorate) in Social Psychology at the UAM, at Iztapalapa Unit (UAM-I). Her lines of research are Social Thinking, Knowledge Construction, and Social Psychology.

From 1977 to date, Luzma has advised and tutored dozens and dozens of undergraduate and master’s students. She has served as a reviewer and synod in numerous thesis committees and degree programs at the bachelor and master level. She has developed and reviewed programs for various subjects, both from the current curriculum of the FP of UNAM and from the previous curriculum.

She has participated in countless outreach activities such as conferences, symposiums, and round tables. She has been the author of the communication of research results in national and international congresses of her specialty with topics such as Social Research: Application and Alternatives of Old-Age Assistance Programs; Methodological Trends in Psychosocial Research; Social Identity in Two Cultural Groups: Mexican and French; Health and Its Psychosocial Context, Psychosocial Factors of Migration in the Mixteca Alta of Oaxaca; Reality and Social Concepts in students; Modalities of Relationship Between the Social Psychologist and the Community; Science and Everyday Life; The Conception of Reality in Three Social Groups; The World of Objects; Social Thought; Rumor; Beliefs; and Anomia, among other communications.

Luzma has also been a member of the Editorial Committee of the *Revista de Psicología Social y Personalidad* (*Journal of Social Psychology and Personality*) and the *Revista Mexicana de Psicología* (*Mexican Journal of Psychology*), member of the Scientific Committee of Social Perspectives of the University of Texas and

Universidad Autónoma de Nuevo León (Autonomous University of Nuevo Leon) (UANL), and participant as editor of *Psic. Soc. Revista Internacional de Psicología Social (Psic. Soc. International Journal of Social Psychology)*, from the BUAP and the Universidad de Guadalajara (University of Guadalajara) (U de G), as well as a member of the Editorial Committee of *El Alma Pública. Revista desdisciplinada de Psicología Social (The Public Soul. Disciplined Journal of Social Psychology)*.

Among Javiedes publications, we can mention *The Thought of Social Psychology and Identity in Two Cultural Groups: France and Mexico*. Its production also includes the following didactic materials published by the Didactic Material Program of the FP of UNAM: *The Psychological Structure of Intergroup Relations, Basic Postulates Around the Formation and Change of Attitudes; Resistance to Attitudinal Change: Ideological Immunization; The Model Opportunity-Motivation of R.H. Fazio; Resistance to Attitudinal Change and Psychological Reactance; and The Sociocognitive Model of the Structure and Function of Attitude*. They are important teaching materials in the dissemination of psychosocial knowledge among colleagues and students.

Carlos Jesinghaus arrived in Argentina in 1913 from his native, Germany. He was born in Düsseldorf in 1886, and he was trained and got his PhD. at the Wundt's laboratory, in Leipzig. He came to Argentina to replace Dr. Friedrich Emil Otto Schultze (1872–1950) in the university chair from the “Instituto Nacional del Profesorado Secundario” (National Institute of High School Professorship) (Foradori, 1935). Carlos Jesinghaus was left in charge of the Philosophy Department of that same institute (Klappenbach, 2007). At the same time, he headed the Experimental Psychology department from the “Instituto Nacional del Profesorado Secundario” (National Institute of High School Professorship) from Paraná, Entre Ríos (up to 1927). Also, he published texts about philosophy and psychology, inspired by Wundt (1832–1920), for example, “Las ideas pedagógicas de Wundt” (Jesinghaus, 1919) (The pedagogical ideas of Wundt).

In 1923, he taught a course called “Psicología de los Pueblos” (Völkerpsychologie). At the same time, he replaced the philosopher Coriolano Alberini (1886–1960) at the second course in Psychology at the Facultad de Filosofía y Letras de la Universidad de Buenos Aires (Faculty of Philosophy and Humanities at the University of Buenos Aires) (Gotthelf, 1969). In that same year, during a Congress devoted to work issues, Jesinghaus presented a project that proposed the creation of the “Instituto Central de Orientación Profesional – ICOP” (Central Professional Guidance Institute) in Buenos Aires (Jesinghaus, 1924). The project was presented to the Minister of Justice and Public Instruction Antonio Sagarna (1874–1949) and was achieved by a decree of the president of the administration on May 11, 1925. The head director was Carlos Jesinghaus, who knew very well the professional selective process that was carried out in the Superior Techniques School in Charlottenburg, built in 1919 by his German colleague Walter Moede (1888–1958). Also, he had released a study trip, in 1924, in which he could internalize in the way of functioning and structure of the psychotechnical similarities with those created in Hamburg, Düsseldorf, Bonn, Leipzig, Dresden, and Berlin (Fingerman, 1926). He came back to Buenos Aires at the end of

1925 in the luxurious Cap Polonio transatlantic, where he met Albert Einstein, who was invited to conferences in Argentina, Brazil, and Uruguay. During his trip, he got the chance to share a table and walk along the ship with Einstein (Calaprice et al., 2015).

Carlos Jesinghaus was the first who wrote about psychotechnics in Argentina (1921), and he did it considering the “psicología aplicada” (applied psychology) and the service production, that is to say, as a derived tool to the work market requirements. If Munsterberg (1863–1916) could not impose the word “psychotechnics” in American lands, Jesinghaus was able to do it in our country with Central European traditions. The documents show that in the following year of its foundation as “Instituto Central de Orientación Profesional – ICOP” (Central Professional Orientation Institute), it was renamed as Psychotechnics and Professional Orientation Institute. This change of name happened little after the creation of the International Association of Psychotechnics (1920) and the First International Conference of the Psychotechnics (1922).

In 1925, the ICOP started to work in a shop of the Industrial School Otto Krause and after a little time, in a Ministry’s shop, situated in Charcas 2218, which had dependence installations. The instruments that Jesinghaus used to accomplish his goals did not have a place in a laboratory and were considered artificial and analytical. He proposed methods that were integral, including polls, observations, professional psychograms, classification of the professions, and fundamentally, the abarcativo process of the thesis and complex situations. To transmit the concepts and practices of that new technology, in 1929 he created the “Escuela de Consejeros Profesionales” (Professional Counselors School) with a total of fifty-six students graduated (Rossi, 2005).

In 1930, Carlos Jesinghaus sent his addition to the second creation of the Society of Psychology. In 1931, after a military *coup d’etat* headed by Jose Felix Uriburu, the budget that the Nation gave to the Institute was suppressed. This administration’s decision led the cessation of the activities and the closure of the Counselors School. But

in that same year, The *Museo Social Argentino* (Social Argentinian Museum) required from the Ministry of Justice and Public Instruction the donation of the material that was part of the suppressed Institute.

Once the material was obtained, on October 1, 1930, the Museum proposed that institute as one of their sections, with the same technical personnel and campus in Maipu 628 in Buenos Aires city. Up to 1934, Carlos Jesinghaus kept fighting for the director position, when he traveled to Germany in order to replace professor Marbe in Würzburg. Annette Mülberger (1994, p. 31) supports the idea that “*After the substitution in his charge, from 1939 to 1945, C. Jesinghaus took over the Marbe park, a man whose convictions adapted very well to the fascist doctrine.*” In the University of Würzburg’s website, it is mentioned that during the 10 years that Jesinghaus was in charge of the Psychology Institute, he never published any work and finally was fired by the government in 1945. After his departure for Germany, Gregorio Fingermann (1890–1972) succeeded him continuing with the original proposal.

In 1948, in another political context both in Argentina and Europe, Carlos Jesinghaus returned to Argentina in order to design the Instituto de Psicotecnia y Orientación Profesional (Psychotechnics and Professional Orientation Institute) at the Universidad Nacional de Tucumán (National University of Tucuman (Rossi, 1997). This time, his stay was short because he died a few months after his arrival, but the institute and the posterior Licenciatura en Psicotecnia y Orientación Profesional (degree in Psychotechnics and Professional Guidance), both implemented in 1950 headed by Benjamín Aybar (1896–1970), constituted a significant antecedent in the professionalization in psychology in Argentina.

Father Álvaro Jiménez S. J. came from a family of seven siblings, six brothers and one sister. Two of his brothers were physicians following their father's footsteps in medicine, who was an ophthalmologist. One of them was a civil engineer,

and three of them including Father Álvaro Jiménez S. J. entered to the Society of Jesus.

Father Álvaro Jiménez S. J. studied at the Escuela Apostólica de Albán [Apostolic School of Albán] in Cundinamarca (Colombia) between 1938 and 1941, and at the end of that same year, he entered the Society of Jesus, where he finished high school at Noviciado de Santa Rosa de Viterbo [Novitiate of Santa Rosa de Viterbo] in 1943. He was ordained priest on December 3, 1956. During his first years in the Society of Jesus, he studied Latin, Greek, literature, history, art, natural sciences, and philosophy. From a very young age, he taught Moral Theology for Jesuits in formation. In 1957, he received his degree in Theology from the Pontificia Universidad Javeriana [Pontifical Javeriana University] and began his involvement in this University lecturing Religious Sciences in some of its schools. In 1961, he obtained a master's degree in Experimental Psychology from Loyola University (USA), and in 1962 he received a doctoral degree in Moral Theology from the Gregorian University in Rome.

He joined the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) in 1963, and in 1964 he became its dean. As dean of the Faculty of Philosophy and Humanities, he received a request from Father Eduardo Briceño S. J. (Vice-Chancellor of the University) to devote special attention to the Departamento de Psicología (Psychology Department). In 1962, this department had received a group of 20 students that marked the beginning of the future Facultad de Psicología (Faculty of Psychology), which became the second program in the country, after the psychology program at the Universidad Nacional de Colombia [National University of Colombia]. In 1966, the Psychology Department became a Faculty, and Father Jiménez S. J. also assumed the deanship of the new Faculty. At the end of his tenure in both deanships (1971), he returned to Loyola University, where he received a Ph.D. in Personality Psychology in 1975.

Father Jiménez S. J. also served as Director of the Psychological Counseling Service at the Pontificia Universidad Javeriana (1975–1981).

Between 1975 and 1977, he was also the Vice-Provost for Student Affairs. Later, between 1983 and 1989, he was appointed Vice-Provost for Academic Affairs at the Pontifical Javeriana University in Cali. During that time, the Cali campus opened the psychology program. After this academic post, the Consejo Episcopal Latinomaericano, CELAM (Latin American Episcopate Council) requested him to lead the Department of Spirituality and Liturgy at the Instituto Teológico Pastoral para América Latina, ITEPAL (Institute of Pastoral Theology for Latin America), a position he held until 1993. He developed psychology and spirituality workshops for different audiences during the following years, especially for priests, seminarians, and nuns.

His psychological training and evangelizing work were permanently coupled with his writing of more than 35 books about psychology and spirituality. His books and some guidelines for a better life were published in Colombia, Mexico, and the United States. His work reflected a deep interest in human behavior and those situations that generate discomfort in people (e.g., sadness, fear, anger, and aggression, among others), and how to process these emotions through spirituality. “And finally, you will inhale the pure air of happiness that brings faith in a kind and provident God who has given you gifts in abundance and who only seeks your complete happiness” (Jiménez Cadena, 2005, p. 7).

Father Jiménez S. J. arrived at the Faculty of Philosophy and Humanities of Pontifical Javeriana University when the first group of psychology students began their second year of studies. He had a significant influence on their education and the discussions on the double psychology condition as a discipline and as a profession. In his initial analysis of psychology in the country, he was concerned about its scientific status, lacking rigor, credibility, and recognition by other professionals. Psychiatrists, in particular, perceived psychologists “as second-class professionals, almost like laboratory technicians who are trained, not to collaborate with them as equal colleagues, but to serve them in the application of tests or for simple tasks in the school field mainly” (Jiménez Cadena, 2012).

His interest in positioning psychology as a discipline with scientific rigor, and the humanistic approach of the *Compañía de Jesús* (Society of Jesus), led him to organize a curriculum in which a solid religious, philosophical, and cultural education coexisted with the precepts of a broad and diverse scientific psychology. It also gathered the academic discussions and debates of the time and included approaches from sciences such as biology, anatomy, and statistics. Thus, Father Jiménez S. J. incorporated the students' research exercise into the curriculum, making evident the scientific status of the discipline and its contribution to the country's problems. The organization of the last year of the program, dedicated to practice, articulated the theoretical body of psychology and its application field. This allowed students to participate in different scenarios and better position psychology and its status in the social context. He had a strong interest in positioning psychology beyond the traditional fields of professional practice (e.g., applying tests). He incessantly worked so that students who carried out their internships in the clinical field would accompany psychiatrists in therapeutic processes, thus promoting the dialogue of knowledge and discouraging the subordination of the discipline to other disciplinary fields. In his academic structure, Father Jiménez Cadena S. J. (1966) projected the Faculty of Psychology with master's and doctoral degrees, which he envisioned with a strong influence in the research field, scientific dissemination, and recognition by peers.

He always worked with a group of professors from different disciplines and postgraduate degrees from foreign universities, who contributed to the epistemological and theoretical debates within the Faculty and outside of it, with the purpose of positioning the psychological discipline in the country. As President and Vice-President of the *Federación Colombiana de Psicología* (Colombian Federation of Psychology) between 1967 and 1969, he urged his colleagues to maintain a permanent dialogue on the status of the discipline and conduct research that would contribute to understanding social phenomena.

The interest in the coexistence of the scientific rigor of psychology, marked by the scientific method for some authors, with the humanistic foundations of the Society of Jesus, which sustains the orientation of the Pontifical Javeriana University, was not a simple matter. This tension transferred to different academic contexts. There was a continuous debate about reconciling the scientific status of psychology (anchored in experimental psychology) with spirituality and faith in God, linked to the inner experience and thus to the concept of the soul.

Father Jiménez S. J. solved this tension, which was not a minor issue, by combining the epistemological and theoretical substratum of the discipline with philosophical training and a humanist perspective, according to Modras (2012), following the Ignatian style (which is still controversial), promoting freedom of speech and human dignity through spirituality, seeking transformations, and enabling the well-being of people, regardless of their religion or faith.

This discussion was not only among psychologists who advocated psychology linked to the study of human consciousness, but also psychiatrists who wondered about the training of psychologists anchored in the relationship with religion. Álvaro Villar Gaviria made critical comments on the education of psychologists from a confessional approach at the VII Congress of Psychiatry. Father Jiménez replied in an open letter: "Javeriana is proud to provide a solid ideological, scientific education, at the university level with a philosophical cosmovision. There is no psychologist (an eminently human and integral professional) who does not profess an ideology, spiritualist or materialist" (Jiménez Cadena, 2012).

Father Jiménez S. J. combined the scientific rigor of the discipline with the precepts of the Society of Jesus. He promoted the positioning of psychology in various contexts, contributed to the visibility of the discipline with a strong social commitment linked to questions and contexts in which psychology should be present, and established research as an essential element in the training process of psychologists.

Irmão Henrique Justo, in civil life José Arvedo Flach, is a Lasallian religious-educator, psychologist, writer, and poet. He is recognized for spreading the pedagogy of Jean-Baptiste de La Salle (1651–1719); for introducing the Person-Centered Approach (ACP) in Brazil; and for working in the organization and consolidation of psychology as a science and profession in Brazil.

Flack was born in Poço das Antas – State of Rio Grande do Sul (RS). His parents were German immigrants. At age 12, he moved to the city of Canoas – RS to study at the *São José Instituto* (Saint Joseph Institute) belonging to the Catholic Brothers of the Christian Schools, a congregation dedicated to education, founded by Jean-Baptiste de La Salle. It was in this institution that he learned the Portuguese language, because until then his language was German as usual in Brazilian German villages in the countryside. In 1939, in accordance with the old tradition of the Catholic Church congregations, he confirmed his Lasallian vocation (ceremony for taking vows), changing his civil clothing for religious garments, being renamed Irmão (Brother) Henrique Justo. The trajectory of Irmão Justo could be characterized by several avenues, which advanced simultaneously.

His orientation as an educator came from La Salle's ethics and from the literature that was arriving in Brazil from Europe and the USA on scientific pedagogy and learning theories. Right after getting the Bachelor of Education, in 1948, he was invited to teach educational psychology at the same institution from which he had graduated. Later, this institution would be known as *Pontificia Universidade Católica do Rio Grande do Sul* – PUCRS (Pontifical Catholic University of Rio Grande do Sul). In 1952, he defended the first doctoral dissertation at PUCRS entitled “La Salle: Precursor of Modern Pedagogy” (Justo 1952). In 1976, he presented at the same university his free doctoral dissertation in psychology, entitled “The Personality of St Jean-Baptiste de La Salle in the Characterology of Heymans-Le Senne.” At that time, Brazilian universities did not offer structured doctoral programs. The title was obtained by submitting a substantial work to a university in the form of a dissertation to be approved by a panel of notables.

Justo became interested in psychology very early in his teaching training at secondary school at the Escola Normal La Salle (La Salle Normal School) – Canoas, RS, which operated in association with the Saint Joseph Institute. As an instructor in the educational psychology at PUCRS, he became the first to introduce scientific psychology. His great interest in scientific psychology led him to attend several seminars, workshops, and internships in different institutions in Brazil and abroad. In Porto Alegre, in 1953, he followed the courses offered by the Freud-Marxist psychoanalyst Béla Székely (1881–1955), and, in 1956, he took the classes offered by the Austrian existential psychoanalyst Igor Caruso (1914–1981). Soon after, he traveled to Barcelona for an internship at the *Instituto de Psicología Aplicada y Psicotecnia* (Institute of Applied Psychology and Psychotechnics) (1956–1957). He took advantage of his stay in Barcelona to participate in other activities in psychology across Europe. Therefore, he went to Brussels for the XV Congress of Experimental Psychology, where he maintained contacts with the Frenchman Henri Piéron (1881–1964) and the Belgian Joseph Nuttin (1909–1988) whose books were studied in Brazil. He went to Germany to visit the Psychology Department at the *Albert-Ludwigs-Universität Freiburg* (University of Freiburg) to talk with psychologists Robert Heiss (1903–1974) and Hildegard Hiltmann (1916–2004). The idea was to discuss psychodiagnostic and interpretive aspects used in Max Pfister's Colored Pyramid Test. Max Pfister (1889–1958) was a Swiss multi-professional who came to psychology after working in architecture, dance, and theater, being very impressed by the effect of colors on people. Heiss and Hiltmann had published in 1951 the first manual for the Pfister test. Ten years later, Irmão Justo returned to Europe, this time to Paris, for a specialization program at the *Association Médico-Psychologique* (1966–1967) under direction of André de Peretti (1916–2017), a psychologist whose work was very close to Carl Rogers (1902–1987) ideas on person-centered education. In 1976, he went to the United States for the Life Centered Therapies and Organization Program

promoted by the Center for Studies of the Person in San Diego, CA, under direction of Carl Rogers. In the following year, he was part of the team that prepared the way for Rogers visit to Brazil (Bandeira 2012).

Justo was very active in groups that articulated the recognition of professional psychology in Brazil. He collaborated for the foundation of the new profession on meetings at the I Brazilian Congress of Psychology held in Curitiba, from December 1 to 7, 1953 (Ginsberg 1954); and at a committee that met to deal exclusively with this matter in Rio de Janeiro, on January 30, 1954 (Ramozzi-Chiarottino 2001). Also, he worked for the foundation of the *Sociedade de Psicologia do Rio Grande do Sul* (Psychology Society of Rio Grande do Sul), which took place in 1959 (Souza 1980).

Another area of his interest was psychometrics. He translated and adapted into Portuguese the Colored Pyramids of Pfister (Justo and Van Kolck 1976/1996), and a complete collection of psychological tests (Logical Intelligence, Visual and Auditory Memory, Numerical Aptitude, Attention; Personality Inventories), prepared in Canada by the *Pedagogia Mont de La Salle de Montreal* (Justo 1955–1960/1996). These publications were widely used by Brazilian psychologists, being updated in successive editions. Justo was a forerunner in Brazil on evidence-based psychological practice, and on encouraging the plurality and diversity of psychological thinking. As director of the PUCRS Institute of Psychology (1976–1981), he developed a program for faculty qualification, sending instructors to obtain doctoral degree in different countries. He regularized the periodicity and transformed the style of *Revista Psico* (Psych Review) giving it the form of a scientific journal. *Psico* was part of the first batch of Brazilian journals in psychology, being published under the auspices of PUCRS (João and Clemente 1997, Justo 1979).

Among the topics published by Irmão Justo, three stood out. Personality theory in the perspective of Carl Rogers (Justo 1973), which was one of the first Brazilian books on Person Centered Approach (PCA). Individual differences (Justo 1997a), in which he drew attention to the common

characteristics of the Brazilian personality, not with the objective of presenting a new classification, but of comparing and criticizing conceptions deriving from psychology and sociology. However, his favorite subject was Rogers' theory; one of his studies had devoted a substantial attention on the controversies surrounding PCA theory and practice (Justo 2002). He rebuts the criticisms on Rogers' humanistic idealism, arguing that the theory does not disregard the social, and his understanding of human nature does not rest on unrealistic grounds. For Justo, the positive development as described by PCA will depend on favorable educational conditions, or in the absence of this, the occurrence of possible resilient reactions. One of his most surprising studies was on the psychologist's identity (Justo 1987/1997b), where he examines the possibilities and limitations of psychotherapeutic techniques and points out paths for the unification of psychology, without disregarding the valuable contributions and differences of the many theories. Justo has been a thinker ahead of his time, and a great teacher for many generations of Brazilian psychologists. At 99, he continued to lecture, supervise research, being able to say the full names of colleagues he had worked with throughout his life.

Brazil · Eugenics · Race · Psychopathology · Eugenics Society of São Paulo

Physician and pharmacist, Renato Ferraz Kehl graduated from Faculdade de Medicina do Rio de Janeiro in 1915; he was responsible for the introduction, in Brazil, of the eugenics, an idea defined in 1865 by the English psychometrist and mathematician Francis Galton (1822–1911) as the science of improving human racial qualities, both physical, as well as psychic and moral. Still a medical student, he became interested in the phenomena of heredity and eugenics, publishing his first work in 1913, attached to a study on August Weissmann. In 1917, he held a conference at the Associação Cristã de Moços (Young Man Christian Association) in São Paulo, and in January 1918, he founded the Sociedade Eugênica de São Paulo – SESP (São Paulo Eugenic Society), the first of its kind in Latin America. Headquartered at the Sociedade de Medicina e

Cirurgia de São Paulo (Society of Medicine and Surgery of São Paulo), it gathered more than 100 associates, among them, important physicians and politicians: Arnaldo Vieira de Carvalho (1867–1920), Luiz Pereira Barreto, Oscar Freire (1882–1923), and Franco da Rocha, psychiatrist who introduced innovative methods in the treatment of mental disorders as well pioneering of the Brazilian psychoanalysis. Among its objectives, SESP foresaw the study and application of eugenics to the “Brazilian race.” The Society published its works on topics such as education, sexuality, psychology and behavior, and hygiene, among others, in the *Annaes de Eugenia* (Proceedings of eugenics), its official periodical publication, which was edited by Monteiro Lobato (1882–1948), main Brazilian author of children’s literature.

SESP was disbanded in as early as 1920, for, among other reasons, Kehl disagreed with the Society’s only hygienist orientation. He then returned to Rio de Janeiro and fought for the Primeiro Congresso Brasileiro de Eugenia (First Brazilian Congress of Eugenia). Encouraged by Miguel Couto (1865–1934), Professor at the Faculty of Medicine of Rio de Janeiro and member of the Brazilian Academy of Letters, the congress was held between 1 and 7 July 1929, chaired by Edgard Roquette-Pinto (1884–1954). The Congress counted on the presentation of several works on psychology, indicating, among its resolutions, the need to establish in Brazil the selection of immigrants with the help of psychological tests,

at the moment a novelty, as a way to bar the entry of “degenerates” in the country. Kehl believed that knowledge about the psychopathology and psychology of individuals and peoples could assist in the conduct of a national policy “racial improvement” of the Brazilian population.

In January 1929, Kehl founded the Instituto Brasileiro de Eugenia (Brazilian Institute of Eugenics), which he renamed as Central Brazilian Commission of Eugenics, in 1931. He had broad support from the Brazilian medical profession, such as Belisário Penna (1868–1939), Octávio Domingues, and the psychiatrists Julio Porto-Carrero, Inácio da Cunha-Lopes (1891–1973), and Ernani Lopes (1885–1969), then president of the Liga Brasileira de Higiene Mental (Brazilian League of Mental Hygiene). Between 1929 and 1933, Kehl was director and editor of the *Boletim de Eugenia* (Bulletin of Eugenia), a monthly periodical for eugenic propaganda in the country. He was a member of the Liga Brasileira de Higiene Mental (Brazilian League of Mental Hygiene).

In his “psycho-criticism,” he described a series of “dysgenic behaviors”, that is, behaviors, typical of the “national soul,” which facilitated the circulation of infections and the proliferation of degenerated characters by the population. His reductionist and deterministic interpretation of the social ills and the backwardness of Brazil as a nation would be that it was due, not exclusively but mainly, to the psychic imbalance typical of its forming races.

He argued: “Modern studies of heredity, constitution and temperament demonstrate, in evidence, that we are all stuck in a organic and psychic fatality which we cannot flee, and that our actions depend, essentially, of our constitution, of our temperament and not the simple influence of the environment and circumstances more or less unforeseen events” (Kehl, 1958b, p. 39).

He was a member of the Academia Nacional de Medicina (National Academy of Medicine), the Brazilian League of Mental Hygiene, the Mexican Society of Eugenia, and the Eugenics Society of London, among others. He published many articles in Brazilian and international magazines and more than twenty books, always under the

influence of eugenic doctrine, in which he defended the thesis of heredity of acquired psychological and moral characteristics, an influence of neo-Lamarckist theories.

After the Second World War, these ideas went into serious decline not only due to scientific imprecision, but also because they subsidized totalitarian governments and absurdly violent practices, in an attempt to promote “racial hygiene.”

His importance for the history of psychology is due more to his moral and racial interpretation of the already consolidated concepts, such as personality, intelligence, and character, than to his investigations in the area. In this sense, he tried to place the psychological knowledge produced so far at the disposal of the supposed possibility of improving the “national race.”

Hernán Kesselman graduated as a medical doctor at the University of Buenos Aires and also got his degree in psychiatry at the same university. He took part in the movement that organized the mental field since 1950, and he was considered disciple of the renowned Mauricio Goldenberg (1916–2006), and Enrique Pichon-Rivière (1907–1977). Even before getting his physician degree, Kesselman contacted Goldenberg, who was elected in 1956, after a public selection head of the Servicio de Psicopatología del Policlínico Dr. Gregorio Araoz Alfaro (Psychopathology Service at the Polyclinic). Because the psychopathology service was located in Lanus, a suburb 20 minutes from downtown Buenos Aires, it was

known simply as “the Lanus” (Visakovsky, 2002). In “the Lanus,” Goldenberg pioneered a core experience for the development of mental health in Argentina by providing treatment for mental disorders in a General Hospital. Kesselman started working there in 1957, first at the hospitalization room of the General Hospital, and afterward as the Chief of the Teaching Department. He founded and directed the first psychiatric residency of this service and finally took charge of the Community Psychiatry program toward the end of 1960. However, he left the service in 1968 due to ideological differences. In a growingly politicized society, he had started to get involved with the peronist party. Goldenberg had managed a grant from the Ford Foundation for the service, and Kesselman was supposed to travel to the United States to specialize in community psychiatry. Feeling ideologically displeased, he resigned quietly from the service, in order to avoid hampering Goldenberg (Carpintero & Vainer, 2018).

By the same time, he had started his training as a psychoanalyst at the Asociación Psicoanalítica Argentina (Argentine Psychoanalytic Association), where Marie Langer (1910–1987) was his training analyst and José Bleger (1922–1972) his supervisor analyst. Kesselman became associate member of the association. He was also trained as a psychoanalyst, group, and social psychologist by Enrique Pichon-Rivière, whom he met in 1960 while attending his lectures at the Primera Escuela de Psicología Social (First Social Psychology School) (Zito Lema, 1976). Also during that decade, he was second editor-in-chief of the journal *Acta Psiquiátrica y Psicológica de América Latina* (Psychiatric and Psychological Journal of Latin America).

In accordance with the political times marked by both the French May 1968 and the Argentine Cordobazo, in 1969, during the International Congress of Psychoanalysis in Rome (Italy), he participated in the foundation of Plataforma Internacional, together with Armando Bauleo (1932–2008) and others. This group held a sort of *countercongress* questioning professional training and function of psychoanalysts in capitalist society. Back in their country, they organized the Argentine

branch. This group, together with *Documento*, another group that questioned the psychoanalytic institution, resigned from the International Psychoanalytic Association for ideological reasons in November 1971 (Langer, 1971). His first book, *Psicoterapia Breve* (Brief Psychotherapy) (Kesselman, 1970), condensed his clinical and political positions. His idea was to suggest a suitable approach for the hospital setting considering the experience at Lanus Hospital, his psychoanalytical background, his studies with Pichon-Rivière, as well as his ideological convictions. He also developed a theory and a practice about *Corrective Processes of Limited Duration and Objectives* along with the necessary planning for these treatments, either individually or in groups, as well as a number of mobilization techniques and therapeutic resources resulting from social laboratories and psychodrama.

In the mid-1970s, he started cocoordinating groups along with Eduardo Pavlovsky (1933–2015). Together, until the end of their lives, they configured a work team with theoretical and clinical developments. Their books were born from training experiences for psychotherapists and group coordinators. The most important contributions can be found in *Las escenas temidas del coordinador de grupos* (The Fearful Scenes of the Group Coordinator) (Kesselman et al., 1978), and *La multiplicación dramática* (The dramatic multiplication) (Kesselman & Pavlovsky, 1989). In both texts, the authors focused on the training of group psychotherapists as well as innovative working techniques, based on psychoanalytical psychodrama.

Kesselman went into exile to Madrid (Spain) during the last military dictatorship, where he founded the *Escuela de Psicología Social en España “Dr. Enrique Pichon-Rivière”* (Social Psychology School Dr Enrique Pichón-Rivière). Together with Pavlovsky, he organized the training of group therapists called *análisis didáctico grupal* (didactic group analysis) from 1978 to 1980 (Kesselman & Pavlovsky, 1980).

Kesselman returned to Argentina in 1987, where he founded the Centro de Psicoterapia y Técnicas Operativas (Psychotherapy and Operative Techniques Center), where he continued working with his clinical, theoretical, and

specially teaching activities, teaching original models of group work. The two volumes of *La psicoterapia operativa* (Operative Psychotherapy) (Kesselman, 1999) are a summary of his contributions in the group field, psychotherapies, and ways of training psychotherapists and group coordinators.

Brazil · School psychology · Professional entities

Yvonne Khouri graduated from the Faculdade de Saúde Pública da Universidade do Estado de São Paulo (Faculty of Public Health of the University of the State of São Paulo) (USP) in 1945 and graduated from the Faculdade de Filosofia Ciências e Letras (USP) (Faculty of Philosophy, Science and Letters) in 1953. She completed the specialization course in Clinical Psychology at the Pontifícia Universidade de São Paulo (PUC-SP), (Pontifical University of São Paulo), in 1959, when she became the head chief of the department of Clinical Psychology in the Serviço de Assistência ao Escolar do Departamento de Educação, Assistência e Recreio, da Secretaria de Educação e Cultura (Assistance Service of the Department of Education, Assistance and Recreation, of the Department of Education and Culture) of the city of São Paulo. With the regulation of the profession of psychologist in Brazil, in 1962, Yvonne Khouri obtained the registration of psychologist n°. 1042, conferred by the Conselho Regional de São Paulo (Regional

Council of São Paulo) (CRP/06), in 1975 (Khouri, 2002).

In 1975, Yvonne Khouri completed her doctorate degree in Educational Psychology at PUC/SP, with the thesis “Study of the personality of preschool children of different socioeconomic status, using the Z test” (APP, 1978; Khouri, 2002).

She carried out a survey in 1974, with the objective of defining the school reality and its needs. It involved 1184 children and was based on data obtained from interviews with the parents of children who received assistance from the Psychological Clinics as well as from teachers’ reports. She found that the so-called schooling disorders, which corresponded to 80% of referrals, could be prevented or minimized through action of the psychologist at school.

The following year, she carried out the research *Assessment of the intellectual development of first grade students of first grade education at PMSA and its relationship with school failure*, demonstrating the need to adapt educational programs, and methodologies and prophylactic actions in the students and families’ mental health and the school as an institution. Besides maintaining the Clinical Psychology Service for students in need of psychological diagnosis and psychotherapy, Khouri, based on the performed studies, proposed the School Psychology Pilot Project to the Department of Education, which was approved and installed in July 1975 (APP, 1978; Khouri, 1984, 2002).

In 1978, the School Psychology project was expanded to include 80 psychologists who worked in approximately 160 first grade and early childhood education schools. This year, she founded the Association of Psychologists of the São Paulo City Hall (APP), of which she was president (APP, 1978; Khouri, 1984). She retired from this institution in 1979 (Khouri, 2002).

Yvonne Khouri began her teaching career at PUC/SP in 1963 at the Education Center. She took over its direction for two terms and was a representative on the University Council, the highest decision-making body of the university. From 1977 to 2000, she was the chief head of the Department of Education Technology and supervised dissertations and theses in the Graduate

Program in Education and Curriculum (Khouri, 2002).

During the 1980s and 1990s Yvonne Khouri participated in the Sistema Conselhos (System of Councils), acting both in the Regional Council of Psychology of São Paulo (CRP-SP) and in the Federal Council of Psychology (CFP). She planned and collaborated in the performance of the Meetings of Psychologists in the Field of Education, at Instituto *Sedes Sapientiae* (*Sedes Sapientiae* Institute), in São Paulo. The first Meeting, held in 1980, already raised issues for critical thinking about school psychology, within a collective of psychologists. The second and third Encounters took place in 1981 and 1982, respectively. The annals of each Encounter were published, respectively, in 1981, 1982, and 1983. This movement was considered as a pioneer in the organization of school and educational psychologists in São Paulo (Federal Council of Psychology; Regional Council of Psychology 6th Region, 1994; Prates, 2015).

In 1986, she participated in the development and publication of the book *Psychology in High School Education: An Emancipatory Proposal*, by the CRP-SP Education Commission and the São Paulo State Psychologists Union (Regional Psychology Council 6th Region; Union of Psychologists of the State of São Paulo, 1986). She became the chief head of the CRP-SP, in a period of political organization of the category, contributing to the realization of the first National Congress of Psychology – first CNP, in 1994 (Conselho Regional de Psicologia 6ª Região (Regional Council of Psychology), 1994).

At the Federal Council of Psychology, she was a member of the Chamber of Education and Professional Training, which carried out a survey on the practice of psychologists, resulting in the book “Brazilian Psychologist: Emerging Practices and Challenges for Training,” published in 1994.

Yvonne Khouri’s path as a psychologist in the São Paulo City Hall, a research professor at PUC/SP, and a participant in the representation bodies of psychologists (CRP/SP and CFP) has been inserted in the Psychology movement in São Paulo since the mid-1950s. However, her contribution to the implementation of the pioneering

project in School Psychology in the city of São Paulo in 1975 deserves outstanding remarks, as it came out to be a challenge, as it confronted the direction given by psychology at the time. In 1984, she organized a book on School Psychology, besides being the organizer, the author of the preface, three chapters, and the conclusion. In this book, her ethical and political position regarding the issues of a dehumanized and mechanistic education is evident, and she states the need for a clear definition of the psychologist’s contribution to education. Yvonne Khouri leaves to the next generations a legacy of struggle for the construction of a Psychology marked by the defense of the rights of the most vulnerable segments of the Brazilian population.

Otto Klineberg was born in Quebec to a middle-class Jewish family from Europe that migrated to Canada in the nineteenth century. He was raised in Montreal, where he started his university studies in Philosophy, Psychology (Bachelor of Arts, 1919), and Medicine at the McGill University (Medical Degree, 1925), because he wanted to be a psychiatrist. He obtained his master's degree at Harvard University in 1920 (Master's Degree in Philosophy), and his Doctor's Degree in Psychology at Columbia University, in 1927 (Ph.D. in Psychology), later becoming a professor and occupying several positions in this institution (1931–1962). At Harvard, he became familiar with the research in the field of social psychology by Floyd Allport (1890–1979), and at Columbia University, he was the student of the anthropologists Franz Boas (1858–1942), Edward Sapir (1884–1939), and Ruth Benedict (1887–1948). These academic experiences were decisive for the establishment of the dialogue between cultural anthropology and social psychology in his works. He was a visiting professor at some university institutions, such as the University of Hawaii (1958), Faculté des Lettres et des Sciences Humaines (Faculty of Letters and Human Sciences) (1962–1965), and École Pratique de Hautes Études (Practical School of High Studies) (1965), both at Université de Paris (University of

Paris), in France. Since he had worked for around 40 years in the United States, he was mistakenly known as an American social psychologist, even though he preferred to call himself, in his autobiography, an international psychologist with a Canadian origin (Klineberg, 1973). He was a researcher in several countries: Italy, France, Germany, China, and Brazil. He carried out studies in anthropology under the influence of the works of his professor Franz Boas, following his culturalist model, and he was also influenced by the studies of Bronisław Malinowski (1884–1942) and Ruth Benedict (Bomfim 2003).

His initial research aimed at problematizing the theme of racial differences, especially around the belief at the time of a direct relationship between intelligence and racial belonging. In this sense, he questioned the racist interpretations of the experimental psychologist Carl Campbell Brigham (1890–1943), who was famous at the time for the publication of his book *A Study of American Intelligence* (1923). Klineberg's critique is clear in his thesis defended in 1917 and published soon after that, in which he approaches the difference in performance among white, black, and indigenous students, and the role of the socio-economic and educational factors in distortions of results from intelligence tests, since they do not take into consideration social and cultural matters. Afterward, he continued verifying his hypothesis in a research carried out in Germany, France, and Italy (1927–1929), which was also published. Continuing these same theoretical and methodological principles, he published the result of research based on the application of tests and the analysis of black students' school records in the Southern and Northern regions of the United States. In this paper, he emphasized the role of culture, which made him propose that the fundamental mindset differences from different races were due to the sociocultural environment and were not derived from racial factors. He also published another book, which is a synthesis of his discussions about the mistaken importance given to intelligence tests for the determination of the subjects' psychological skills. With the consolidation of his professional career in the realm of social psychology, he also published a

textbook on *Social Psychology*, focused on the introductory debate of the main topics from this area, in which he analyzes the influence of social factors in human nature, the ethnic differences, the importance of differential psychology and the relevance of the social interaction process. This book was published in Brazil in 1959, being considered one of the first social psychology manuals translated in the country, where there were already some books by national authors, such as Raul Bricquet (1887–1953) and Arthur Ramos (1903–1949).

His studies led him to the statement that Psychology did not have justifications to believe in a racial hierarchy of skills. In his papers about intelligence tests, he blatantly refused the racialist theories of the time, criticizing the use of such psychometric models for the affirmation of racial hierarchies.

He had been in Brazil as a visiting professor at the University of São Paulo (1945–1947), invited by the biologist and physician André Dreyfus (1897–1952) with the intermediation of another professor of USP, the Ukrainian geneticist and biologist, Theodosius Grigorevich Dobzhansky (1900–1975). During his stay at USP, he taught classes from the Psychology chair at the School of Philosophy, Sciences, and Letters (FFCL-USP), such as General Psychology, Schools and Psychological Systems, Social Psychology, Differential Psychology, Pathological Psychology, among others. During his stay, he received the support of the psychologist Annita de Castilho e Marcondes Cabral (1911–1991) as his assistant. He actively participated in the qualification of the first psychologists of São Paulo, assisting them in the creation of the Society of Psychology of São Paulo in 1945, from which he was an active participant – and it may be verified by his presence as the 1st vice-president (1945–1947) and president (1947–1948) of the association. Some of his books were published in Brazil, with highlights to a textbook on Social Psychology. He organized a book with several other professionals from different areas related to the field of psychology (physicians, psychologists, psychoanalysts, physiologists, and ethnologists), such as Aniela Ginsberg (1902–1986), Annita Cabral, (1911–1991),

Cicero Christiano de Souza (1914–1980), Durval Marcondes (1899–1981), Herbert Baldus (1899–1970), M. B. Lourenço Filho (1897–1970), and Oswaldo de Barros Santos e Virginia Leone Bicudo (1910–2003). This book was the result of his perception of the “need for a text in Portuguese to provide the students with a general introduction to the psychological science” (Klineberg, 1953, n/p), according to the comment he wrote in the preface of the book, which encompassed a variety of topics (psychology schools and systems, animal psychology, mental hygiene, children’s psychology, ethnic psychology, etc.)

He had brief passages at UNESCO as Interim Director of projects of the Department of Social Sciences (1948–1949) and as head of the Division of Applied Social Sciences (1953–1955). The board of the Department of Social Sciences at UNESCO, temporarily occupied by Klineberg was, according to his referral, directed afterward by Arthur Ramos in 1949, whose work focused on racial issues was famous since mid-1940. However, the direction of Ramos lasted only 2 months, since he passed away suddenly in October 1949. As Interim Director of projects, Klineberg participated in the UNESCO Project, carried out in Brazil, approved during the 5th session of the General Conference of UNESCO (1950). As a consultant to the UNESCO Project, Klineberg directly took part in the nomination of the psychologists Aniela Meyer Ginsberg, Betti Katzenstein, Cicero Christiano de Souza, and Virginia Leone Bicudo to take part in the project, since they have demonstrated interest regarding the investigation of the psycho-social aspects of racial relations in Brazil. Influenced by the idealized view that the American intellectuals had of the harmonic racial relations in Brazil, which is extremely influenced by the work of Gilberto Freyre (1900–1987), he saw research in the country as a great opportunity to understand the vicissitudes of racial conflicts, because he considered Brazil a “big racial laboratory,” more mixed and less jaundiced (Maio, 1997, 2000, 2017).

He had a relevant participation in the International Union of Psychological Science (IUPsyS), where he was a member of the Executive Committee (1951–1954; 1963–1969), the Secretary-

General (1954–1960), and the President (1960–1963). It is also relevant to mention that the acceptance of the Brazilian Association of Psychologists (ABP) as representative of Brazil at IUPsyS counted on the capital intervention of Klineberg and the help of psychologist Carolina Martuscelli Bori (1924–2004). This participation started at the Moscow International Congress of Psychology (1966), with Aniela Meyer Ginsberg as the first representative of the country (Ginsberg, 1975, p. 83). He was also the president of the World Federation for Mental Health (1966–1967) (Ginsberg 1975). From his contributions to international relations, we can mention the books *Social Implications of the Peaceful Uses of Nuclear Energy* (1964b), organized by him and edited by UNESCO, and *The Human Dimension of International Relations* (1964a), published by the publishing house Holt, Rinehart and Winston (HRW).

He received several awards for his contributions to psychology from several institutions, such as: Honorary PhD for his work advancing racial equality (Universidade do Brasil, 1958); Butler Medal (Columbia University, 1950); Kurt Lewin Memorial Award (Society for the Psychological Study of Social Issues – SPSSI, 1956); Honorary PhD (Howard University, Washington DC, 1961); Professor Emeritus of Social Psychology (Columbia University, 1962); Honorary PhD (Drew University, Madison, 1972); Contribution by a Psychologist in the Public Interest Gold Medal Award – APA (Annual Meeting of the APA, Los Angeles, California, 1985); and APA Award for Distinguished Contributions to the International Advancement of Psychology (Committee on International Relations in Psychology – CIRP/APA, 1991) (Chapman 2002).

The contributions of Otto Klineberg to Brazilian psychology are undeniable, especially for social psychology, since he directly took part in teaching and research activities focused on the area, besides participating in the organization or creation of psychology institutions. But his main highlight is the introduction of a new bias for racial issues in psychology.

Knobel, Mauricio

Born *in Buenos Aires City, Argentina, March 19, 1922*

Died *in Campinas, Brazil, August 22, 2008*

Nancy Edith Vadura and María Laura Fernández
Universidad Nacional de La Plata, La Plata,
Argentina

Keywords

Argentina · Brazil · Child psychiatry ·
Psychology · Psychoanalysis

Mauricio Knobel studied medicine at the Universidad de Buenos Aires (Buenos Aires University) (hereinafter UBA).

Initially, he focused on medical clinic, electroencephalography, neurology, and psychiatry.

Later, between 1956 and 1959, he specialized in psychiatry and child psychiatry in Greater Kansas City Mental Foundation, Missouri (Knobel, 1987; Dagfal, 2009).

He joined the Asociación Argentina de Psicoanálisis (Argentine Psychoanalytic Association) (hereinafter APA) between 1961 and 1964 where he became a didactic analyst. However, he was not a classic representative of Argentine psychoanalytic orthodoxy; on the contrary, he believed that “one of the problems for psychoanalysis is a bit of dogmatism” (Fendrik, 2006, p. 111).

The hospital work was a great incentive for his therapeutic concerns, a task that he developed at the Melchor Romero Psychiatric Hospital in La Plata, where he played an important role as a physicians and psychologists trainer (Knobel, 1987).

His work as a professor was not limited to clinical practice education. In 1961, it was summoned by Dra. Fernanda Monasterio (1920–2006), director of the undergraduate Program in Psychology at the Universidad Nacional de La Plata (National University of La Plata) (hereinafter UNLP), to be appointed as Full Professor in the courses of Differential Psychology and Psychology of Childhood and Adolescence and as Associate Professor of Mental Hygiene one year later (Vadura, 2016a).

He was also Director of the Research Institute from 1965 to 1968. The relevance that he gave to investigation became visible in the articles published in the UNLP *Revista de Psicología* (Journal of Psychology) (Klappenbach, 2008) as well as in the presentation of reports and works of his teams in national and international scientific meetings (Vadura, 2016b).

In 1966, his institutional participation, in the undergraduate Psychology Program at UNLP, prompted him to present a preliminary draft to modify the curriculum. His goal was to build a discipline in accordance with the scientific reality of the world and to change the professional profile of the Psychology Program. This proposal led in later years to the modification of the curricula of the program (Fernández & Vadura, 2017).

In 1968, he returned to the UBA as Associate Professor of the course of Clinical Psychiatry at the Facultad de Medicina (Faculty of Medicine) between 1969 and 1977 and as Head in charge of the course of Childhood and Adolescence Developmental Psychology in the undergraduate Psychology Program at the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) between 1970 and 1976. By then, Knobel was a significant reference in the academic community. For this reason, in March 1975, he was appointed by Dr. Haydeé Longoni (1911–2011), Interventor of the Facultad de Humanidades y Ciencias de la Educación (Faculty of Humanities and Education Sciences) at the UNLP, to organize and restructure

once again the undergraduate Psychology Program (Knobel, n.d.; Fernández & Vadura, 2017). In that year, he also was appointed Interim Head of Department of the Psychology Area. Finally, in a context of intervention from the national administration to the national universities, the project remained unfinished and Knobel resigned from his appointment.

The military coup d'état of March 24, 1976, imposed state terrorism in the country. In this context, Knobel was expelled from the University and had to go into exile. He accepted the invitation of the Rector of the Universidade de Campinas (University of Campinas) in Brazil, to reorganize the Department of Medical Psychology and Psychiatry in the Faculdade de Ciências Médicas (Faculty of Medical Sciences) (Sorrentini & Rozenbaum, 2003).

As Director of that department, he developed an area of child psychiatry, created the Center for Student Care and Psychology Studies from where he promoted researches in such field. He also founded the Centro de Prevenção de Suicídios (Suicide Prevention Center). In 1977, he was designated as Professor of the Department of Graduate Studies in Clinical Psychology at the Universidade Católica de Campinas (Catholic University of Campinas).

In 1985, he became a Brazilian citizen. His activities in this country were suspended when he had to retire in 1992. However, he continued to be called as a visiting professor, and in 1993 he received the title of Professor Emeritus at Universidade de Campinas (University of Campinas) (Vella, 2019).

At the institutional level, throughout his career he was President of the Sociedad Argentina de Psiquiatría y Psicología de la Infancia y de la Adolescencia (Argentine Society of Children and Adolescents Psychiatry and Psychology) and Director of the Instituto de Orientación Familiar (Family Orientation Institute), created by himself in Buenos Aires, which currently carries his name (Knobel, 1987). He was also a member of the Asociación Médica Argentina (Argentine Medical Association), the Sociedad Interamericana de Psicología (Interamerican Society of Psychology), and Head of Department of Social Psychiatry at the

Instituto de Salud Mental (Institute of Mental Health) (Klappenbach, 2008). In Brazil, he joined the Associação Brasileira (Brazilian Association) and the Comisión Asesora de Saúde Mental do Estado de São Paulo (Advisory Commission of Mental Health of the State of São Paulo) (Vella, 2019). In 2002, the American Psychiatric Association recognized him with the International Fellow category for his high international prestige. He was honored as a Post-Mortem Honorary Professor in 2011 at the UBA (Sorrentini & Rozenbaum, 2003).

His extensive work includes approximately 400 written texts and 12 books, from where he made important contributions to child psychiatry, brief psychotherapy, and the *syndrome* of normal adolescence (Klappenbach, 2008). His conceptualizations of adolescence were deepened in *La adolescencia normal. Un enfoque Psicoanalítico* (Normal adolescence. A Psychoanalytic Approach), a publication he coauthored with Arminda Aberastury (1910–1972) (Aberastury & Knobel, 1971). Knobel recognized this psychoanalyst as one of his great teachers (Knobel, 1987) and who introduced the children and adolescents psychoanalysis in Argentina and Latin America (Sorrentini & Rozenbaum, 2003).

He developed his outstanding vocation for research until 2000. Many of his publications and works showed him as a professional committed to the community, interested in contributing to the general well-being of a freer, fairer, and more humane society (Knobel, 1987). He died at the age of 85.

Brazil · Psychoanalysis · Creation of professional associations

The German psychoanalyst Adelheid Koch graduated as a doctor in 1924 from the University of Berlin and obtained her doctorate in 1927 with a thesis on the infant mortality of illegitimate children. She began her psychoanalytic training at the *Berliner Psychoanalytische Institute* [Berlin Psychoanalytic Institute] in 1929 having done didactic analysis with the Austrian Otto Fenichel (1897–1946) and supervision with the Polish Salomea Kempner (1880–1940).

However, in December 1935, under pressure from the Nazi government after the enactment of the Nuremberg Racial Laws, all Jewish members of the *Deutsche Psychoanalytische Gesellschaft* [German Psychoanalytical Society] (DPG) were banned at a meeting chaired by Ernest Jones (1879–1958), then president of the International Psychoanalytical Association (IPA). This controversial process became known as the “rescue of psychoanalysis,” since it aimed at reconciling Nazi pressures and safeguarding the continuity of psychoanalytic activities in that country (Drager, 1985) – which proved to be unsuccessful. Thus, in this period, Koch’s affiliation as an analyst was not recognized by the local society – as was the rule – but directly by the IPA (Oliveira, 2014; Russo, 2002).

In 1936, Koch was forced by the government to leave Berlin. It was then that Jones informed Koch of the existence of a group of people interested in analytic training in São Paulo, led by the psychiatrist Durval Marcondes. Marcondes had already initiated a self-taught practice in psychoanalysis, as well as created the *Sociedade Brasileira de Psychanalyse* [Brazilian Psychoanalytic Society] in 1927, dedicated to the dissemination of this knowledge (Sagawa, 2001). Thus, in December 1936, Koch arrived in São Paulo, being the first psychoanalyst to emigrate to Latin America.

After 6 months of adaptation, in July 1937 Koch began to practice psychoanalysis in São Paulo. The initial group of candidate analysts included physicians Darcy de Mendonça Uchoa (1907–2003), Flavio Rodrigues Dias (1899–1994), and Durval Marcondes himself, in addition to educator Virginia Leone Bicudo (Pacheco Filho, 2001). It is noteworthy that psychoanalysis in São Paulo was, since the initial steps of its institutionalization, open to the so-called “lay analysis,” that is, to nonmedical people. It also draws attention to the presence of Bicudo, a young black woman in a mostly male and medical intellectual circle (Gomes, 2013; Haudenschild, 2015).

Koch also acted as Marcondes’ assistant in the chair of Psychoanalysis, created by him, at the *Escola Livre de Sociologia e Política* [Free School

of Sociology and Politics] of São Paulo (1939–1941). She also collaborated with Marcondes at the *Serviço de Higiene Mental Escolar* [School Mental Hygiene Service], of São Paulo, teaching lectures on psychoanalysis to female teachers, as well as in other dissemination initiatives.

Under Koch’s leadership, who was responsible for all the stages of the formative tripod (didactic analysis, supervision, and theoretical seminars), the *Grupo Psicanalítico de São Paulo* [São Paulo Psychoanalytic Group] was created on June 5, 1944 (Massi, 2001), obtaining official recognition as a study group by the IPA in 1945. After meeting the requirements, the IPA recognized in 1951 the *Sociedade Brasileira de Psicanálise de São Paulo* [Brazilian Psychoanalytic Society of São Paulo] (SBPSP), the first society in Brazil to obtain such recognition (Oliveira & Massi, 2011).

Adelheid Koch played an extremely significant role in the institutionalization of psychoanalysis in Brazil. Her great contribution was in the SBPSP, where she worked as a training analyst until the mid-1960s. She was a great master, directly present in the formation of the first generations of psychoanalysts in São Paulo: Besides those mentioned above, Frank Phillips (1906–2004), Lygia Alcântara Amaral, and Judith Andreucci (1913–2001) stand out.

Uruguay · Psychoanalysis · Lacan · Klein

Gijsbert (Gilberto) Koolhaas Jurgens was born in The Hague (Netherlands) on 9 March 1912. He also lived in Germany and Belgium. In 1930 he entered Leiden University to begin his studies in medicine, a degree he got in 1937.

As Javier García (1994) recounts, in 1938 he traveled to Buenos Aires with his mother for family reasons. In this trip he met who would become his wife, and, soon after, he settled in Montevideo (Uruguay). García (1994) describes Koolhaas's career and formative path from his arrival in Uruguay onward: He traveled to Paris, where he trained in psychiatry; then, in Montevideo, the revalidation of the medical degree demanded him to take exams in all the career subjects, which he completed in 1945. During the years 1945 and 1946 he was adjunct for Prof. Dr. Sicco's (1894–1949) Psychiatric Clinic. After that, during the years 1947 and 1948, he was honorary physician in the psychiatric clinic. Then, in 1949, he started to work as an assistant physician in Hospital Vilardebó (Vilardebó Hospital) and in Colonia Etchepare (Etchepare Colony) (García, 1994, p. 12).

During this trajectory he met Valentín Pérez Pastorini (1895–1948)—pioneer of psychoanalytic practice in Uruguay—and the group of psychoanalysts in training that agglutinated around him. With him Koolhaas carried out his first personal analysis—later on he was in analysis with Willy Baranger (1922–1994) and, finally, with Madeleine Baranger (1920–2017). As of 1948,

after the death of Pérez Pastorini, Koolhaas and Rodolfo Agorio (1903–1990) moved on to occupy a leadership role in the group: “we felt that psychoanalysis had passed from V. Pérez’s hands onto theirs” (Freire de Garbarino, 1988, p. 5).

In 1952 Koolhaas published his first psychoanalytic article in *Revista de Psiquiatría del Uruguay* (RPU) (Uruguayan Journal of Psychiatry). It was a clinical case titled “Psicoanálisis de una perturbación visual” (Psychoanalysis of a visual perturbation), and in it a Kleinian influence already starts to sketch out. That same year, Hanna Segal (1918–2011)—one of Melanie Klein’s (1882–1960) main disciples—had visited Montevideo, supervising various analysts of the Uruguayan group.

In 1955 the Asociación Psicoanalítica del Uruguay (APU) (Uruguayan Psychoanalytic Association) gets founded by Rodolfo Agorio, Gilberto Koolhaas, Héctor Garbarino (1918–2001), Mercedes Freire de Garbarino (1918–2008), Laura Achard (1920–2008), Juan Pereira Anavitarte, Juan Carlos Rey (1918–2008), Miguel Sesser, Marta Lacava, Willy Baranger, and Madeleine Baranger. Six years later, in 1961, APU finally acquired the Component Society level according to the International Psychoanalytical Association’s (IPA) rules. Koolhaas was the first director of the *Revista Uruguaya de Psicoanálisis* (RUP) (Uruguayan Journal of Psychoanalysis), official journal of the APU which was created in 1956.

In the beginning, psychoanalysis in Uruguay—particularly since its institutionalization—was developed with a marked influence of the Kleinian school. Therefore, in those early days, Koolhaas and the rest kept a strong proximity with Klein’s thought, a trait that is noticeable in his publications. But later on, in the 1970s, he dedicated to the systematic study of Lacan’s work and was one of the main protagonists in the reception of the Lacanian ideas in Uruguayan psychoanalysis (Bernardi, 2010; Capó, 2010; Grau-Pérez, 2018). Koolhaas’s work can be split into two stages: a “Kleinian stage” between 1952 (the year of publication of his first psychoanalytic article) and 1966 (the year of publication of his last purely Kleinian article), and a “Lacanian stage” between

1972 (the year of publication of his first article about Lacan) and 1994 (the year of his death) (Acevedo de Mendilaharsu, 1994; Grau-Pérez, 2018). Between these two stages we can find an interval of a few years in which there are no publications; it reaches its end in 1972 with the publication of the article titled “¿Quién es el Otro?” (Who is the Other?) in the RUP. In this article the author “documents, testimonial and fehacently, his shift to Lacan” (Capó, 2010, p. 120).

Since the 1970s, he coordinated curricular seminars about Lacan’s work for APU candidates. Nonetheless, his relation with Lacanism was not limited to the institutional ground of the IPA. He kept close contact with the Grupo Freudiano de Trabajo (GFT) (Freudian Working Group), a group dedicated to the study of Lacan that was integrated by analysts that did not belong to APU. Later on, in 1982, they would found the Escuela Freudiana de Montevideo (EFM) (Freudian School of Montevideo), the first Lacanian institution in Uruguay. Koolhaas, who had been the analyst of some members of this group, participated in the first work seminar organized by the group in 1981, and he published in the first volumes of the *Cuaderno de psicoanálisis freudiano* (Journal of Freudian Psychoanalysis), official publication of GFT and of the later EFM. He also was in contact with the Escuela Freudiana de Buenos Aires (Freudian School of Buenos Aires) and with other Argentinian Lacanian institutions—like Mayéutica, where he presented one of his works in 1979.

Philosophy occupies a prominent spot in Koolhaas’s work; in particular, the philosophy of Husserl (1859–1938) and Heidegger (1889–1976), although there are also references to Hegel (1770–1831), Merleau-Ponty (1908–1961), and Sartre (1905–1980), among others. Koolhaas came to dominate various languages (Dutch, German, French, English, Italian, and Spanish), which provided him the possibility to read many authors in their original language and at the same time to attend various foreign patients. He fulfilled a prominent role in the institutionalization of psychoanalysis in Uruguay, and, in particular, in the process of reception of Lacanian ideas. His work constitutes a paradigmatic case of Klein-Lacan transition (Grau-

Pérez, 2018), a theoretical movement that many other psychoanalysts in Latin America gone through at that time.

In 1877, Alejandro Korn began high school at Colegio Nacional Buenos Aires (Buenos Aires National High School) and then pursued his studies at the Facultad de Medicina de la Universidad de Buenos Aires (Faculty of Medicine of the University of Buenos Aires). He obtained his medical doctor degree in 1882 with a thesis on *Locura y Crimen (Insanity and Crime)*, Korn 1883). He practiced medicine in the small towns of Navarro and Ranchos, both an hour away from his birthplace and then in the city of La Plata, the capital of the Province of Buenos Aires, the richest province in the country. While he was still a student, he assisted the wounded of the 1880 revolution. From his youth, he devoted himself to study, and at a young age he grew intellectually in the silence of his library. This is how he developed a solid self-taught culture that led him to the teaching of philosophy. The writings of Henry Bergson (1859–1941), Emile Boutroux (1845–1921), Charles Renouvier (1815–1903) and later Descartes (1596–1650), Kant (1724–1804), and St. Augustine (354–430) shaped his philosophical vocation (Pro, 1967).

His teaching activity began at the Colegio Nacional de La Plata (National High School of La Plata), as a professor of natural sciences (1888–1896). He was appointed Professor of History of Philosophy (1906) and Gnoseology and Metaphysics (1923), at the Facultad de Filosofía y

Letras de la Universidad de Buenos Aires (Faculty of Philosophy and Humanities at Buenos Aires University). At the Facultad de Humanidades y Ciencias de la Educación de la Universidad Nacional de La Plata (Faculty of Humanities and Educational Sciences at the National University of La Plata), Korn was appointed professor of the History of Philosophy course (1914–1930). He also served on the boards of both universities. In addition to his university work, he was the founder of many other institutions such as Colegio Libre de Estudios Superiores (Free School of Higher Studies), Sociedad Kantiana (the Kant Society), Escuela de Estudios Sociales Juan B. Justo (School of Social Studies Juan B. Justo) in Buenos Aires, and Centro de Estudios Filosóficos de La Plata (Centre of Philosophical Studies of La Plata).

In 1888, he was appointed police physician. After settling down in La Plata, on November 2, 1897, he became the Director of the Hospital Provincial de Melchor Romero (Provincial Hospital of Melchor Romero), a colony-hospital with 80 hectares, located 10 kilometers away from the city of La Plata. He performed a remarkable job until 1916, when he resigned to devote himself exclusively to philosophy. His management at the head of the hospital was truly transformative: He extended the hospital facilities significantly, established the therapeutic system of labor therapy, and founded the first six agricultural colonies. In 1973, after more than 50 years, his work was eventually recognized when the government of the Province of Buenos Aires renamed the hospital with his name, Hospital Alejandro Korn.

Since 1912, he wrote a series of notes that were later collected and published in a book under the title of *Influencias filosóficas en la evolución nacional* (*Philosophical Influences on national development*) (Korn, 1936a). As early as that time, at the University of Buenos Aires, there were signs of interest in new thoughts that represented an alternative to positivism. In this first essay, Korn laid the foundations for a reflection on the homeland in the search for a national philosophy (Sanchez Reulet, 1937), by revisiting Sarmiento (1811–1888), Mitre (1821–1906), and especially Alberdi (1810–1884), as advocates of a positivism that underscored progress. He stated that the so-called “generation of the 1880s” saw

in the positivist philosophy the confirmation of Alberdi’s spirit (Torchia Estrada, 1961).

In 1918, after the University Reform at Universidad Nacional de Córdoba in Argentina (National University of Cordoba) and later extended throughout Latin America, he was appointed Dean of the Faculty of Philosophy and Humanities at Buenos Aires University. Korn played a key role as an ideologist of the reform movement. Two years later he published *La libertad creadora* (*The Creative Freedom*) (Korn, 1920/1936b), which was a profound reflection on freedom with the aim of fostering the maximum participation of men and women, and of the free subject in the voluntary transformation of the world (Romero, 1956). Eugenio Pucciarelli (1960) pointed out that according to Korn “freedom is experienced as liberation, emancipation from servitude, overcoming obstacles, removing constraints” (Pucciarelli, 1960, p. 32).

In 1925, he wrote *Nuevas Bases* (*New Bases*), in which he expressed once again his intention to recover the national philosophical production represented by the youths who had been the protagonists of the May Revolution of 1810. Korn considered that such generation, although they were not philosophers dealing with abstract questions, left behind a philosophy (Korn, 1925/1940). Korn understood this new mission of philosophy linked to culture and institutional life. The creative freedom that revolved around the human condition was a continuity of these approaches. With it, he overcame the deterministic interpretation of a certain Spencerian-style positivism and led the *antipositivism reaction* from the systems of Rickert (1863–1936), Dilthey (1833–1911), and Bergson (1859–1941) by demonstrating that, according to purely biological evolution and the inescapable laws of matter, man was left aside by not explaining culture, free will, and his spiritual nature.

His main contribution to psychology came from his essay *Axiología* (*Axiology*) (Korn, 1930/1938), in which he reviewed and gave final supporting to the findings on the subject of *values* that concerned almost all Argentine philosophers during the twentieth century, specially Coriolano Alberini (1886–1960), Alberto Rougés (1880–1945), and Luis Juan Guerrero

(1899–1957). It was at that time that the ideas of Max Scheler (1874–1928) – who saw man in his relationship with the world through valorization – gained popularity. He differentiated between the objective reality of science and the subjective reality of philosophy, which Korn reduced to axiology. He asserted that the physical reality cannot be discussed – at most, it can be verified or measured – and that in the subjective reality man does not behave indifferently in the world but adopts attitudes, appreciates, admits, or rejects (Korn, 1930/1938). Korn gave the name of *valorization* to the reaction of the human will that is the personality itself.

A considerable number of disciples considered Alejandro Korn as one of the most renowned thinkers in Latin America in his time, and his disciples offered homages to his work. The studies dedicated to him by Francisco Romero (1952), Angel Vasallo and Luis Aznar (1940), Diego Pró (1976), and Torchia Estrada (1936), among others, expressed their noble sentiment toward the master. Luis Farré (1958) defined him as an autodidact “isolated for many years in towns of little importance in the Province of Buenos Aires, where he practiced medicine and in his spare time he enjoyed reading of the great masters of philosophy” (p. 127).

Enrique Eduardo Krapf was the son of Juan Enrique Krapf (1874–1935), a physician, and Ana Adelaida Haase, both belonging to families of the Jewish upper middle class, well assimilated in Germany at the turn of the century (Carofile, 2001). Krapf graduated as a physician in 1923 at the age of 22 at the University of Leipzig. His doctoral dissertation, *Catatonic symptoms in manic-depressive madness*, showed her interest in the Krapelinian psychiatric tradition (Carofile, 2001). In 1924, he joined the Neurological Clinic of the Faculty of Medical Sciences in Hamburg as a practitioner (*medizinalpraktikant*) where he worked with Professor Max Nonne (1861–1959), one of the main developers of the field of neurology (Klappenbach, 2004).

In 1926, he obtained a position as internal physician at the Neuropsychiatric Clinic of the Faculty of Medical Sciences in Munich, headed by Professor Oswald Bumke (1877–1950), where, the following year, he became Clinical Head of the Chair of Psychiatry and Neurology (Krapf, 1948). In 1928, he was appointed Foreign Medical Assistant of the Chair of Neurological Clinic at the Faculty of Medical Sciences in Paris headed by Professor Guillaín (1876–1961), and in 1929, he returned to his former position at the University of Munich. In 1933, he became Privatdozent of Psychiatry and Neurology at the Faculty of Medical Sciences of the University of Köln (Krapf, 1948).

When Hitler (1889–1945) became chancellor of Germany, the law excluding Jews from public administration and universities was passed in April 1933 (Ramos-Oliveira, 1973). Krapf left Germany and after a brief stay in Paris and London, he settled in Buenos Aires, where he adopted Argentine citizenship (Universidad de Buenos Aires. Facultad de Ciencias Médicas, 1934–1963). Krapf had already visited Argentina 1926 as a result of an agreement between the Neurological Clinic directed by Nonne in Hamburg and the German Hospital of Buenos Aires (Carofile, 2001). In Argentina, he met Margarita Elene Hirsch, whom he married on September 20, 1926 (Klappenbach, 2004).

Already moving to Argentina, Krapf had to revalidate his medical degree. On November 22, 1937, he defended his second doctoral dissertation, *The influence of seasonal rhythm on the frequency of mental illnesses*, directed by the well-known psychiatrist Gonzalo Bosch (1885–1967). Immediately he was appointed Physician Assistant in the Hospice of the Mercedes directed by Bosch. In 1938, he was appointed Acting Chief of the Hospice Admission Service and in 1939 Head of the Hospice Service (Krapf, 1948).

At the same time, he received international distinctions, among them, the incorporation as Foreign Medical Attaché of the Chair of Psychiatric Clinic of the Faculty of Medical Sciences of London, directed by Professor Maphoter (1881–1940) and Fellow of the Society of

Medicine of London (University of Buenos Aires. Faculty of Medical Sciences, 1934–1963).

In the 1940s, Krapf began to be an outstanding personality in the field of neuropsychiatry, psychoanalysis, and psychology. In 1941, he was appointed to the Cátedra de Clínica Psiquiátrica (Chair of Psychiatric Clinic) at the (Universidad de Buenos Aires (University of Buenos Aires), in 1947 Free Professor of Psychiatric Clinic, and in 1949 Adjunct Professor of the same course. Likewise, together with Pichon Rivière (1907–1977), he was one of the first to introduce psychoanalysis in practices at the Hospicio de las Mercedes (Mercedes Hospice) towards the end of the 1930s. He completed his training at the Asociación Psicoanalítica Argentina (Argentine Psychoanalytic Association, APA) (Plotkin, 2001). In 1947, he became an adherent member of the APA and in 1950 became a full member of the APA (Klappenbach, 2004).

Krapf considered that psychiatry shared some of its pillars with psychology and neurology (Krapf, 1961), and emphasized the need for preventive psychiatry to have “a predominantly psychological and sociological orientation” (Krapf, 1951, p. 320). For his part, he considered that psychiatric knowledge was based on two sources; on the one hand, modern neurological research; on the other, modern psychology that “has deeply penetrated into the dynamics of the mind” (Krapf, 1961, p. 10).

He belonged to many scientific and professional institutions. Since 1936, he was a member of the Liga Argentina de Higiene Mental (Argentine League of Mental Hygiene) and since 1937 of the Sociedad de Historia de la Medicina (Society of History of Medicine) and the Asociación Médica Argentina (Argentine Medical Association); since 1938 of the Sociedad de Neurología y Psiquiatría (Society of Neurology and Psychiatry); and since 1940 of the Sociedad de Psicología de Buenos Aires (Society of Psychology of Buenos Aires) (Klappenbach, 2004).

Between 1947 and 1950, he was professor in the course of Psicología Médica (Medical Psychology) in the Curso Superior para Psiquiatras (Higher Specialization for Psychiatrists). Krapf considered that, for the physician, medical

psychology was as basic a science as anatomy and physiology. He integrated psychological approaches of different origins and became interested in the “essential unity of the human person” (Krapf, 1959, p. 13), in a direction close to the personalism of Stern (1871–1938), another prominent personality exiled from Germany (Klappenbach, 2004).

In 1951, he participated in the organization of the Interamerican Society of Psychology, of which he was elected first President (Klappenbach, 2004). Krapf became increasingly involved in international activities and projects. In 1948, he participated in London in the Third International Congress on Mental Health which led to the transformation of the former International Committee for Mental Health organized by Clifford Beers into the World Federation for Mental Health (Brody, 2004). He served on the Executive Committee of the Federation first as vice president in 1951 and then as president in 1952. Between 1956 and 1957, he was president of the institution. At the same time, he performed prominently at the newly organized World Health Organization. In 1949, he was appointed World Health Organization Expert Consultant in Mental Hygiene for the Government of the Philippines. In 1952, he was appointed Member of the World Health Organization Panel of Experts on Mental Health. In 1954, Delegate of the World Federation for Mental Health in Geneva. Finally, in 1957, he was appointed Chief Medical Officer of the Mental Health Section of the World Health Organization based in Geneva. For that reason, he would remain in Geneva until his death.

Enrique Krapf enormously contributed to the internationalization of psychology, psychoanalysis, and mental health in Argentina.

Costa Rica, Chile · Adolescent psychology

Krauskopf moved to Valdivia, Chile, when she was 1 year old. There she completed her primary and secondary education at the Liceo de Niñas (Public Girls' Institute). She studied at the Universidad de Chile (University of Chile), earning her Psychology degree in 1960 with honors, and was part of the third generation of professionals in Psychology. She received her master's degree in Clinical Psychology in 1999 at the Universidad de Iberoamérica (Iberoamerican University) in Costa Rica.

In 1961, Krauskopf began working at the Departamento de Psicología de la Clínica Psiquiátrica en la Universidad de Chile (Psychology Department of the Psychiatry Clinic at the University of Chile), being the second psychologist to work there. Afterwards she joined Dr. Juan

Marconi (1924–2005) in an innovative project, the Centro de Investigaciones en Salud Mental de la Facultad de Medicina de la Universidad de Chile (Center for Mental Health Research at Faculty of Medicine in the University of Chile), in building creative, nontraditional models and approaches of intervention and teaching medicine in marginal communities. She wrote two seminal papers in 1972 and 1973 on the study of adolescence, with the latter becoming a referent in the field (Krauskopf 1972, 1973).

In 1974, she moved to Costa Rica, where she continued a prolific academic and professional career. By then, youth and adolescence had already become the motto for her life and vocation. From 1978 to 1981, she worked as a clinical psychologist at the Caja Costarricense del Seguro Social (Costa Rican Social Security Fund) along with her private practice. While already having the distinction of being a founding member of the Colegio de Psicólogos de Chile (Chilean Society of Psychologists), she also cofounded and later served as President of the Colegio de Profesionales en Psicología de Costa Rica (1983–1984) (Professional Society of Psychology, Costa Rica), notably being the first woman to earn that position. From 1974 until 1991, she taught various courses in adolescence, youth, community psychology, and psychodiagnosis at the Escuela de Psicología and the Facultad de Medicina de la Universidad de Costa Rica (School of Psychology and the Faculty of Medicine at the University of Costa Rica). At the same time, Krauskopf has been widely regarded as an expert in the Rorschach Test.

Between 1986 and 1987, Krauskopf earned an Advanced Researcher Fulbright Scholarship, which allowed her to move to New York where she worked with underage populations at risk at the Door Center of Alternatives and did research at the Psychiatry Institute from Columbia University. In 1987, she was an invited researcher at the Deutsches Jugendinstitut (DJI, German Youth Institute) in Munich, Germany.

She was director of the Instituto de Investigaciones Sociales de la Universidad de Costa Rica (Institute for Social Research at the University of Costa Rica) between 1987 and

1991, being the first psychologist to work there, and the first female to head the institution.

In 1991, Krauskopf was designated Professor Emeritus at the University of Costa Rica thanks to her pioneering work and significant contributions to the field of Psychology. Between 2007 and 2014, she worked as a professor at the Universidad de Chile (University of Chile), where she taught courses for the Master's Program in Adolescence while also serving as a member of the Academic Committee in Psychology at the Universidad del Desarrollo (University of Development, Chile). During this time, she also worked at the Adolescent Clinic of the Clínica Alemana (German Clinic, Chile).

Krauskopf is an international teacher, clinician, researcher, and consultant in Adolescent and Youth Development in different sociocultural contexts. Moreover, her range of expertise also encompasses teenage pregnancies, adolescent rights, violence reduction, work with vulnerable groups, youth social policies, and programs.

She has been an invited lecturer in Latin America, the United States, Europe, and Africa. She is a consultant for various Multilateral Organizations: Pan American Health Organization (PAHO), United Nations Population Fund (UNFPA), United Nations Educational, Scientific and Cultural Organization (UNESCO), United Nations International Children's Emergency Fund (UNICEF), United Nations Economic Commission for Latin America and the Caribbean (ECLAC), as well as other distinguished international organizations such as the Inter-American Development Bank (IDB), the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ, German Cooperation Fund), Organization for Cooperation and Economic Development (OECD, the Agencia Española de Cooperación Internacional (AECI) (Spanish Agency for International Cooperation), the European Union, the Kellogg Foundation, the Interamerican Institute for Human Rights, the Organización Iberoamericana de Juventud (Iberoamerican Youth Organization), and many government entities all over Latin America. Among others, she has given lessons and lectures at the Graduate Studies System of the Universidad de Costa Rica

(University of Costa Rica), the Universidad de Perú (University of Peru), the Universidad Católica de Uruguay (Catholic University of Uruguay), Latin American and Caribbean Center at the University of Florida, Universidad de Manizales, Colombia (University of Manizales, Colombia), University for Peace (UPEACE, Costa Rica), University of Santiago, Chile, and the Universidad de Carabobo, Venezuela (University of Carabobo, Venezuela).

Her several publications around the world have renewed and shaped existing theories on adolescent and youth development, especially those focusing on youth social participation, identity issues (such as multicentered identity theory), and paradigms for social policies. Her perspective of the juvenile phase of life, including clinical, teaching, research, and policymaking settings, has been that of intergenerational relationship which actively includes the voice of youngsters in modern times. One of her most relevant contributions to the field is increasing the visibility of young people as social subjects in development in a stigma-free manner, including multiple factors surrounding that growth process such as biology, family, history, culture, context, and social vulnerabilities (D. Krauskopf, personal communication, September 16, 2020).

She has received many distinctions including the National Psychology Award (Chile) in 2011, the Distinguished Professional Trajectory Award in the Congreso Regional de la Sociedad Interamericana de Psicología (Regional Congress of the Interamerican Psychological Society) in 2004, the Distinguished Professional Trajectory Award of Sociedad Peruana de Adolescencia y Juventud (Youth and Adolescence Society of Peru) in 2012, as well as the Distinguished Professional Trajectory Award at the Congreso Latinoamericano de Niñez, Adolescencia y Familia, Cuba (Latin American Congress of Childhood, Adolescence and Family, Cuba) in 2013, the Distinguished Professional Trajectory Award of the Capítulo de Adolescencia de la Sociedad Chilena de Psicología (Adolescence Committee of the Chilean Pediatrics Society) in 2008, and the Tribute to Promotors of Youth Studies in Latin America from the Asociación de Estudios Latinoamericanos (Latin-American

Studies Association), in Barcelona, 2018. Furthermore, she has been an honorary member of the Asociación Costarricense de Psicoterapia (Costa Rican Psychotherapy Association) since 2005 and has also been an honorary member of the Capítulo de Adolescencia de la Sociedad Chilena de Pediatría (Adolescence Committee of the Chilean Pediatrics Society) since 2014.

Neuropsychology

Son of Romanian emigrants, who once resided in the populous Parroquia La Pastora (Pastora Parish), Caracas-Venezuela. He attended the República del Paraguay (Republic of Paraguay) public school and the Colegio Andrés Bello (Andrés Bello School), where he studied up to the 7th grade. Due to the precarious economic situation, at a very young age, he began working as a diamond cutter. He continued his studies – at night – at the Liceo Alcazar (High School Alcazar) and finally graduated as a Bachelor of Science (1949), at the Andrés Bello School.

The early death of his mother on January 9, 1946, was the determining event that made him decide to study medicine. He entered in this program at the Universidad Central de Venezuela (UCV) (Central University of Venezuela), but the university was closed due to political circumstances during the government of Pérez Jiménez

(1952–1958), so he emigrated to Ecuador and managed to be accepted at the Universidad de Quito (University of Quito), where he studied the second year of the program.

With the opening of new quotas for the medical program at the Universidad de Los Andes (ULA) (University of the Andes), located in the state of Mérida, Venezuela, he returned to the country and completed the third year of his program there. The reopening of the UCV allowed him to finish his studies and obtain the degree of surgeon on August 4, 1956.

He began his residency at the Hospital Vargas (Vargas Hospital) in Caracas (1956) in psychiatry, where he provided support and collaboration in the care of a neurosurgical patient, a fact that prompted his interest in diseases of the nervous system, so he redirected his studies to the specialty of Neurosurgery, obtaining the specialization degree on December 15, 1959. Dr. Krivoy was trained in Psychiatry at the Vargas Hospital in Caracas and the Venezuelan Red Cross. He worked with Dr. Herrera Luque (1927–1991), who assigned him the task of evaluating police officers. Later, he performed a neurological and psychiatric evaluation of pilots. He devoted himself to the study of psychoanalysis in a self-taught manner. He carried outpatient care at the Carrizales Psychiatric Hospital (Colina, 2018).

He obtained the degree of Doctor of Medical Sciences at the UCV (1969). He developed his work as a teacher starting at the UCV (1959), where he achieved the title of Full Professor in the Chair of Neurology at the Escuela de Medicina Luis Razetti (Luis Razetti School of Medicine) (1975). He dedicated himself to the professional practice as a Neurosurgeon, becoming one of the most recognized in the country and making very important contributions to this specialty.

In the 1970s, he promoted the development of neuropsychology, brought to the country the most recognized tests in this field and brought together professionals in the area who were dedicated to neuropsychological evaluation. He also introduced advanced technology for the time, such as linear brain echosonography, transcranial

impedancemetry, impedance rheoencephalography – all this before the existence of tomography and magnetic resonance imaging – which, together with the neuropsychological evaluation batteries, allowed to obtain a comprehensive view of the patient. These tools were fundamental for the pre- and postoperative evaluation of patients with neurological diseases, assessment of patients with psychiatric symptoms, and establishing differential diagnoses.

By integrating his training in psychiatry and neurosurgery, he created a psychotherapy modality based on the psychoanalytic perspective and the understanding of the biological bases of behavior. He opened the neurosurgery postgraduate course at the Hospital Universitario de Caracas (University Hospital of Caracas), to carry out one of the first research works in the area of neuropsychology.

His vocation for medicine and teaching allowed him to become a professor of the Neurosurgery Chair and Service of the Hospital Clínico Universitario (University Clinical Hospital) (1979–2001), Head of the Pediatric Neurosurgery Chair and Service of the Hospital de Niños José Manuel de los Ríos (Children's Hospital José Manuel de los Ríos). He was founder and president of the Sociedad Venezolana de Neurocirugía (Venezuelan Society of Neurosurgery), of the Federación Latinoamericana de Sociedades de Neurocirugía (Latin American Federation of Neurosurgery Societies), Sociedad Venezolana de Neurocirugía Pediátrica (of the Venezuelan Society of Pediatric Neurosurgery), and president of the Sociedad de la Historia de la Medicina (Society of the History of Medicine) (2003–2005). He occupied in the Academia Nacional de Medicina (National Academy of Medicine), Chair No. XXXVIII, elected on November 1, 2007 (Colina, 2018).

For his contribution to the development of neuropsychology in Venezuela, he was recognized as an Honorary Member of the Sociedad Venezolana de Neuropsicología (Venezuelan Society of Neuropsychology) (November 17, 2002) at the Colegio de Médicos del Estado Miranda (Medical Board of the state of Miranda).

Argentine · Germany · Wundt · Mental totality · Experience

German philosopher and psychologist, he began his university studies in 1893 in Strasbourg under the guidance of Wilhelm Windelband (1848–195) and Theobald Ziegler (1846–1918). Later, he continued studying in Berlin with Friedrich Paulsen (1846–1908) and Wilhelm Dilthey (1833–1911). In 1895, he moved to Munich where he completed his training with Johannes Cornelius (1863–1947) and Theodor Lipps (1851–1914). He received his doctorate at the University of Munich in 1897 with the dissertation *The Concept of the Absolute Valuable as a Fundamental Concept of Moral Philosophy*. After working as an assistant at the Institute of Physiology in Kiel, he worked as a disciple of Wilhelm Wundt (1832–1920) in Leipzig. In 1903, he became professor in Leipzig. He

was a member of the Geifren Society of Experimental Psychology and an honorary member of the Leipzig Society of Philosophy.

In Argentina, he arrived to take over the chair of philosophy at the Instituto Nacional del Profesorado Secundario (National Institute of High School Teachers) created in 1904. He was the sixth German professor employed by this institution (Falcone, 2012). At the Universidad de Buenos Aires (Buenos Aires University), he organized the development of scientific psychology by inaugurating in 1906 the second course in psychology at the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities). Such a course was taught in parallel to *Psicología experimental y fisiológica* (Experimental and Physiological Psychology) by Horacio Piñero (1869–1919) since 1901. He was hired to teach this course between 1906 and 1907. Through his classes, he introduced the ideas of Dilthey and Kant; he promoted a psychology of totality, and the total structure of experience. He also highlighted the problem of values and proposed a functional structure that did not exclude genetic and evolutionary approaches. He promoted an opening toward Gestalt and phenomenology that had a strong influence on important figures of university life, such as Coriolano Alberini (1886–1960). The person who continued his work within the second course of psychology was Dr. Otto Schultze (1872–1950) (Rossi, 1995).

Between 1912 and 1913, he was a visiting professor at Columbia University. Then he returned to Germany where he served in the Army during 3 years before returning to Leipzig in 1917. There he became Wundt's successor in the direction of the Institute of Experimental Psychology. He also held the chair of psychology and philosophy of W. Wundt and founded with prominent collaborators the well-known "Second School of Psychology of Leipzig," under the principles of a genetic psychology of totality and structure.

In 1918, he published his research *The profound dimension and contrasts of emotional life*, in which he analyzed Wundt's theory on the multi-dimensional character of feelings. In 1928, he

received an honorary doctorate degree from Wittenberg College in Springfield (Ohio).

The arrival of the National Socialist government in Germany had a great impact on psychological currents and psychologists. Many of the gestalt theories became key concepts in the National Socialist ideology once the Nazis took power in 1933. In Krueger's case, his link was controversial. In 1934, he was appointed rector but did not accept this position. However, he quickly gained enormous influence and power in psychological circles (Vine, 2009). He also came into conflict with the national socialist government, which removed him, and retired in 1938. In April 1945, he moved to Basel, where he died 3 years later at the age of 74.

Although he briefly remained in Argentina from 1906 to 1907, he left lasting marks on the university. His work at the University of Buenos Aires and the academic debates that took place during his stay are well documented in 17 pages of his personal correspondence with W. Wundt (Taiana, 2005). These letters were translated into English and Spanish in 2003 and relate the resistance of the academics of the time to consider his ideas close to philosophical sources and far from pure experimentalism.

Thirty years after his stay in Argentina, two collections of Krueger's studies were published: *Estudios psicológicos* (Psychological studies) (Krueger, 1939) due to the interest of the students of the Universidad del Litoral (Litoral University) and *La totalidad psíquica* (The mental totality) (1945) published by the Instituto de Filosofía de la Universidad de Buenos Aires (Institute of Philosophy of the Buenos Aires University). Two renowned Argentine professors, Francisco Romero (1891–1962) and Carlos Astrada (1894–1970), wrote the prologues of these collections: Romero to the first one and Astrada to the second one. His ideas were incorporated into the psychological knowledge on those years, especially in their conception of the mind as a totality, his theory of feelings, his critique of analytical psychological orientation, and his conception of the emotional apprehension of values. Related to the second collection, *La totalidad psíquica* (The mental totality) (1945), it must also mention a

second edition, in 1969 under the title *Estructura y totalidad psíquica* (Structure and mental totality), whose first edition was part of the contemporary philosophy collection of the Instituto de Filosofía y Letras (Institute of Philosophy of the Faculty of Philosophy and Humanities) of the Universidad de Buenos Aires (Buenos Aires University). It and included three essays: *El concepto de estructura en la psicología* (The concept of structure in psychology), *Introducción a la totalidad psíquica* (Introduction to the mental totality), and *El problema de la totalidad* (The problem of totality).

The importance of Krueger's work was highlighted in 1949 at the First National Congress of Philosophy held in Mendoza (Argentina). At that congress, a session was devoted to honoring Félix Krueger through a presentation made by another well-known professor in philosophy, Eugenio Pucciarelli (1907–1995) (Pucciarelli, 1950).

His last work in Switzerland focused on the idea of totality deals with Platon's dialogues, Meister Eckhart's writings, and Kant's *Opus Postumum*.

In this author, the virtues of the laboratory researcher converge with the excellence of the philosopher, contributing to the debate between theories centered on experimental sciences and philosophy. At the same time, he opened the way for the appreciation of Dilthey's psychology which implied a new point of view in research, a stricter methodological criterion and a deepening in the domain knowledge of psychological facts and their meaning.

Chile · Educational psychology · New School · Feminism

Amanda Crispina del Carmen Pinto Sepulveda, known as Amanda Labarca, was the first Extraordinary Professor of Psychology in Chile who carried out her work in much of the twentieth century. In 1902, she finished her middle studies in the Liceo Isabel Le Brun de Pinochet (Isabel Le Brun de Pinochet Lyceum); in 1905 when she was only 18 years old, she received the title of teacher of Spanish in the *Instituto Pedagógico de la Universidad de Chile* (Pedagogical Institute of the University of Chile). In 1922, she obtained the position of Extraordinary Professor of Psychology in the Faculty of Philosophy and Humanities of the University of Chile, becoming the first woman to carry out university teaching in the country and throughout the southern cone of America (Delgado, 1946; Reyes et al., 2002). In March 1923, she taught her first course in psychology and remained teaching until

approximately 1954. Other courses she taught were Educational Sociology, Problems of Middle Education in Chile, History of Education in Chile, and Comparative Education (Salas, 1996).

She made multiple trips abroad, mainly to the United States and France, where she was able to observe and learn the characteristics of the respective educational systems in order to contrast them with the prevailing panorama in Chile. In 1910, she traveled to the United States with her husband Guillermo Labarca, from whom she took her surname and entered the famous Teachers College of Columbia University in New York, where she was a student of important figures related to education and educational psychology such as John Dewey, William Kirkpatrick, and Edward Lee Thorndike, among others. In 1912, she traveled to Paris to study at the Sorbonne, an improvement that was completed only 2 years before the start of World War I (Salas, 1996). In one of her earliest works, *Actividades Femeninas en los Estados Unidos* (Women's Activities in the United States) (1914), she highlighted the virtues of American High Schools and compared their characteristics with local establishments, based on their psychological impact on students (Salas et al., 2019). She was also one of the first to promote the introduction of the New School, detailing the contributions of Ferriere, Robin, Reddie, Lietz, and Decroly, among others. She suggested that this model presented defined ideals of collaboration where intellect, feeling, and will were integrated. She also explained that her research included

internships in the field with a coeducational perspective (Salas & Morgado-Gallardo, 2018).

In 1918, like Domingo Faustino Sarmiento and Valentín Letelier, she traveled, commissioned by the Government of Chile, to study the North American school; she published her experiences of the trip in *La escuela secundaria en Estados Unidos* (Middle School in the United States) (1919). This trip also influenced her books *Nuevas orientaciones de la enseñanza* (New Orientations for Teaching) (1927), *Evolución de la segunda enseñanza* (Evolution of Middle Education) (1938), and *Bases para una Política Educacional* (Bases for an Educational Policy) (1944).

She was an important follower and introducer of the psychological and pedagogical principles of William James in Chile and knew in detail his diverse works which consist of the contents and references in his writings, in which he stated that his pedagogical influence should be attributed more to his qualities as a psychologist than a philosopher (Salas et al., 2014).

She was very critical of the Chilean school when she contrasted it with its counterpart in the United States. She considered that these schools did not lead their students to suffer anemia, sclerosis, or mental fatigue, nor did they overwhelm them with a large number of useless figures and details. She also made it clear that they did not have students tied to school benches from 8 a.m. to 5 p.m.

In 1922, she published *Lecciones de Filosofía* (Lessons in Philosophy), in which she divided psychological facts into three major groups: intellectual or representative, sensitive or affective, and volitional or active. She declared that the first group is related to intelligence, the second to feeling, and the third to will. In relation to intellectual and affective life, she outlined some relevant differences, realizing that the phenomena of intellectual order would be more precise and disparate by separating one idea from another, in the same way that our judgments and reasoning differ. This contrasts with affective life where situations sometimes please us and at other times upset us, thus transforming the pleasant into the unpleasant (Salas et al., 2014).

In 1931, she was appointed Director General of Middle Education, from which position in 1932 she promoted the creation of a “pedagogical laboratory,” giving form to the Liceo Manuel de Salas (Manuel de Salas Lyceum), devoted to the application and experimentation of new organizations, methods, and teaching programs.

In 1947, she published *Feminismo Contemporáneo* (Contemporary Feminism), one of her most important works on the role of women in society, which deals with the trajectory of the feminist movement in Chile and a series of educational and political issues related to the emancipation of women. In this book, she raised the importance of girls learning early on about child psychology in school. In 1919, she founded the National Women’s Council and led organizations such as the Association of University Women and the Chilean Federation of Women’s Institutions, during the 1930s and 1940s, respectively. In 1946, the President of the Republic, Gabriel González Videla, appointed her as Chile’s ambassador to the United Nations (Stuven, 2019), and in 1969 she was appointed a member of the Academy of Political and Moral Sciences of the Institute of Chile (Rivera, 2018).

In the words of the former Rector of the University of Chile, Juvenal Hernández Jaque (2019), Labarca was “one of the most talented women in Chile” (p. 25). In her complex activities, she was concerned with the praxis and application of psychological theories in the national context and particularly with respect to pedagogical practices (Winkler & Reyes, 2010), being a pioneer in the field of educational psychology in the preprofessional stage.

His parents are Juan Lafarga Vallejo and Fannie Corona Corona. He was named José Juan Bautista Nicolás, surnames Lafarga Corona, better known as Juan Lafarga Corona. He was the second of four children, named Guadalupe, Juan, Nicolás, and Luz María.

Due to religious persecution in Mexico, and the prohibition of teaching religion in schools in Mexico, he was homeschooled during his first years, taught by his aunt Luz Maria, a career teacher. At the age of 8, he entered the Colegio de las Madres del Verbo Encarnado (School of the Mothers of the Incarnate Word); from there he went to the Colegio de los Padres Benedictinos de San Rafael (School of the Benedictine Fathers of San Rafael) to attend the sixth year of primary school, when he was only 9 years old.

He was enrolled in high school at the Escuela Apostólica de San José en la Compañía de Jesús

(Apostolic School of San José, in the Society of Jesus), where he reaffirmed the values learned at home and school. The passion for sports and teamwork awakened in him and would accompany him throughout his life.

At age 15 he entered the Noviciado de San Cayetano de la Compañía de Jesús (The Novitiate of San Cayetano, of the Society of Jesus), in the State of Mexico. At age 18 he wrote a novel called *Horizons of Glory*, awarded with the publication in the Buena Prensa publishing house, in 1961. He ventured into the field of classical letters and humanities at Instituto Libre de Filosofía y Letras (Free Institute of Philosophy and Letters) obtaining his first degree (1947–1950).

From 1951 to 1954, he earned his second degree in philosophy. From 1954 to 1956, he became a secondary and preparatory teacher at the Instituto Oriente de Puebla (The East Institute of Puebla), where he began his editorial work with the publication of the Revista “Forja” (Forja Journal), seed of many others that he would later be founder of. Later from 1956 to 1960, he earned his third degree in theology, thus culminating a cycle of religious formation in his life.

He moved to the University of Loyola in Chicago to carry out the master’s and doctorate studies in clinical psychology, between 1961 and 1966. There, he had a first contact with the person-centered approach of Carl R. Rogers (1902–1987), through one of his professors, and later, director of his doctoral thesis, Charles A. Curran (1913–1978), author of the book *Counseling in Catholic Life and Education*, close collaborator of Rogers.

At the same time, Juan Lafarga, as a fellow in clinical psychology, had an internship at the Neuropsychiatric Institute of the University of Illinois, where he met and befriended Rosalind Dymond Cartwright (1922–2016), who, shortly before, had published with Rogers the book *Psychotherapy and Personality Change* (1954).

Upon his return to Mexico, in 1966, he immediately joined the Universidad Iberoamericana (UIA) (Ibero-American University), to work in the field of academia, research, and administrative positions. The first course he taught was called philosophy of psychology, where he began to sow

the first ideas of the humanistic orientation in psychology in Mexico.

Very soon, a group of students asked him to create a training program in psychotherapy for psychologists, which was called counseling, understood as orientation or psychotherapy, title with which it was approved by the Technical Council, in 1967. Thus, Lafarga Corona became a pioneer of the first psychotherapy training program for psychologists in Mexico. It should be noted that he did not know Carl R. Rogers personally until 1974. From that date, they had a strong and deep friendship that lasted until Carl’s death in 1987.

With the foundation of this training program, and overcoming resistance and attacks from other health professionals, Juan Lafarga contributed to changing the traditional roles assigned to the Mexican psychologist. This program later became a masters in psychotherapy.

Also, at this time, in 1968, he translated Bosselman’s book *Neurosis and Psychosis* (1967) and carried out research in the UIA about the religious attitudes of students and attitudes to the use of drugs.

That same year, Lafarga Corona made another bold move for the Center for Psychological Orientation of the UIA, of which he was its director: founding the counseling program for non-psychologists, giving birth to the human development movement in Mexico as a professional discipline. The barrage of criticism and personal attacks came immediately and made him pass exceedingly difficult moments in his life. At the same time, the results of the program gave him a very deep and lasting satisfaction throughout his personal and professional life. In 1973, the first master’s program in orientation and human development for non-psychologists was established in the UIA, with Lafarga as director.

For Juan Lafarga, human development, in his own words, “implies a process of change of the person in the direction of growth; Therefore, it is the ultimate goal of professionals in all disciplines. That is why it invites biologists, philosophers, engineers, doctors and psychologists to be trained, among others” (Lafarga quoted by García Muriel and others 2005, p. 85). Juan’s dream was crystallized in 1975 when the Graduate Academic

Committee approved the creation of the Department of Human Development at the UIA. A year later, in 1976, the Doctorate in Human Orientation and Development was approved.

Lafarga Corona coined the term humanistic psychology in 1977, and conceptualized it as the study of the intrapsychic and interpersonal basic dynamics that drive the evolution of the person, as well as the study of social and environmental conditions that favor the functioning of the individual and the groups in society. He thus became a pioneer and promoter of the humanistic current in psychology in Latin America.

At this time, in co-authorship with José Gómez del Campo (1941 to date) and with the express and written authorization of Carl R. Rogers himself, they began to translate various articles of his authorship, and other authors, which served as the basis for the human development programs that were being offered both in the UIA and in Instituto Tecnológico y de Estudios Superiores de Occidente (ITESO) (the Institute of Technology and Higher Studies of the West) of Guadalajara (1975). Later they were published in four volumes as *Development of Human Potential*, Vols. 1–4 (Lafarga & Gómez del Campo, 1978a, 1978b, 1986, 1992). Soon after, master's programs in human development would also be offered at the Leon, Puebla, Tijuana, and Torreón campuses of Universidad Iberoamericana (Ibero-American University) itself; Carl R. Rogers himself acknowledged the merit of Lafarga Corona for having been able to introduce the humanistic orientation and the person-centered approach in the university field, something that Rogers himself could not carry out at the University of Chicago, or any other University Institution of the United States where he worked.

Presently, the movement of the study of human development has extended to 25 of the 32 states of the country, where they are offered equally programs of specialty, masters and doctorate in institutes, and public and private universities.

Internationally, since the late 1970s, human development has extended to Granada (Spain); Bogotá, Cali, and Barranquilla (Colombia); Quito (Ecuador); El Salvador; and Quetzaltenango (Guatemala), and also in Costa Rica, Haiti,

Paraguay, and Mali and many other countries in Africa, Latin America, and the Caribbean.

In 2001, the Asociación de Desarrollo Humano de México (ADEHUM) (Human Development Association of Mexico) was formed. Facilitators from 22 states of the country attended the First Founding Assembly. In 2006, the Instituto Nacional de Investigación en Desarrollo Humano (National Institute for Human Development Research) in Mexico was founded.

At the UIA, Lafarga held the positions of director of the Experimental Master's Degree in Education; Member of the First University Senate from 1971 to 1976, of which he was moderator for 2 years; Member of the promoter team of the Academic Reform of the UIA; General Director of Postgraduate Studies and Research in 1973 and founder of the Academic Committee of the same; Director of the Department of Human Development in 1977; Director of the Department of Psychology in 1981; Member of the Governing Board of Loyola University in Chicago of 1987–1995; Member of the Governing Board of the University of San Francisco (USF), from 1994 to 2003; Founder of the Transformation and Change program (1992–1996); Academic Director General (1996); President of the UIA Educational System-ITESO from 1996 to 1998; and Vice President of the Association of Jesuit Universities of Latin America (AUSJAL), also in 1996.

As part of the UIA Departments of Psychology and Human Development, he founded the *Prometheus Magazine: Mexican Journal of Humanistic Psychology and Human Development* (1992) and received the following awards: Reconocimiento al Mérito Universitario (Recognition of University Merit for 15 years of service) (1981), Reconocimiento como Director del Departamento de Desarrollo Humano (1977–1982), Recognition to his work as Director of the Department of Human Development (1977–1982), Medalla al Mérito Universitario (Medal for University Merit for 20 years of service) (1986), Medalla del Senado Universitario (Medal of the University Senate in recognition of his work therein) (1989), Premio Jaime Castiello the Jaime Castiello Award for the promotion of humanism in the training of psychologists and in university

education, 1990; and Premio Internacional de Empatía (1991 (International Empathy Award (1991) by the International Empathy Association for being the most representative person of the Person Centered Approach)). A year later the UIA recognized him as Profesor Emérito (1992) Professor Emeritus for 25 years of academic work (1992), and in 1997, he received the Medalla de Oro José Sánchez Villaseñor (José Sánchez Villaseñor Gold Medal) for 30 years of service to the UIA.

He was founding member of Consejo Nacional para la Enseñanza e Investigación en Psicología (CNEIP) (the National Council for Teaching and Research in Psychology) founded in 1971, governing body of the training of psychologists in Mexico. For over 48 years, the Council has set the guidelines in teaching, research, and professional practice of the discipline and has encouraged its institutional members to establish their educational programs in psychology, based on the criteria and quality indicators embodied in the CNEIP accreditation model, promoted by Lafarga Corona himself (Odrizola Urbina, 2001).

Juan Lafarga remained active in the Council for over 40 years, during which he held the positions of teaching coordinator, linking and dissemination coordinator, research coordinator, founder and editor for the first 9 years of the *Magazine: Teaching and Research in Psychology* (1975), and executive secretary (1993–1997). He prepared the first Manual of Organization of the Council and also promoted the preparation and publication of the Manual for the Preparation of Thesis, in Trillas publishing house (Ibáñez Brambila, 1990, 1995), a fundamental instrument of the CNEIP, to promote research in psychology in Mexico.

At the same time, he created the following awards at the CNEIP: the national thesis contest to recognize the best of the research carried out every year at the bachelor's level in the various public and private institutions of the country, the National CNEIP award for the most outstanding researcher of the year in psychology, and the CNEIP Merit award, for contributions to the Council itself. These last two were conferred on him years later (1993 and 2005).

He also participated actively in the Sociedad Mexicana de Psicología (Mexican Society of Psychology), where he founded the *La Revista Mexicana de Psicología* (*Mexican Journal of Psychology*) (1985) and worked hard on the Psychologist's Code of Ethics (2007), and its continuous updating. In 1986 he was awarded the Premio al desempeño profesional (Professional Performance Award), and in 1987, he received the Premio Nacional de Psicología (National Psychology Award) from the Mexican Society of Psychology. Also, in 1983 he received the Premio al Psicólogo Distinguido (Distinguished Psychologist Prize) awarded by Universidad de las Américas Puebla (University of the Americas – Puebla).

He published 84 articles in scientific and dissemination journals and, indeed, few books, given his initial training in literature and classical letters and his extraordinary ability to write. He said about it: "I prefer to accompany people than writing books, because I feel that the people I have accompanied multiply more than the writings" (Lafarga quoted by García Muriel et al. 2005: 82). For his own merits, he was appointed national investigator from 1993 to 1996.

His last book was entitled *Human Development: Personal Growth* (Lafarga 2013), corollary of his work in and for Mexico.

Juan Lafarga Corona died in Mexico City at 6: 55 a.m. on November 20, 2016, at the age of 86, the anniversary of the Mexican Revolution, not without first asking his assistant for a big hug goodbye to this life.

Lafuente, Carlos Luis

Born in *Carapeguá (Paraguay)* on April 29, 1944

Died in *Asunción (Paraguay)* on April 13, 2000

José E. García

Universidad Católica, Asunción, Paraguay

Keywords

Paraguay · Cognitive psychology · Behavioral psychology · Health psychology · Catholic University

The small town of Carapeguá, birthplace of Carlos Luis Lafuente, nicknamed “Lucho” Lafuente by his friends and students, is located 84 kilometers south of Asunción, on the Route 1 that connects the country’s capital with the southern city of Encarnación, on the border with Argentina. His high school studies were carried out between 1958 and 1963 at the Liceo “Andrés Bello” (“Andrés Bello” Lyceum) in Asunción. Later, he began the university stage of his training, choosing a career in psychology at the Universidad Católica “Nuestra Señora de la Asunción” (Catholic University “Our Lady of the Ascension”) to obtain his Licenciatura (Bachelor’s degree) there. The professional training of psychologists in Paraguay began at that same university in 1963 (García, 2021), and Professor Lafuente was part of one of the first graduating classes of psychologists at that institution and the country. The research that he carried out to apply for the professional diploma of psychologist was entitled “Psicopatología del adulto mayor” (Psychopathology of the elderly), written in coauthorship with Venecia Verdún and defended in 1969.

Among Lafuente’s first professional assignments were a position as psychologist in the Departamento de Salud Mental (Department of Mental Health) of the Ministerio de Salud Pública y Bienestar Social (Ministry of Public Health and Social Welfare), which he held between 1968 and 1970; a position as a school counseling

psychologist at the Escuela Normal de Profesores No. 2 (Normal School of Teachers Number 2) of Asunción, between 1970 and 1971; and a job as a clinical psychologist at the Instituto Médico Psicológico (Psychological and Medical Institute) (IMESI), one of the main private assistance and training institutions at the beginning of Paraguayan professional psychology (García, 2011). The connection that Lafuente carried out in the IMESI took place between 1971 and 1972. Other similar functions were added to these ones, which he would undertake in later years. The academic and university phase of his career began with a position as contracted professor for the course of Developmental Psychology at the Escuela de Enfermería (School of Nursing) of the Universidad Nacional de Asunción (National University of Asunción) in 1972 and later in the chair of Social Psychology in the Departamento de Sociología y Ciencias Políticas (Sociology and Political Sciences Department) at the Catholic University between 1975 and 1977.

In the second half of the 1970s, he had the opportunity to continue his studies abroad, for which he undertook a trip to Colombia. In that country, he became a student of the Master's Program in Educational Research and Technology taught by the Pontificia Universidad Javeriana (Pontifical Javeriana University) in Bogotá, remaining linked to it between 1979 and 1980. He was also assigned to work as an assistant professor in the Research Methodology chair of the Faculty of Communication, a position he held between 1980 and 1981. During his stay in Colombia, he met and made friendship with several leading psychologists at that time, who were first his teachers and later remained as friends. This strengthened personal and professional relationships that were never extinguished despite the distance and the time elapsed.

Back in Paraguay, he resumed his academic relationship with the Catholic University that would last for the rest of his life. As far as teaching is concerned, Lafuente was a very active member of the Psychology Department, as head of the chair in various courses, successively. Some of them were Developmental Psychology, Social Psychology, Psychological Research, and

Contemporary Psychological Systems. At certain times, he was also assigned to teach History of Psychology, substituting teachers with temporary permission. At the Instituto Pedagógico (Pedagogical Institute) of the Catholic University, he was in charge of Educational Research and Learning Theories. Toward the end of his life, his teaching was closely identified with the courses of Educational Psychology and Psychology of Learning, which were taught both in Psychology and Educational Sciences departments.

Parallel to his teaching's occupations, he performed various academic functions within the institutional structure of the Catholic University. He was Director of the Psychology Department, Academic Director of the Facultad de Filosofía y Ciencias Humanas (Faculty of Philosophy and Human Sciences), to which the Psychology Department belongs, carried out some technical activities at the Oficina de Planificación (Planning Office) of the Catholic University, and was a member of the team of specialists of the Vicerrectorado Académico (Academic Vicerectory). Likewise, he officiated as a representative of the Consejo de Universidades (Council of Universities) at the MERCOSUR Educativo (Educational MERCOSUR). In the 1990s, he was among the promoters of the Psychology degree that Universidad Católica established in Ciudad del Este, an urban center located on the eastern border with Brazil, whose courses began in 1994. As a member of the Vicerrectorado Académico, Lafuente's support for directors and professors of this department was determinant, especially with regard to the implementation of its curriculum.

In the academic sphere, his collaboration with the editorial committees of some important psychology journals on the continent stood out, including the *Revista Latinoamericana de Psicología* (Latin American Journal of Psychology), founded in 1969 by Rubén Ardila (born 1942) and published for many years in Colombia, as well as the *Revista Intercontinental de Psicología y Educación* (Intercontinental Journal of Psychology and Education), created by the Peruvian psychologist Luis Oblitas (1950–2019). In 1999, when the Paraguayan psychology journal *Psicosur* (Psychosouth), directed by psychologist

José Britos, was briefly established, Lafuente was one of the academics called to be a part of its editorial board.

The conceptual approach of Lafuente's work leaned him toward psychology represented by behaviorism, which formed the main basis of his learning during the formative years abroad. He later evolved toward positions that brought him closer to cognitive approaches. He was attentive to the mediators of learning, thus surpassing the functional analyzes of behavior, typical of radical behaviorism. His concerns were essentially directed toward psychology applied to education, where research on learning and the physiological bases of psychological processes aroused his interest (García, 2000). His teaching fluidly alternated between the concepts of authors such as B. F. Skinner (1904–1990) and Albert Bandura (1925–2021) and neuropsychologists such as Alexander Luria (1902–1977). Likewise, he was drawn to social psychology. It was common to hear him affirm that education is always a social and political phenomenon. Despite the limitations in budget and equipment that negatively condition psychological research in Paraguay, Lafuente supported and promoted, as far as possible, the experimental psychology at the Catholic University, supporting the work of professors who taught that chair (García, 2010), in an academic environment where the influence of psychoanalysis was clearly predominant. He is also mentioned as the first to spread concepts and research in the area of health psychology in Paraguay in the mid-1980s (García, 2015).

Lafuente's publications were preferably located in the area of education, mainly university teaching, which was his main axis of professional activity. Together with the sociologist Miguel Ángel Aquino, he wrote a book entitled *Características y tendencias del sistema educativo en el Paraguay (1970–1987). Preliminares de una aproximación crítica* [Characteristics and tendencies of the educational system in Paraguay (1970–1987). Preliminaries of a critical approach], published in 1990, as well as other works in collaboration that were related to university education, such as *La educación superior en Paraguay* (Higher education in Paraguay), written with psychologist Carlos

Ramírez and pedagogue Diomedes Rivelli and a research concerning *La universidad paraguaya y sus egresados. Un estudio de seguimiento* (Paraguayan university and its graduates. A follow-up study), carried out together with psychologist Oscar Serafini (1931–2021) and the aforementioned Rivelli. In an unpublished document, he also contributed to the design of the curriculum of the Catholic University in Ciudad del Este, together with psychologist Marta Lafuente, a niece of his, and Diomedes Rivelli.

In the personal aspect, Carlos Luis Lafuente was a person with very open ideas and perspectives, far removed from dogmatism (García, 2000). His affable, courteous, and considerate treatment and, above all, his peculiar sense of humor make his friends and former students to remember him not only for his contributions to research and teaching of psychology, but also for having been someone of exceptional individual conditions.

Sílvia Tatiana Maurer Lane was born in São Paulo, in the State of São Paulo, Brazil, into a family of Swiss-German origin (on her father's side) and Slav (on her mother's). Contact with her father, a university professor, and uncle, a specialist in philology, seems to have awoken in her a taste for the intellectual. Her mother, marked by her experience in the First World War, in Lithuania, transmitted to her a horror of violence and war, and the commitment to humanization and to the improvement in people's quality of life. She graduated in philosophy at the University of São

Paulo, SP, in 1956, where she had as professors intellectuals like João Cruz Costa (1904–1978), Antonio Cândido de Mello e Souza (1918–2017), Gilda Mello e Souza (1919–2005), Dante Moreira Leite (1927–1954), Carolina Martuscelli Bori (1924–2004) and Annita de Castilho e Marcondes Cabral (1911–1991). Annita introduced Sílvia to Psychology, through the reading of the work of the German psychologist Kurt Koffka (1886–1941). In the Faculty, between 1952 and 1956, Sílvia Lane became involved in the activities of the students' Academic Centre, and developed an interest in questions linked to the psychology of language, especially in the differences in the meanings of words for different social groups (Sawaia, 2002). This theme she chose to develop in her doctoral thesis, defended in 1972, under the orientation of Aniela Meyer Ginsberg (1902–1986). In 1955, she obtained a scholarship to study psychology for a year at Wellesley College, in the United States, where she became acquainted with the work of the social psychologist Solomon Asch (1907–1996). After obtaining a bachelor's degree and licentiate in Philosophy in 1956, she became a research assistant at the educational division of the Centro de Pesquisa Educacional de São Paulo ((São Paulo Regional Centre of Educational Research) between 1956 and 1960, and occupied the position of Director of the Division in 1959–1960. She started her teaching career in 1957 as professor of General Psychology at the São Paulo Red Cross Nursing School and in 1965, at the invitation of Maria do Carmo Guedes (1934–. . .), she became professor of Social Psychology and Personality Psychology at the Pontifícia Universidade Católica de São Paulo - Puc-SP (Pontifical Catholic University of São Paulo). After the defence of her Doctoral thesis, in 1972, she initiated, together with her colleagues, the Postgraduate Programme in Social Psychology at the same university, the second Postgraduate Programme in Social Psychology to be established in Brazil, and commenced the trajectory of researcher in the area, orientating dozens of Master's dissertations and Doctoral theses. From then on she participated actively in the activities of the Associação Latino-americana de Psicologia Social (Latin American Social Psychology Association) (ALAPSO), being a

member of its Board between 1977 and 1980, and of the Sociedade Interamericana de Psicologia (Interamerican Society of Psychology) (SIP).

It was at the Congress of the Interamerican Society of Psychology, in 1979, in the midst of discussions about the so-called “crisis” in Psychology, especially Latin-American psychology, not considered very relevant in the solution of social and political problems in the region, that the recommendation was approved suggesting the creation of national associations of Social Psychology. These were to focus on the real situation of each country and provide an incentive for the exchange of researchers and students in the field. Very receptive to the idea, Sílvia proposed the creation of the Associação Brasileira de Psicologia Social (Brazilian Association of Social Psychology) (ABRAPSO), during the 32nd Annual Meeting of the Brazilian Society for the Progress of Science in July 1980, and was its first President. ABRAPSO became, from that time on, the main forum of discussion and publicity for the Social Psychology done in Brazil, focused on the knowledge of the psychosocial conditions of the Brazilian population, and on the debate about transforming practices of which Sílvia was one of the main promoters.

At the start of the 1980s she undertook visits to several Latin American universities with her colleague Maria do Carmo Guedes, to become acquainted with projects of psychosocial intervention inspired by ideas to raise consciousness of the problem of oppressed social groups and their emancipation. Arising out of the studies that had marked the building, by Sílvia Lane, of a Social Psychology focused on Latin American reality, an article written by Guedes in 2007 describes their journey to six countries in the region - Colombia, Cuba, Ecuador, Mexico, Peru, Venezuela. The trip proved to be a valuable opportunity to get to know at first hand projects focused on populations submitted to diverse types of oppression and exploitation, some of which are described in detail. The text is organised so as to show the reader some antecedent conditions (previous experience of Lane in the area of community psychology and joint working experience of the travellers), the project (the possible choices relative to a journey of studies), the journey (procedures and results of

the interactions established, with information that would allow the recuperation of the projects visited) and, finally, some implications of this opportunity of learning with colleagues and projects, in a real situation so close to the Brazilian one (Guedes, 2007). These visits resulted in Lane and Guedes leading a network of psychologists engaged in building a Social Psychology approach contributing to social transformation in Latin America.

Also at that time Sílvia Lane commenced the publications that were to make her internationally recognized because of her original proposal for an agenda for Latin American and Brazilian Social Psychology, at the same time critical, well-founded theoretically and focused on the practice of social transformation. The first of these publications was a book on Social Psychology as a field of knowledge, published by Editora Brasiliense, in São Paulo. This short work aroused so much interest that soon afterwards Sílvia organized, together with the student and colleague Wanderley Codo, a collection on Social Psychology, also published by Brasiliense. In the Introduction, Sílvia criticises Psychology as a positivist science, which deals with the abstract individual who merely responds to environmental stimuli like an automaton. Instead, she proposes the consideration that Social Psychology must consider the social and historical aspects that mould subjectivity, and, at the same time, the possibility of raising consciousness and the creativity that make possible social transformation. This discourse points criticism in the direction of the ideology of adaptation, which pervaded Psychology produced under the harsh conditions of the military dictatorship in Brazil, and also the sensitivity for the search of a transformation of the precarious conditions of life of the lower classes in the country. Sílvia's desire was to build a Social Psychology that focused on the search for solutions to the social questions of her time, through first-hand knowledge of the conditions of life and the psychosocial reality of the Brazilian population, especially the low income classes. Her proposal is based on a materialistic and historical reading of the dialectic of the concrete as a synthesis of multiple determinations, and on the lessons of Jean Piaget (1896–1980) and of Soviet

socio-historical psychology, especially that of Lev Semionovitch Vygotsky (1896–1934) and Alexei Nikolaevich Leontiev (1903–1979). The book and the collection soon became best-sellers, being re-published several times and utilised in graduate and postgraduate courses in the universities, demonstrating receptivity in the bosom of the community of Brazilian social psychologists. These publications were followed by others, where Sílvia deepened the perspective of analysis proposed, always insisting on the need to broaden the outlook of the psychologist, incorporating socio-anthropological knowledge, and an active and participative methodology. In 1996 she wrote a chapter on the history and theoretical foundations of community social psychology in Brazil in a collection focused on the field (Campos, 1996). In this work, she explained how this field of knowledge was organized by psychologists who developed a critical thinking regarding their role as professionals in a society traversed by social inequalities and political authoritarianism. The idea was to work on the relationship between mental health and the difficult life conditions observed in lowincome communities in Brazil and Latin America as a whole. She also described how the psychologist should work on the three fundamental categories she proposed for the analysis of group relationships – activity, consciousness and identity, integrating objective and subjective aspects of life. In 1997, Lane presented a lecture at the International Colloquium on Paradigms of Social Psychology for Latin America, during the annual meeting of ABRAPSO, the Brazilian Association of Social Psychology, taking place in the Federal University of Minas Gerais campus. In this lecture, she described the development of the original approach to Social Psychology and to Community Social Psychology then being established by a group of Latin American specialists in which she actively participated, named by Maritza Montero as the “critical construction and transformation paradigm” (Montero, 2000), characterized by the dialogical relationship between the researcher and the research participant, and by the emphasis on the application of scientific knowledge to social transformation. The lecture was published in 2000 in a collection organized by Regina Helena Campos

and Pedrinho Guareschi (Campos & Guareschi, 2000), that also became a best seller, with several re-editions since then. In this text, Sílvia developed a theme that was worrying her at the time: the issue of the ethics of knowledge. In an interview given to the journal *Psicologia e Sociedade*, in 1995, she reaffirms her conviction about the need to democratize knowledge, in our profoundly unequal and excluding society. In her opinion, the acceptance of differences, the struggle against prejudice and discrimination depended on this democratization, that is, on the presence of the intellectual outside the walls of academia, acting and interacting with social groups.

Between 1990 and 2006, Sílvia Lane presented her researches in the Working Groups of the Associação Nacional de Pesquisa e Pós-graduação em Psicologia – ANPEPP (Brazilian National Association of Research and Postgraduate Studies in Psychology). In 1990, 1994, 1998, 2000 and 2002, she participated as a researcher in the Working Group on Community Psychology. In 1992, she coordinated a Working Group focused on “Philosophy of Post-Graduate Programs in Psychology in Brazil”, drawing on her experience at the Post-Graduate Program in Social Psychology held at the Pontifical Catholic University of São Paulo. In 2004 and 2006, she participated in the Working Group named “The socio-historical psychology and the Brazilian context of social inequality” (ANPEPP, 2021)

Coherently with her proposal to democratize knowledge, Sílvia knew how to speak to and with younger people. One can see this in her texts, both her papers describing empirical research as well as the theoretical ones, in the examples she uses, continually, without losing the degree of reflection demanded by a scientific discourse. They are always examples of concrete cases, which she brings from the research work of her students, to which she always gives due credit. One can see it also in the talks to graduate students in Psychology, whose invitations she never refused. The last public lecture, in the second semester of 2005, was done at the invitation of students of the Universidade Regional de Blumenau (Blumenau Regional University), in the state of Santa Catarina, Brazil, on the occasion of naming the Academic Psychology Centre after her. Another

mark of her coherence may be found in her editorial work, organizing collections in which she presented her students. She was the organiser of six issues of the periodical edited by the Social Psychology Post-Graduate Programme of the Puc-SP (Pontifícia Universidade Católica de São Paulo). *Cadernos PUC*, numbers 1, 4, 11, 15, 23 and 34). She also entered into partnerships with some of her Master's and Doctorate students in the books she organized.

The Social Psychology approach proposed by Lane, the critical socio-historical psychology, is characterised by considering socio-cultural dialectic as constitutive of the human being, at the same time emphasizing the transforming and creative force of consciousness. Inspired by Marxism, and hand in hand with Liberation Psychology of Martín-Baró, this perspective of analysis of psychosocial processes is based on the inseparability of theory, methodology and the transforming practice. For Sílvia, all Psychology is social, as the human being is constituted in the social, being the product and the producer of history, through the mastery of working tools and the development of speech and consciousness. Thus, Social Psychology subjects of study should be language use and group interaction, because it is through these two processes that human beings acquire their identity. The methodology to be utilised should be participative and qualitative, focused on listening to social groups, knowing their problems and promoting their emancipation. This idea that knowledge leads necessarily to transforming action, to practice, in search for a fuller and more satisfactory life in ethical terms, permeates Sílvia's whole work in the Social Psychology area, and is the mark that distinguishes her perspective.

In 2007, a group of partners, colleagues and students of Sílvia Lane's work, led by the invited publishers, Bader Burihan Sawaia, Maria Helena Coelho and Ana Maria Jacó-Vilela, organized a special volume of the ABRAPSO periodical *Psicologia e Sociedade*, in honour of the writer. In this issue, in which Sílvia is remembered as the "psychologist of political action" (Sawaia et al., 2007, p. 6), the authors record memories of the psychologist, single out her proposal of contributing to the construction of a psychology focused

on the concrete problems of the Brazilian and Latin-American reality, and her theoretical and practical contribution to the development of an original approach within the context of contemporary Social Psychology

 Psychoanalysis · Feminism

Marie Lizbeth Glas Hauser, a feminist physician and psychoanalyst of Austrian nationality, with outstanding accomplishments in Argentina and Mexico, was born in Vienna to a well-off Jewish family. The younger of two daughters, from an early age, she expressed her desire to receive formal education and asked her parents to enter a school which would allow her to pursue further studies. They agreed to her request and Marie entered Schwarzwald Schule, a model school ahead of its times which merged feminist thinking and social-democratic ideas. Later on, she began her medical studies at the University of Vienna, and in 1932 she joined the Austrian Communist Party motivated by the growing threat of Nazism. Shortly before finishing her studies, she became interested in psychiatry and started her own

analysis with psychoanalyst Richard Sterba (1898–1989).

In 1935, at the age of 25, she received her medical degree and began her psychoanalytic training at the Vienna Psychoanalytic Training Institute, which was then presided by Sigmund Freud. The following year, together with her husband, surgeon Max Langer, she joined the International Brigades which had been summoned to defend the Spanish Republic. Both of them worked as doctors in Colmenar and then in Murcia, where Max directed the Orthopaedics Unit. When the war was about to finish, given the upcoming victory of Franco's nationalist forces and the growing antisemitism throughout Europe, the couple decided to emigrate to Uruguay.

After some years of economic hardship, in the early 1940s, Marie and Max settled in Buenos Aires, Argentina, and Marie came into contact with a group of local psychoanalysts. In 1942, together with Ángel Garma (1904–1993), Celes Cárcamo (1903–1990), Arnaldo Rascovsky (1907–1995), Guillermo Ferrari Hardoy (1907–2002), and Enrique Pichon-Rivière (1907–1977), she founded the Asociación Psicoanalítica Argentina, APA (Argentine Psychoanalytic Association). She was the only woman in this group and was responsible for obtaining the recognition of Argentine psychoanalysis by the International Psychoanalytical Association (IPA). In the following decades, she contributed steadily to the strengthening of the Psychoanalytic Association (which she presided for a period) and the Institute of Psychoanalysis. She worked as a training analyst at APA for 29 years. Marie Langer also established relations with neighboring countries such as Uruguay where she participated in the creation of the Asociación Psicoanalítica Uruguayana-APU (Uruguayan Psychoanalytic Association) and in Brazil, participating in 1945 of the Congress of Psychosomatics and of the I Inter-American Congress of Medicine where she linked with local psychoanalysts and established ties with Buenos Aires. She was especially interested in women's sexuality and maternity, which she approached from their characteristics and disturbances by linking psychoanalytic conceptions with anthropological and sociological theories about

women's social status. This perspective was reflected in her book *Maternidad y sexo* (Maternity and Sex), published in 1951 (Langer, 1951). Groupality was another subject of her interest. In 1954, she co-founded the Asociación Argentina de Psicología y Psicoterapia de Grupo (Argentine Association of Group Psychology and Psychotherapy) with a group of psychoanalysts interested in group processes and group phenomena. Among them were León Grinberg (1921–2007) and Emilio Rodrigué (1923–2008) with whom she wrote *Psicoterapia del Grupo* (Group Psychotherapy) (Grinberg et al., 1961). During those years, Mimí, as she was affectionately called, encouraged the practice of group psychotherapy in several institutions (Puget, 2001).

Regarding her family life, her four children were born while living in Uruguay and Argentina. Her husband Max died in 1965. Her husband's death and the political climate of those times were determining factors for her to become involved in politics again. Thus, at the Congress of the International Psychoanalytical Association held in 1969 in Rome, she joined the International Platform, an organization that questioned the ideology and rigid perspective of the International Psychoanalytical Association and its constituent organizations. She also participated in the Federación Argentina de Psiquiatras-FAP (Argentine Federation of Psychiatrists), which at the time stood out for its progressive stance and social critique. These activities and her growing nonconformity with the rigidity of psychoanalytic institutions led to her resignation from the Psychoanalytic Association in 1971 after delivering her presentation "Psychoanalysis and/or Social Revolution" at the international congress held in her hometown Vienna. The co-authored book *Cuestionamos* (We Question), which she prefaced and co-wrote, reflects her associations between Marxism and psychoanalysis. That same year she was invited by the Argentine Communist Party to travel to the USSR to learn about the characteristics of its mental health system (Sinay, 2008).

In 1973, Marie Langer was appointed Associate Professor of Medical Psychology at the Facultad de Medicina de la Universidad de Buenos Aires (Medicine Faculty of the University of Buenos Aires), and she also worked as a

psychiatrist at Hospital Avellaneda (Avellaneda Hospital). The following year, at the end of 1974, the Argentine Anticommunist Alliance, known as "Triple-A," emerged in a government sector. This organization would persecute students, activists, intellectuals, and any "suspected" leftist. Marie Langer was reported to be on the "blacklists" and quickly emigrated to Mexico, embarking on a new exile. Langer would live in that country from 1974 to 1987, where she participated in various psychoanalytic institutions, such as the Asociación Mexicana de Psicoterapia de Grupo-AMPAG (Mexican Association of Group Psychotherapy) and the Círculo Psicoanalítico Mexicano-CPM (Mexican Psychoanalytic Circle), in addition to working as a professor at the National Autonomous University of Mexico. Her pioneering interest in women's issues led her to review her book *Maternidad y Sexo*, introducing new feminist views, such as the questioning of motherhood ideals and the articulation between conscious and unconscious aspects of gender impositions on women. In 1975, she served as a panelist for the United Nations in the International Women's Year in New York, and in 1977 she participated in the First Mexican-Central American Symposium on Research on Women. Her sustained social commitment prompted her to coordinate the International Mental Health Team from Mexico to support Sandinistas in Nicaragua in 1981. That same year she wrote her autobiography, and in 1982 she travelled to Cuba for the first time, where she would have an important role in the organization of the Meeting of Psychoanalysis and Marxism in 1986 (Langer et al., 1989).

When democracy was restored in Argentina in 1983 after the civil-military dictatorship, she returned to Buenos Aires, where she spent her last years working tirelessly and instilling her passion for the articulation between feminism, Marxism, psychoanalysis, politics, and groups until her death in December 1987, at the age of 77.

Back when Luis Lara Tapia was a high schooler, he got interested in the study of dreams, which led him to read Freud's dream interpretation work. He

decided to do his bachelor's degree at the Facultad de Filosofía y Letras de la Universidad Nacional Autónoma de México (Faculty of Philosophy and Humanities at National Autonomous University of Mexico) (UNAM), on History, which he studied at the Casa de los Mascarones (The House of Masks), colonial building located on the avenue Ribera de San Cosme, in the Santa María la Ribera neighborhood, Mexico City, since between 1953 and 1954, the Faculty of Philosophy and Humanities stayed in that building before being transferred to University City (González, 2012). Afterward, he got in the Facultad de Medicina (Faculty of Medicine) (UNAM). His interest for both sociocultural psychology and social anthropology once again led him to the Faculty of Philosophy and Humanities to study psychology; his medical training provided him with a scientific orientation, so when faced with the psychological practice of those times, he was impressed with the subjectivity mental health professionals had when making their diagnosis; it was then that his interest in psychology focused on psychometrics, since he considered it to be a more objective form of diagnosis.

As a psychology student he faced a merely academic psychology in which psychoanalysis was predominant. During 1957 he embarked in a movement via the Congreso de Estudiantes de Psicología Latinoamericano (Congress of Latin American Psychology Students in Mexico), where 13 countries from Latin America took part; in this event the need for a professional and independent psychology was stated for the first time, because up until that moment, they were under control by psychiatrists and psychoanalysts, in words from Luis Lara Tapia, psychology back in the moment was a "subprofession" (Carrascoza, 2003a, 2003b).

In 1960, after concluding his abroad studies, Luis Lara Tapia comes back to Mexico and integrates as a professor in the then known as Escuela Nacional de Psicología (National School of Psychology) (ENP) from the UNAM; he was one of four professors who had psychology formation; the rest of the teachers were doctors, philosophers, and educators, which repercutated on student's formation. During that same year, he was a promoter

of the Project Pedregal, which consisted in students having classes aside from the official curriculum, as an alternative to the completely psychoanalytical content in the plan of studies. Besides, in the period between 1960 and 1965, he made various trips to the University of Texas and brought students to the Institute of Human Development in Kansas; this allowed them to be in contact with experimental psychology (Carrascoza, 2003b).

In 1964, alongside Rogelio Díaz-Guerrero (1918–2004), he conducted an investigation with 23 students from several generations. This research included the study of personality development in two cultures, so it was also done in the USA, allowing a comparison with Mexico (Carrascoza, 2003a).

Being a teacher and with Héctor Manuel Cappello García (1935), he was given the task of changing the curriculum of the career; it was in 1970 that he began that work, so, in 1971 the new Plan of Studies of the College of Psychology came into force, and it continued to be in force for more than 30 years; this new curriculum allowed him to be head of the Department of Experimental General Psychology and Design; this department would control 24 of the 30 mandatory subjects and 27 optional subjects (Escobar, 2016; Herrera, 2000; Millan, 1982).

At the same time and with the aim of increasing the number of psychologist teachers, Luis Lara Tapia promoted that students from the ENP started giving classes to peers from lower years. Luis Lara Tapia also got into the task of promoting student scholarships, both national and international, promoting a book translation program, which allowed expanding the existing bibliographic collection (Herrera, 2000).

Thanks to his medical training, abroad studies, and constant search to establish a scientific psychology, Luis Lara Tapia along with his contemporaries Héctor Cappello and Serafin Joel Mercado Doménech (1939–2017) played an important role in the development of the behavioral analysis in Mexico by supporting the study of behavior (Millan, 1982). Proof of this is the fact that during 1972, he made arrangements to

acquire research equipment for operant conditioning from the company TechServ (Ribes, 2016).

On February 27 of 1973 when the rector of the UNAM was Pablo González Casanova (1970–1972), Luis Lara Tapia was named founding director of the Facultad de Psicología (Faculty of Psychology) (FP), a position he would hold for 4 years (1973–1977). Once he assumed the direction of the FP and thanks to the acquisition of the TechServ equipment, for the first time in Mexico, research and experimental publications on animal behavior were carried out. From 1974 to 1975, he supported the creation of the first teaching laboratories (20 or 30 boxes of operant conditioning and bioterio of rats). As director, Luis Lara Tapia achieved that at the end of 1973, the Dirección General de Profesiones de la Secretaría de Educación Pública (General Directorate of Professions of the Ministry of Public Education) issued professional certificates of psychologists to those who obtained the professional title (Herrera, 2000; Ribes, 2016).

During the period when he directed the FP, he founded the Coordination of Open University of the FP and structured the first Technical Council (Amador, 2012). Luis Lara Tapia was founder of the Escuelas Nacionales de Estudios Profesionales (National Schools of Professional Studies) (ENEP) Iztacala and Zaragoza, as well as the psychology career at the Xochimilco and Iztapalapa schools of the Universidad Autónoma Metropolitana (Metropolitan Autonomous University) (UAM) (Herrera, 2000). Similarly, in 1973, he named Emilio Ribes Iñesta (1944) responsible for reorganizing the postgraduate program in Experimental Analysis of Behavior (AEC) (Ribes, 2015).

It is worth mentioning his teaching work at the Escuela de Trabajo Social (School of Social Work), as well as a teacher at campuses 1, 3, 4, 8, and 9 of the National Preparatory School of the UNAM. He was the founding and honorary president of the Consejo Nacional para la Enseñanza e Investigación en Psicología (National Council for Teaching and Research in Psychology) (CNEIP) and first honorary member of the Mexican Society of Experimental Analysis (Herrera, 2000).

After a long illness that took him away from academic and professional life, Luis Lara Tapia died in November 2000. However, his fundamental contribution to consolidate scientific and professional psychology in Mexico persists, and this allowed psychology in Mexico to become a professional discipline.

Larraín Acuña, Hernán

Born *in Santiago, Chile, October 13, 1921*

Died *in Santiago, Chile, September 6, 1974*

Carlos Cornejo
Pontificia Universidad Católica de Chile,
Santiago, Chile

Keywords

Chile · Phenomenological psychology · Depth psychology · University reform · Democratic socialism

A Jesuit priest, Hernán Larraín was *Universidad Católica de Chile's* (henceforth: UC) *Escuela de Psicología* (School of Psychology at the Catholic University of Chile) director from 1957 to 1967, where he also worked as a faculty member until his passing on September 6, 1974. He was born in Santiago de Chile on October 13, 1921, and studied philosophy at *Colegio Máximo de San Miguel* (Argentina). He then undertook theology studies at Louvain University (Belgium) and at Innsbruck University (Austria), where he obtained his BA in theology in 1953.

Between 1954 and 1956, he studied psychology at Munich University. In July 1957, he became head of UC's *Departamento de Psicología* (Psychology Department), succeeding "Eduardo Rosales". His time directing the department was consequential both at institutional and disciplinary levels. From an institutional perspective and following Rosales' administration, Hernán Larraín: (a) achieved the autonomous status of the department, becoming UC's *Escuela de Psicología* (School of Psychology) (since April 7, 1959), still remaining within UC's *Facultad de Filosofía, Letras y Ciencias de la Educación* (School of Philosophy, Humanities and Educational Sciences), and yet gaining independence from the *Escuela de Pedagogía* (School of Pedagogy), fulfilling Rosales' original initiative;

(b) updated the curricula according to international standards and broadened the range of professional internships; and (c) ratified the academic conditions to obtain a professional psychologist's degree.

From a disciplinary perspective, Hernán Larraín instilled the School of Psychology with a theoretical imprint driven by German phenomenological psychology and psychoanalysis (Camus & Muñoz, 2017; Salas & Lizama, 2009). Characterized by his intellectual sharpness and a deeply humanist training, Hernán Larraín set the German notion of "depth psychology" (*Tiefenpsychologie*) at the center of the school's curriculum, a notion that includes, yet precedes and exceeds, psychoanalysis (Cohl & Cornejo, 2018). In a letter to "Luis Bravo Valdivieso" (b. 1931), he wrote: "We cannot forget that the main contribution to modern psychology came precisely from the psychology of the unconscious (Freud, Adler, Jung, Binswanger, Szondi, etc.). [...] Pretending to do psychology without an in-depth study of the psychological unconscious mechanisms is to sever psychology's broader field of action [...] (which does not mean we should linger in Freud's work) [...]. The breadth that depth psychology has gained over recent years forces us to consider it a 'matter in its own right'" (Larraín, 1956).

Larraín upheld that phenomenological observation should guide psychological methodology: "To observe is to intuit, to penetrate the sense of things, to grasp their intelligibility by discovering the spirit's trail on matter and facts" (*op cit.*). He lent special attention to the *Theory of Expression* (*Ausdruckstheorie*) represented by Philipp Lersch's work and others' (Bühler, 1933/1950; Lersch, 1958, 1959), since he saw it as a "[...] true corollary to Christian psychology's main thesis: the substantial unity of body and soul" (*op cit.*). While in Chile, his interest in depth psychology brought him closer to the ideas of Ortega y Gasset (1883–1955) – also rooted in interwar German neovitalism – leading to the publication of *La génesis del pensamiento de Ortega* (The genesis of Ortega's thought) (Larraín, 1962),

which received the Atenea Award granted by *Universidad de Concepción*. Despite Hernán Larraín's persistent dedication to promote a wider "depth psychology," his attempts were overshadowed by the strength of the psychoanalytic movement, already established in Chile since the beginning of the twentieth century and quite prominent in psychiatry at the time.

Although his theoretical perspective was not psychoanalytical, it did sympathize with this tradition, which gave place to its marked presence in psychologists' training, especially in the "psychosomatology" course and in clinical internships conducted by students following the teachings of *Universidad de Chile's* renowned psychiatrist "Ignacio Matte-Blanco" (1908–1995) (Matte-Blanco, 1955) – such as Ramón Ganzarain (1923–2008) and Otto Kernberg (b. 1928) (Bravo, 2004, 2013). Consequently, the vitalist-phenomenological broader arching tradition that Larraín advocated for was shrouded by psychoanalysis.

Beyond UC's School of Psychology, Hernán Larraín was an acknowledged intellectual nationwide. From 1959 until his passing, he acted as Director of *Revista Mensaje* (Message Review), a journal dedicated to promoting Catholic social engagement, whose founder was Jesuit priest Alberto Hurtado (1901–1952) – canonized in 2005 by Pope Benedict XVI. The journal served as an outlet for Larraín to write numerous and evocative opinion columns on the mission of the university and Chilean politics: "...the university, and particularly Catholic universities must change their power structure [...] Any kind of monarchy, either state-based, church-based, or of any other kind contradicts the very mission of the university" (Larraín, 1967, p. 90). He also acted as a faculty representative at UC's Superior Council, lending his intellectual power to that university's reform during 1967. Between 1961 and 1963, Hernán Larraín was rector of *Universidad Católica de Valparaíso* (Catholic University of Valparaíso). He partook in the foundation and was a member of the *Academia Chilena de Ciencias Sociales, Políticas y Morales* (Chilean Academy of Social, Political and Moral Sciences), where he acted as first secretary between 1964 and

1970. Permeated by the spirit of a renewed Catholic church, Hernán Larraín was engaged – along with many other fellow priests of his generation – in Chile's and Latin America's social issues, which led to his involvement in a series of initiatives devoted to its analysis. He founded and directed Bellarmino Center, the Centro de Investigación y Acción Social – Chile (CIAS – Chile) (Center for Social Research and Action), and the Instituto de Doctrina y Estudios Sociales (ILADES) (Institute for Social Studies and Doctrine). *Revista Mensaje* was a means to openly manifest his opposition to the capitalist model, and to advocate for a "democratic socialism" that would overcome the freedom restraints of a "totalitarian socialism" (Molina & Larraín, 1971, p. 77).

Eight days previous to Chile's *coup d'état* (September 11, 1973), Larraín wrote: "While I write these lines we are undergoing a state of political crisis that can easily lead to a *coup d'état*, with its subsequent bloodshed [...] I think it is the government and the opposition's fault; mutual intolerance and lack of understanding [...] Everything becomes polarized and radicalized [...] One is either with the opposition or with the government, it is black or white [...] All nuances are ignored" (Larraín, 2003, p. 11).

Lechter Eidelman, Rubén

Born *Panama City (Panama)*, 13 September 1934

Died *Cali (Colombia)*, 31 August 2017

Sonia Meluk

Universidad del Valle, Cali, Colombia

Keywords

Colombia · Clinical · Marketing

Rubén Lechter was born in Panama and raised in Cali (Colombia) by his parents of Jewish origin who migrated from Russia avoiding persecution after World War I. He had three siblings. Ruben attended elementary and high school in Cali. He did his Bachelor and Graduate studies in the USA. He earned his Bachelor's degree in Psychology from the University of California in Berkeley in 1957. He got his Master of Arts degree in Southern Illinois University in 1963 with the thesis "Expectancy, intermittent reinforcement, their interrelation and their effects upon the Pulfrich stereophenomenon." He earned his Ph.D. in Clinical Psychology from Southern Illinois University in 1966. His thesis "The development of expectancy in a two-person situation and its generalization to tasks involving decision-making and social convergence" showed his interest in doing rigorous research to understand decision-making and its effects in a social context. He was a Fellow at Northwestern University Medical School, Division of Psychology in Chicago and visiting professor at Arizona State University and the University of Maryland.

Rubén married Pola Reydburd when he was doing his Doctoral studies, and they had three children.

He returned to Cali (Colombia) and accepted a position as Associate Professor at the Department of Psychology, Division of Education at Universidad del Valle [University of Valle] in 1967. He soon became Head of the Psychology

Department, and later, in 1970 he was appointed as Dean of the Division of Education.

Lechter was the first professor with a Doctoral degree at the Department of Psychology at the University of Valle. He created the “Action group” whose purpose was to offer psychological services to the community not only in Cali but in other cities of the region as well.

He joined the team of professors that designed and created the academic program that offered a degree in Psychology in 1976. This program replaced the Counseling program that was oriented to provide services at schools and vocational centers. Lechter proposed the inclusion of the field of Community Psychology in the new psychology academic program. After that, other universities in Colombia began to include Community Psychology in their academic curricula.

Lechter was a member of the Editorial committee of the Journal *Cuadernos de Psicología* [*Psychology Notebooks*] published for the first time in 1976 by the Psychology Department. Professors and researchers from different universities in Colombia and abroad contributed with their articles. This journal was published for 18 years.

Besides his academic activities, Rubén also cooperated doing consultation at the Psychiatric Hospital in Cali, and he had a private practice as a clinician. He retired from the University of Valle in 1987.

In addition to his academic work, he also developed an expertise in marketing research. Rubén Lechter founded a company called Research Services International (RSI) more than 30 years ago. The company, now called *Lechter Americas*, does marketing research, data collection, and consultation in Colombia and other Latin American countries. Within the context of this work, Lechter was the pioneer of Qualitative Marketing Research in Colombia.

Rubén Lechter Eidelman died in Cali in 2017. He is survived by his three children Adrian, Alida, and Ilan and six grandchildren, Oryan, Julian, Nathan, Dania, Natalia, and Hannah.

Keywords

Brazil · Psychology · National character · Interdisciplinarity · Ideology

Dante Moreira Leite carried out the primary study and the gymnasium (current elementary school) in the city of Mogi das Cruzes, in the state of São Paulo. He transferred to Colégio Estadual Presidente Roosevelt (Presidente Roosevelt State School) in the capital São Paulo, where he completed the classical course, in 1946. He graduated in 1950 in philosophy at Faculdade de Filosofia, Ciências e Letras da Universidade de São Paulo (College of Philosophy, Sciences and Letters of

the University of São Paulo) (FFCL-USP) (Bomfim, 2001; Paiva, 2000; Schmidt & Neves, 2002a, 2002b; Witter, 2001; Zampranha, 2017).

From 1951 to 1958, Dante was a professor occupying the chair of psychology at FFCL-USP. In 1954, he presented to the FFCL-USP the dissertation about Brazilian National Character, under the guidance of Annita de Castilho e Marcondes Cabral. During the years 1955 and 1956, he did postdoctoral researches at the University of Kansas, in the USA. He also served as a psychology professor at the Faculdade de Filosofia Sedes Sapientiae (College of Philosophy Sedes Sapientiae) of the Pontifícia Universidade Católica de São Paulo (Pontifical Catholic University of São Paulo) (PUC-SP) (Bomfim, 2001; Paiva, 2000; Schmidt & Neves, 2002a, 2002b; Witter, 2001; Zampranha, 2017).

In 1958 and 1959, he directed the Division of Educational Studies and Research at Centro Regional de Pesquisas Educacionais (Regional Center for Educational Research) in São Paulo. From 1959 to 1971, he taught the courses of Psychology and Educational Psychology at Departamento de Pedagogia da Faculdade Filosofia, Ciências e Letras (Department of Pedagogy of the College of Philosophy, Sciences and Letters) in Araraquara. In 1964, he obtained the title of professor in educational psychology, with the study psychology and literature, at FFCL-USP. In 1967, he was visiting scholar of Brazilian Literature at the University of Michigan, Chicago, USA (Bomfim, 2001; Paiva, 2000; Schmidt & Neves, 2002a; Witter, 2001; Zampranha, 2017).

In 1971, he returned to USP as a free lecturer at the Instituto de Psicologia (Institute of Psychology) (IP-USP), where he helped organize the Departamento de Psicologia Social e do Trabalho (Department of Social and Work Psychology), and was the department chair until 1974. In 1973, he obtained the title of full professor in social and labor psychology. He was director of IP-USP from 1974 to 1976, when he died prematurely (Bomfim, 2001; Paiva, 2000; Schmidt & Neves, 2002a, 2002b; Witter, 2001; Zampranha, 2017).

Dante dedicated his professional life to teach and research, performing activities as a teacher, researcher, writer, translator, and administrator. His work connects psychology and other areas

of knowledge, escaping from the disciplinary model (Paiva, 2000; Schmidt & Neves, 2000, 2002a, 2002b; Witter, 2001).

His wide range investigations involved education, history, anthropology, translation and language, literature, national character, racial prejudice, fiction, biography and autobiography, and social psychology, markedly original and significant (Paiva, 2000; Schmidt, 2000; Schmidt & Neves, 2000, 2002a, 2002b; Witter, 2001).

Prejudices, stereotypes, identity, and ideology were the central themes of his social psychology. Psychology and literature also deserved special attention in his investigations. His full professor dissertation brought together social psychology and literature analyses, and in addition to essentially academic outcomes, he was also a writer of tales and poems (Bosi, 2000; Paiva, 2000; Schmidt, 2000; Schmidt & Neves, 2000, 2002a, 2002b).

A general interpretation of Dante's main works indicates three axes: conceptions about psychological science; the practice of interdisciplinarity between psychology, sociology, anthropology, philosophy, and literature; and finally, the question of differences (Schmidt & Neves, 2000, 2002a).

He was one of the founders of the Associação Brasileira de Psicólogos (Brazilian Association of Psychologists), in 1954, then titled Associação Brasileira de Psicologia (ABP) (Brazilian Psychological Association), which played an important role in regulating the profession in the country (Castro & Ghiringhello, 2011). He published 7 books and 58 articles in newspapers and journals and translated 47 books. He translated several foreign works of psychology, including handbooks and classics, some translated together with Miriam Lifchitz Moreira Leite (1926–2013), historian at USP, to whom he was married and had two children. Translations were important for expanding the bibliographic material and its circulation, helping Brazilian psychology to establish itself as a science (Bosi, 2000; Paiva, 2000; Schmidt, 2000; Schmidt & Neves, 2000, 2002a, 2002b; Witter, 2001).

The relevance of Dante's work can be seen in the density of his texts, through the testimonies of friends and coworkers (Schmidt & Neves, 2000),

by the Dante Moreira Leite Award granted by the Conselho Federal de Psicologia (Federal Council of Psychology) (CFP), and for the homage of the Municipality of São Paulo that gave his name to a public road and to a Municipal School of Early Childhood Education (Paiva, 2000). In 2006, the Biblioteca do IPUSP (IPUSP Library) is officially called Biblioteca Dante Moreira Leite (Dante Moreira Leite Library).

He died prematurely, leaving a legacy worthy of “a deeper and more profound careful study, detached from fads” (Witter, 2001, p. 7).

León-Eyzaguirre, Federico Rodolfo

Born *Lima, (Peru), 24 July 1940*

Tomás Caycho-Rodríguez
Universidad Privada del Norte Perú, Lima, Peru

Keywords

Peru · Organizational psychology · Social psychology

Federico León-Eyzaguirre completed his studies in psychology in 1964 at the Pontificia Universidad Católica del Perú (Pontifical Catholic University of Peru, PUCP, Lima), where he also taught, as well as at the Universidad del Pacífico (Pacific University), Universidad Nacional Mayor de San Marcos (National University of San Marcos, UNMSM), and at Escuela Superior de Administración de Empresas (Higher School of Business Administration, today *Universidad ESAN*). Since 2013, he works at the Universidad San Ignacio de Loyola

(Saint Ignatius Loyola University, Lima). He obtained a M.A. in Industrial Psychology (University of Detroit, 1974) and a Ph.D. in Organizational Psychology (University of Maryland, 1979), being a visiting researcher at the University of Toronto (1977–1978). Between 1984 and 2009, he worked with North American institutions (Development Associates, Population Council, Georgetown University), always based in Lima, but conducting research in Ecuador, Paraguay, Colombia, Guatemala, Rwanda, and India.

In 1986, he edited a book where he compiled a set of empirical research works carried out by Peruvian authors in clinical, evolutionary, social, and organizational psychology (León, 1986). A review of the literature on organizational, consumer, community, and social psychologies in Peru has also had a wide national impact (León, 2013).

León has investigated the reasons that lead women in the north of Peru to want to have children to a greater extent than those in the south (León, 2011). He has also studied the greater domestic power of women according to the distance to the equator and has formulated the hypothesis that this reflects the influence of ultraviolet radiation (UVR) making men more masculine and women more feminine. He has also pointed out that with high UVR, families are larger and had lesser opportunities for intellectual development for children. This hypothesis was confirmed in Peru (León & Burga León, 2014) and through 102 countries (León & Burga-León, 2015).

Likewise, León has dedicated 25 years of research to the topic of family planning and reproductive health, demonstrating that the effectiveness of counseling in Peruvian hospitals and health centers presented a logarithmic rather than a linear relationship with the time invested in the counselors. They displayed a bureaucratic attitude without taking into account the individual information needs of the user (León et al., 2001). This work originated in an evaluation carried out on a national scale with the purpose of detecting deviations with respect to the norms of the Peruvian Ministry of Health on quality of service as a result of certain scandals about pressure on women to be sterilized (León, 1999). León et al. (2005) created a family

planning counseling methodology that met the individual needs of the user. This Balanced Counseling Strategy has been adopted by the Guatemalan Ministry of Health and disseminated worldwide. He has also created a methodology for evaluating the quality of care using simulated clients who acted in the consultation a profile of habits and preferences that allowed to evaluate with checklists if the service provider responded to the specific needs of the user (León et al., 2007).

In his doctoral thesis, León experimentally demonstrated that decision-making is a process in which individuals treat positive information as a highly discriminatory variable while negative information is treated crudely (León, 1981).

Deviating from these big themes, León (2014) published a conceptual analysis of critical thinking that has received considerable attention.

Valentín Letelier Madariaga was born in 1852 in Linares, Chile, into a middle-class family. Son of Mr. Gregorio Letelier and Mrs. Transito Madariaga, he was the third of 11 brothers and sisters. He studied at the *Liceo de Talca* (Talca High School), where he obtained distinguished grades in all his tests, which became important when, facing family financial crisis, his mother made the greatest efforts so that the young Letelier could continue his studies in the capital of the country, at the *Instituto Nacional* (National Institute) between 1867 and 1871. During this period, the rector of the institute was the prominent pedagogue and historian Diego Barros Arana (1830–1907), whose pedagogical practices he observed and later promoted within the educational reform of that time, and it was there where he would forge his character and his passion for philosophy and the humanities (Moraga, 2014).

Between 1872 and 1875, Letelier studied law at the *Universidad de Chile* (University of Chile).

In 1873, he began to teach history at the American College (Galdames, 1937). During these years, Letelier was linked to the philosophy of Auguste Comte and to literature, being a disciple of José Victorino Lastarria (1817–1888), an outstanding intellectual of the nineteenth century. From the beginning of 1882 until the end of 1885, he studied the most avant-garde pedagogical experiences of the time in Germany, a trip that greatly influenced the intellectual. That influence was reflected years later in his book *Filosofía de la Educación* [Philosophy of Education], written between 1891 and 1892 (Baeza, 2015).

In *Philosophy of Education*, Letelier explored the importance of psychology and its contributions to education, which he exposed in a period when the Chilean educational system was monitoring the changes introduced years before with the Law of Compulsory Primary Education (Seguel, 1957). Letelier pointed out "... in the study of pedagogical problems, scientific solutions will never be reached as long as we continue to disregard the help that it [psychology] offers" (Letelier, 1927, p. X). In this work of approximately 800 pages, Letelier rescued psychology with the purpose of (a) indicating the multiple benefits it can offer in different educational spheres, (b) introducing a series of psychological constructs that were unknown or little studied in Chile, and (c) citing current works and contributions of foreign psychologists that were important and scarcely studied in the national context.

Letelier resorted to psychology because he considered it a useful and complementary science for pedagogy. In his work, he pointed out that psychology contributed to the study of the distribution of workload to positively influence mental hygiene and to the adaptation of academic content to students with some degree of physical or mental disability. He also referred to its relevance in reducing mental fatigue and improving attention processes, as well as to the importance of psychology in learning strategies. He also observed that, in traditional pedagogical practices, a considerable group of students (those with some physical, intellectual, or moral disability) were excluded from the formative processes because of the

inadequacy of these models for those who do not meet mainstream requirements (Letelier, 1927).

Letelier also made extensive use of psychological terminology in the field of education, where the following constructs stand out: perception, intelligence, character, memory, attention, adaptation, distraction, habits, abnormal, psychological anomalies, rebellious and neuropathic students, rewards and punishments, and so on. In addition, it reinforced in the national context the contributions of theorists who developed different areas of psychology (Letelier, 1927) including Hugo Münsterberg (1863–1916) and his book *Psychology and the Teacher*; William James (1842–1910), *The Principles of Psychology*; Alfred Binet (1857–1911), *Introduction to Experimental Psychology*; and Édouard Claparède (1873–1940), *Experimental Pedagogy and the Psychology of the Child*.

His contribution within the embryonic period of psychology can be summarized as an intellectual contribution because he presented extensive work rich in concepts that at that time and even today are of interest to the science of psychology in general and educational psychology in particular. He also positioned himself as a figure of union and reception between European and North American psychology, on the one hand, and the incipient Chilean psychology, which was taking steps to create some laboratories and contributions in specific areas, on the other. Indeed because of the coherence that Letelier imbued in his work, he influenced the hiring of professionals who had knowledge of pedagogical and psychological concepts, such as Georg Heinrich Schneider (1846–1904) and Wilhelm Mann (1860–1920) (Salas, 2015). In addition, during his period, as rector of the *University of Chile* – from 1906 to 1913 – he promoted the creation of the first Laboratory of Experimental Psychology at the *Instituto Pedagógico* (Pedagogical Institute), in charge specifically of Dr. Mann (Salas & Lizama, 2013).

However, his greatest contribution may be related to his visionary work *Philosophy of Education*, where he migrated from the historical or descriptive methods that characterized this area to incorporate psychology in the school space. As Letelier indicated, psychology would come to the

aid of a school system that was beginning to demand the help of other sciences as a result of the diversity of practices that converged in this space.

Finally, it is important to point out that Letelier, in addition to being a visionary in Chilean psychology, performed various roles (teacher, lawyer, philosopher, politician, and writer) in which he knew how to balance thought and action, making his discourse and practice a coherent exercise, positioning him as one of the most outstanding intellectuals of his time (Barría, 2017). He devoted his whole life to establish in Chile a scientific culture of intellectual work, promoting important social and institutional reforms (Salas, 2012).

Communicational styles

David Liberman was born in Buenos Aires, in 1920 in a middle class, Jewish family. In 1945 he married Fedora Jarast, with whom he had two children, Diana and Alex.

After medical school, he began his training in psychiatry. His dissertation was on Psychosomatic Semiology, which in 1947 became his first published book (Liberman, 1947). That work constituted the beginning of his psychoanalytic research. It was prefaced by Enrique Pichón Riviere (1907–1977), who was also his mentor and psychoanalyst.

Along his career, he became president of the Asociación Psicoanalítica Argentina (APA) (Argentine Psychoanalytic Association) between 1964 and 1966, founding member of the Asociación Psicoanalítica de Buenos Aires (APdeBA) (Buenos Aires Psychoanalytic Association), and also its president from 1979 to 1980.

He was a renowned Professor of Psychopathology at the Universidad de Buenos Aires (University of Buenos Aires), in the Psychology Program (Rossi & Becchero, 2020). He also lectured in Rosario between 1976 and 1978 (Santoro, 2012). His colleagues remember him as an admirable supervisor and a caring teacher who had an admirable ability to stimulate new ideas in his students (Santoro, 2012; Winograd, 2015).

Liberman devoted himself to the study of the communicative styles that unfold in the psychoanalytic session. He articulated communication theories with basic notions of psychoanalysis and succeeded in establishing predominant communication styles, indicatives of the psychopathological organization of the person (Germano, 2012). He used detailed records of his patients’ sessions at different moments of the analytic process as data for his research. That allowed him to present careful descriptions of the main features of each style, which correspond to points of libidinal fixation. He tried to determine the appropriate styles for the analyst according to the type of patient, since the achievement of complementarity in communicative styles could improve the analytic work (Liberman, 1962). His theory of styles was complemented by his vision of the psychopathology of overadaptation and the corresponding psychosomatic incidents. He outlined an ideal ego model, the *ideally plastic ego* (Arbiser, 2014; Neborak, 2015).

He was influenced by authors such as Jürgen Ruesch (1909–1995), Roman Jakobson (1896–1982), and Noam Chomsky (1928–). In his approach, he articulated Kleinian psychoanalytic standpoint with Ruesch’s description of communication styles. His work matched empirical with linguistic evidence; he combined the study of factors, functions, and the syntactic of discourse with the pragmatics of human communication, in an open model (Issaharoff & Winograd, 2013). He worked with David Maldavsky (1941–2019) who,

in his tribute, named the method of investigation of the unconscious psychic dynamics: David Lieberman Algorithm (ADL) (Germano, 2012).

The search for systematicity and precision in the psychoanalytic work led him to become interested in the scientificity of psychoanalysis (Issaharoff & Winograd, 2013; Santoro, 2012). He studied with the outstanding Argentine epistemologist Gregorio Klimovsky (1922–2009), from whom he acquired notions related to the hypothetical deductive method. With these notions, he was able to outline the psychoanalytic session as a unit of inquiry, as the empirical basis from which intermediate hypotheses arise. For Lieberman, the psychoanalytic session as an object of investigation, once it has taken place, opens up to a *second circuit* of analysis, with the elements provided by both, the patient and the effects produced by the interpretations.

Four periods in the production of Lieberman's work has been noticed (Issaharoff & Winograd, 2013). From 1950 to 1960, his interest was oriented to the psychopathological and clinical structures. He also studied the couple conflicts in the context of individual psychoanalysis (Lieberman, 1956; Macchioli, 2003), a perspective later enriched by the theory of communication. In 1958, he participated in the famous *experiencia Rosario*, a social laboratory experience organized by Pichón Riviere in which Lieberman worked as coordinator together with Fernando Ulloa (1924–2008) and José Bleger (1922–1972), among others psychoanalysts (Dagfal, 2009). In the 1960s, he opened his scope to the communication model. The classes in the psychology program at UBA with Rafael Paz (1934–) and Carlos Sluzki (1935–) were important in this period. In the 1970s, the attempt was to reduce the gap between clinical problems and the models of the linguistic and semiotic field. From 1980 to 1983, his interest moved to diverse problems, psychosomatic issues, and psychoanalysis of children. The analysis of the child's play material in session allowed him to elaborate a nosography of six play styles, each with its pathogenic and with its normal functioning (Goldberg, 2006).

David Lieberman was a talented piano player, who held a close affinity for music throughout his

life. Raised in a family of musicians, he participated with his brother in the jazz orchestra of his father. His colleagues recall the memorable melodies he played on the piano at the intervals, at the psychoanalytic congresses he attended. His musical experience found its way to integrate into his theoretical elaborations as also in his mode of supervision (Neborak, 2015; Issaharoff & Winograd, 2013). It has been pointed out his attempt to detect the *musicality* of the voices, understood as the different melodies, harmonies, counterpoints, dissonances, accelerations that appeared in the psychoanalytic dialogue (Santoro, 2012; Vainer, 2014).

He was member of the second generation of Argentine psychoanalysts that emerged in the 1950s, a time when psychoanalysis was beginning to acquire an important presence in the social arena. That expansion of psychoanalysis occurred at the same time as the creation of undergraduate psychology programs in Argentina. His involvement as a professor at the UBA contributed to the psychoanalytic stamp of Argentine psychology in the second half of the twentieth century (Dagfal, 2009).

David Lieberman died in 1983, in Buenos Aires, at the age of 63. Characterized as an innovative, original, and laborious psychoanalyst, he made a proposal centered on communication in the analytical session. In auxiliary disciplines, he found objective indicators that allowed him to study the evolution of psychoanalytic dialogue.

Alceu Amoroso Lima, also known by the pseudonym Tristão de Athayde, was born in Rio de Janeiro, on December 11, 1893, and died in Petrópolis, on August 14, 1983, close to his 90th birthday. He was the son of industrialist Manoel José Amoroso Lima and Camila da Silva Amoroso Lima. On his father's side, he was the grandson of the Viscounts of Amoroso Lima, a noble title of the Portuguese monarchy. He was the youngest of five children and did not fail to receive the maternal pampering that this condition affords, as he himself stated on several occasions. His education followed the trend of the time: literacy at his mother's home and later admission to the former National Gymnasium (now Pedro II High School), where he graduated in Humanities (Sciences and Letters) in 1908, a very common course in his generation.

After completing his basic education, Alceu enrolled in 1909 at the Faculty of Legal and Social

Sciences, directed by the Count of Afonso Celso, an institution of great prestige and recognition in that time. It was during his law degree that Alceu met Sílvio Romero, one of his main intellectual influences throughout his life, who had already been his teacher at the National Gymnasium. It was the time of the formation of “spiritual affiliations,” marked by a strong master-disciple relationship and the consequent creation of groups, associations, brotherhoods, clubs, and other forms and spaces for socializing, in a healthy opportunity for the exchange of ideas and opinions, not infrequently with ideological clashes and fights.

In 1913, Alceu received his bachelor’s degree in juridical and social sciences and left for France where he underwent a kind of intellectual turnaround after attending Henri Bergson’s courses at the Collège de France. It was in France that Alceu Amoroso Lima had contact with the most different currents of thought – philosophy, psychology, sociology, and literary criticism. Certainly, during this period of training in the French capital, he read for the first time about Sigmund Freud’s theories, which deeply marked him, leading him to spread the ideas of the Father of Psychoanalysis in Brazilian lands.

Back to Brazil, right after the outbreak of the First World War, he made a long trip through the countryside, especially Minas Gerais. As soon as he returned to Rio de Janeiro, he wrote his first book – *Afonso Arinos* (1922) – in which he began a particular branch of his academic production: social psychology. In this book, Alceu conducted a true investigation into the social and behavioral relationships of the country man attached to his environment: his local insertion, personal relationships, the force of the environment in driving one’s goals and priorities: “The historical element is indispensable for the true characterization of a work and even for its aesthetic understanding” (p. 126). By the “historical element,” Alceu understood man and his personal characteristics; and in the specific case of the interior of Minas Gerais, he stated: “Unconsciously, however, within this race, at work in the rough environment of Minas, the fiber was slowly forming which later allowed the emergence of the ‘Minas Gerais School’. The action of the environment was

evident in the emergence of this group.” (p. 137–138). In another perspective, analyzing the work of Euclides da Cunha, he concluded: “Only a rude and rough literature, crushed with tears, could have attempted a vague literary expression of this hell of ashes and dust. And not even then could it do so, by a phenomenon of unconscious mental representation, today explained by psychoanalysis.” (1922, p. 159).

Honestly, Alceu Amoroso Lima was not a professional in Psychology, his entire life was spent in teaching literature, in the intense production of literary criticism and as a catholic intellectual. As a literary critic, he followed the birth and decline of Brazilian modernism, having analyzed and divulged the main authors and works that shaped our literary modernity. However, in his large academic production of more than 130 published books, some titles explored dimensions of social psychology, especially in the sense of investigating the behavioral manifestations of the Brazilian people due to their social interactions. In fact, Alceu was interested in understanding the influence of situational factors in the environment on the individual’s behavior and how these issues were represented in the literary production of particular authors. In other words, Alceu Amoroso Lima’s interest in psychology came about through literary criticism in order to better understand the characteristics and vicissitudes of certain characters and plots in Brazilian literature.

He further developed this orientation in his book *Voz de Minas* (1945), in which he deepened his research on the collective psychology in relation to the state of Minas Gerais, its people, its way of life, and its traditions. He stated: “All the psychology of Minas Gerais, as in general all the phenomena, not only psychological, but also sociological, cultural and moral, that we will successively study in the course of this essay, are impregnated with this same spirit. To begin with, let us consider the man of Minas Gerais as we see him in his external aspect.” (p. 26). Alceu makes use of these and other aspects to understand the Minas Gerais behavior represented in plots and characters, especially in those works produced by the modernist literature from that Brazilian state. For the critic, the main characteristic of the Minas

Gerais ethos is sobriety, about which he examines: “We shall find it still, and with doubled energy, in the knights of all its psychological traits. It is a quality in which all the other traits of his personality participate. It is like a moral environment in which minerism bathes. [...] The man from Minas is first of all a sober person.” (p. 32).

It is worth remembering that the theories of the Freudian psychoanalysis were widely disseminated in Brazil by our modernist writers, especially poets. Names such as Mário de Andrade, Manuel Bandeira, Murilo Mendes, Jorge de Lima, Lúcio Cardoso, Octávio de Faria, Cornélio Pena – among others – discussed psychoanalytic issues in their exchanged letters, as well as quoted and talked about Freud in their literary production. Alceu Amoroso Lima, as literary critic, accompanied and analyzed this situation, considering it as a phenomenon of our modernity, especially problems related to the notion of the subconscious and how this could be perceived in poetry, particularly those alluding to surrealist images and themes.

In the field of literary criticism, Alceu Amoroso Lima was one of the first intellectuals to divulge Freudian work in Brazil. In his book *Freud* (1929), Alceu “presented” the person and the thought of the Father of Psychoanalysis to his readers in a skeptical and not very flattering way. Right at the opening of the book he stated: “I see in Freud a Nietzsche without genius. Both place man as the supreme being, as the highest link in the scale of beings. And, starting from the evolutionist dogma, which the biologism of the last century spread among the intelligences, they see in nature a simple preparation for Man, and in man the final explanation of the universe. Only, each of them has sought to focus on one aspect of man.” (p. 7–8). Alceu’s skepticism towards Freud is explained by his own position as a catholic intellectual, since we know that Catholicism has always had difficulties accepting psychoanalysis and its constitutive dynamics. At another point in the same book, Alceu talks about the subconscious, one of the subjects most dear to modernist poetry with a surrealist tendency: “Freud sees in man a creature of instincts subordinated to all kinds of influences and whose sublimation can only be done by harnessing all of these larval

forces of the human being. The vein of originality that Freud sought to explore, beginning with his studies of hysteria around 1890, was precisely the subconscious, what goes on in us independent of our will, the world of blind instincts and unconscious dreams.” (p. 9).

Thus, we can conclude that Alceu Amoroso Lima, one of the most important intellectuals of Brazilian thought, had a significant interest in psychology and its different areas. Certainly, what interested him the most was the debate about the behavioral differences of Brazilians and the literary representation of such particularities. He was also important in disseminating and problematizing the theories involving Freud and questions about the subconscious. His work is extensive, covering several aspects of intellectual life and reaching the most varied fields of human knowledge.

Lippmann, Hanns Ludwig

Born *Berlin (Germany) on April 22, 1921*

Died *Petrópolis (Brazil) on December 30, 1981*

José Felipe Vitor Machado
Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil

Keywords

Brazil · Psychology courses · Training of psychologists · Prominence in professional and scientific organizations

Lippmann's life trajectory, as well as his training and interest in different areas of knowledge, crossed cities, states, and continents. In addition to teaching and the activities carried out in the field of psychology, its recognition comes from the efforts to create six psychology courses in the state of Rio de Janeiro between the years of 1953 and 1976.

Son of James Lippmann and Martha Kurban Lippmann, he was born in Berlin in 1921 and, during his childhood, received his basic training at Graues Kloster. As a result of the National Socialist regime installed in Germany, he emigrated with his family to Brazil at the age of 16, where he continued his secondary studies, as he could not complete them in the traditional German gymnasium (Kruger, 2002).

After finishing high school, Lippmann entered the Benedictine monastery Nossa Senhora do Desterro (Our Lady of Exile), in Santos/SP. There, he studied at the Pontifical Institute for Higher Studies between 1940 and 1945, where

he graduated in philosophy and theology, with an interest in studies in theology and science of religion. Based on his personal convictions and in disagreement with his parents' Jewish beliefs, he converted to Catholicism, a religion to which he devoted both theoretical and practical efforts throughout his life. However, despite his interest in the Catholic religion, he was instructed by his religious superiors to dedicate himself to studies and university teaching, enrolling in 1945 at the School of Social Service of the Pontifícia Universidade Católica de São Paulo (PUC-SP) (Pontifical Catholic University of São Paulo).

In 1948, after completing the course at PUC, Lippmann defended his monograph on the theme of abandoned minors, in which he spoke about the behavior of these young people (Mancebo, 2001). Thus, he received the title of Social Worker and, in the following year, at the invitation of Father Paulo Bannwarth (1888–1975), he began to exercise higher education and to compose a position with the Rectory at the School of Social Service at PUC- Rio. Between 1949 and 1957, he took part in two courses in Social Work; from then onward, he showed great interest in psychology, so that, since entering the institution, he selected for himself the disciplines in this field with the aim of setting up a course in the area.

Thus, Lippmann started the creation of several psychology courses in the State of Rio de Janeiro: Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio) (Pontifical Catholic University of Rio de Janeiro) in 1953; the first psychology course in Brazil created before recognition of the profession in 1962; Universidade do Estado do Rio de Janeiro (UERJ) (State University of Rio de Janeiro), in 1964; Universidade Gama Filho (UGF) (Gama Filho University), in 1967; Universidade Santa Úrsula (USU) (Saint Ursula University), in 1968; Universidade Federal Fluminense (UFF) (Fluminense Federal University), in 1970; and Universidade Católica de Petrópolis (UCP) (Catholic University of Petrópolis), in 1976 (Kruger, 1991).

He served as head of the Social Services Division of the Policlínica Geral do Rio de Janeiro (General Polyclinic of Rio de Janeiro), annexed to Santa Casa da Misericórdia, between 1951 and

1954, where the psychology course at PUC-Rio was located. During the same period, he was a member of the Subcomissão de Terras e Colonização da Comissão Nacional de Política Agrária (Subcommittee on Land and Colonization of the National Agrarian Policy Commission), participating between 1952 and 1953. He was a member of the Comissão Nacional de Bem Estar Social (National Social Welfare Commission) between 1953 and 1954, as a psychologist at the Ministério da Educação e Saúde (Ministry of Education and Health). He also worked at the Manicômio Judiciário Heitor Carrilho (Heitor Carrilho Judiciary Hospital), where he was responsible for preparing technical reports.

Despite the great influence on professional practice and on the performance of teaching activities, with technical and administrative positions, Lippmann's academic production was limited to a few articles and theses for associate professor. Among them, we highlight the one in 1958 for free teaching in Educational Psychology at the University of Rio de Janeiro, currently UERJ, and two others for the chair of Educational Psychology. The caveat, in this case of the chair, is that the 1961 one was not defended for the Faculty of Philosophy of the University of Brazil, currently UFRJ, due to the cancellation of the competition; that of 1962 was aimed at the University of the State of Guanabara, currently UERJ, after its approval in a public examination (Kruger, 2009).

Throughout his career, he was responsible for founding and vice-president of the Sociedade Brasileira de Filósofos Católicos (Brazilian Society of Catholic Philosophers), where he participated in six international conferences on Philosophy held by the entity and worked as editor of the magazine *Presença Filosófica* (Philosophical Presence). Lippmann is also credited with running the Centro Dom Vital (Dom Vital Center) in 1980 and the lectures he held.

His trajectory ended prematurely. Lippmann suffered from a precarious state of health and

died at his home in Petrópolis, during the night, while he was studying. For Lippmann, his conception of the role of the psychologist included a broad education that would enable the psychology professional to have an integral knowledge of the human being; therefore, aspects of anatomy and spirituality should be integrated into this training.

Elizabeth Lira Kornfeld studied at the *Colegio Inmaculada Concepción de San Bernardo* (Immaculate Conception School of San Bernardo), Chile. In 1971, during the processes of change and political tensions that the country lived during the government of the Popular Unity (1970–1973), she graduated as a psychologist at the *Pontificia Universidad Católica de Chile* (Pontifical Catholic University of Chile). Lira has a vast track record in the field of so-called *political psychology*. Her career as a researcher began at the *Centro de Estudios Agrarios de la Pontificia Universidad Católica de Chile* (Centre for Agrarian Studies of the Pontifical Catholic University of Chile) (1971–1973) in the training and literacy program for peasants. After the coup d'état on September 11, 1973, most of the peasants participating in that program were arrested, killed, disappeared, or expelled from the country. This experience had a profound impact on the course of her professional career.

Between 1974 and 1977, she worked in the *Programa Interdisciplinario de Investigaciones en Educación* (PIIE) (Interdisciplinary Education Research Program) and from 1977 to 1980, at the *Instituto de Tecnología de los Alimentos de la Universidad de Chile* (INTA) (Institute of Food Technology of the University of Chile). In 1977, she joined the *Programa Médico Psiquiátrico de la Fundación de Ayuda Social de las Iglesias Cristianas* (FASIC) (Psychiatric Medical Program of the Christian Churches Social Assistance Foundation). In this institution, she began her work with victims and relatives of those who were persecuted by the regime of Augusto Pinochet

(1973–1990). About her work at FASIC, Lira recalls: “These were tortured people of all social classes, relatives of people who were executed, people, especially women, who unsuccessfully sought out their close relatives who had been arrested and whose traces had been lost” (Rivas Torres, 2000, para. 5).

In 1988, together with a group of professionals, they founded the *Instituto Latinoamericano de Salud Mental y Derechos Humanos* (ILAS) (Latin American Institute of Mental Health and Human Rights). Lira was its executive director from 1988 to 1994. The work and accumulated experience, both in clinical intervention and in research on human rights and mental health, led her to work advising different Latin American instances of reparation for the victims of dictatorships that in the second half of the twentieth century spread throughout Latin America. Since the 1990s, she has accompanied memory and reparation processes in countries such as El Salvador (1992–1996), Guatemala (1999–2001), and in recent years, Colombia. In the 1980s, she got to know closely and worked with Ignacio Martín-Baró (1942–1989) and other psychologists forming a network of collaborations and exchanges to deal with the psychological effects of the problems of Latin American societies confronted with inequality, dictatorships, and political violence (Lira et al., 2019).

In 1997, she joined the *Instituto Latinoamericano de Doctrina y Estudios Sociales* (ILADES) (Latin American Institute of Doctrine and Social Studies), an institution that gives rise to the founding of *Universidad Alberto Hurtado* (Alberto Hurtado University), where she has served as director of the *Centro de Ética* (Ethics Center) (2006–2013), and since 2014 as dean of the Faculty of Psychology.

From the perspective of political psychology, she has studied the individual and social effects of human rights violations, especially the effects of torture and traumatization, reflecting and proposing forms of therapeutic intervention with victims, considering historical-political conditions (Larrain & Hevia, 2017). In years of dictatorship, she edited and published under a pseudonym, due to the political persecution and repression also suffered by professionals, intellectuals, and academics. In 2017, she reedited *Lecturas de*

Psicología y Política (Readings of Psychology and Politics) and *Crisis Política y Daño Psicológico* (Political Crisis and Psychological Damage) (Lira, 2017), which bring together a series of works from the underground meetings held in 1980 by the *Colectivo Chileno de Trabajo Psicosocial* (Chilean Collective of Psychosocial Work) and were published under the pseudonyms of its authors in 1982 in Mexico for security reasons.

At ILADES, she initiated a research project on political reconciliation in Chile from its Independence in 1810–1994. This interdisciplinary research work has been developed with historian Brian Loveman, publishing a trilogy of books that has been an international reference to understand the phenomenon of political reconciliation from a perspective that addresses other moments in Chilean history where order has been imposed legitimizing political repression (Borzutzky, 2007). These books are *Las suaves cenizas del olvido. La vía chilena de reconciliación política 1814–1932* (The soft ashes of forgetting. The Chilean way of political reconciliation 1814–1932) (Lira & Loveman, 1999), *Las ardientes cenizas del olvido. La vía chilena de reconciliación política 1932–1994* (The burning ashes of forgetting. The Chilean way of political reconciliation 1932–1994) (Lira & Loveman, 2002), and *El espejismo de la reconciliación política. Chile 1990–2002* (The Illusion of Political Reconciliation. Chile 1990–2002) (Lira & Loveman, 2002).

Regarding the importance of her work on political reconciliation, Lira notes: “The proposed reconciliation was based on victims reneging on the experience of violence and abuse (and forgetting it) and that many should deny their social and political ideas and projects, as if social peace were the result of the silence of all victims and all those who, in one way or another, identified with them” (Rivas Torres, 2000, para. 13), so, from her analysis, the political reconciliation was invited to the closure of the conflict by ensuring impunity for all past acts, causing the denial of the experiences of the victims, which, no matter how much they were denied, were indelible to those who suffered them. However, there was the idea that giving a place in public discourse to these

experiences would be a political threat for the purposes of restitution of social peace.

Lira is a Chilean psychologist who has trained several generations of psychologists, lawyers, and mental health professionals in Chile and other parts of the world. She has been invited to teach and to give workshops for intervention teams in Argentina, Colombia, Costa Rica, Croatia, El Salvador, Spain, United States, Guatemala (Lira, 1997), Italy, Lebanon, Mexico, Peru, Syria, and Turkey, among other countries (Universidad Alberto Hurtado, 2017). In addition to her scientific profile, Lira has been a member of various official authorities in Chile: the *Mesa de Diálogo de Derechos Humanos* (Human Rights dialogue table) (1999), the *Comisión Nacional sobre Prisión Política y Tortura* (National Commission on Political Prisoners and Torture) (2004), and the *Comisión Asesora Presidencial para la Calificación de Detenidos Desaparecidos, Ejecutados Políticos y Víctimas de Prisión Política y Tortura* (Presidential Advisory Commission for the Qualification of Disappeared Detainees, Political Executees and Victims of Political Prison and Torture) (2010–2011), Chilean expert for the *Colonia Dignidad* Memorial Site (2019–today).

In her vast career, she has received dozens of national and international awards and recognitions: the *Premio Nacional Colegio de Psicólogos* (National Award Association of Psychologists) in 1983, the *Nevitt Sanford Award of the International Society of Political Psychology* in 1998, and the *International Humanitarian Award*, awarded by the American Psychological Association in 2002. In 2017, she was recognized with the highest distinction for scientists in Chile, the *National Humanities and Social Sciences Award*, being the first professional in psychology to obtain it. Lira is one of the women of the second half of the twentieth century and of the current era who continues to leave her mark on the formation (Hagenaars et al., 2020) of psychological science development for Latin America and the world: “For her courage and dedication to alleviating the psychological effects of state sponsored terrorism on the lives of people all over the world” (American Psychologist, 2002, p. 979).

medicine and traveled to Copiapó to teach philosophy as well as Spanish literature and grammar at the *Liceo de Hombres* (Men's High School) (Jónico, 1999). He was a pioneer of scientific psychology in Chile, with contributions and transcendental work on positivist psychology.

Lois dedicated his life to teaching philosophy, psychology, and positivism in the city of Copiapó. In 1878, he founded the *Academia Literaria del Liceo de Hombres de Copiapó* (Literary Academy of the Men's High School of Copiapó), and in 1882, he created the *Sociedad Literaria "Augusto Comte"* ("Augusto Comte" Literary Society) in homage to the French philosopher and founder of the positivist school (Jónico, 1999). In 1886, he founded the newspaper *El positivista: periódico filosófico, literario, científico i moral* (The positivist: philosophical, literary, scientific and moral periodical) to disseminate positivism, which was published between 1886 and 1889 (Jaksic, 1989; Memoria Chilena, n. d.). He produced many works, among which *Elementos de Filosofía Positiva* (Elements of Positive Philosophy), published in 1889, has a broad exposition of Comte's views and their application to logic (Jaksic, 1989; Salas & Lizama, 2013). In the section on philosophy, it is evident that he considered the affective life as a superior element that philosophers needed to systematize before they could understand the progressive and orderly march of human civilization. He believed that the superior affection, to which affections such as selfishness or love of family and country should be subordinated, was a love of humanity (Lois, 1906). In the preface of the second edition of the book, published in 1906, he claimed that psychology was intended for those who wished to deepen the philosophy and sciences of mind. In addition, he explained that this work could be useful for teachers and students (Lois, 1906).

Lois defined psychology as "the science devoted to the study of mental phenomena" (Lois, 1906, p. 41), adding that for this reason logicians base their work on psychology. He made a distinction between metaphysical psychology and positivist psychology, adhering to

the latter. The former studies the soul, its faculties, operations, and knowledge. For Lois, positivist psychology seeks to identify the natural laws that govern the evolution of mental phenomena, so that we could predict it and adapt man to humanity (Lois, 1908). He asserted that the study of mental phenomena would be successful only when the scientific laws that underpin organic life and the most elementary notions of animal life were understood.

Lois participated actively in different social spaces that served to publicize his work and allowed him to learn from other intellectuals and researchers. He was elected president of the Radical Assembly in 1901 and of the *Sociedad de Amigos de la Ciencia* (Friends of Science Society) in 1906. That same year, he became an academic member of the *Facultad de Medicina y Farmacia de la Universidad de Chile* (Faculty of Medicine and Pharmacy of the University of Chile) (Jónico, 1999). Shortly after his death, Venturino (1917) noted that Lois was also a follower and disseminator of the work of important logicians such as Aristotle (384–322 BCE), John Stuart Mill (1806–1873), Alexander Bain (1818–1903), and Wilhelm Wundt (1832–1920), which also influenced his psychology and pedagogy.

Lois' work focuses on topics related to the general laws of mental phenomena, postulates about the self, and theories about consciousness and emotions. He contributed to scientific psychology with his extensive knowledge of the natural sciences, philosophy, and social sciences, since the various psychological aspects converge through concepts such as the self, logic, will, feelings, and intelligence, all of which he approached with a comprehensive and scientific perspective (Lois & Vergara, 1956; Salas, 2013).

In the mid-twentieth century, Lois continued to inspire other academics, since his works and ideas were important for the development of psychology at the national level. He had disseminated various advances in psychology and pedagogy made mainly by European authors, such as the French psychologist Théodule-Armand Ribot (1839–1916), the Spanish neuroscientist Santiago

Ramón y Cajal (1852–1934), who received the Nobel Prize for his contributions, and the French educator Jules Payot (1859–1939), who dealt with the concept of volition. He studied and publicized the theories of important figures in psychology, such as Immanuel Kant (1724–1804), Herbert Spencer (1820–1903), and Wilhelm Wundt, among others (Lois & Vergara, 1956; Salas 2013).

Sociology · Eugenics

Luis López de Mesa was born in a town in Antioquia called Don Matías (now known as Azuero) in 1884. He studied medicine at Universidad Nacional de Colombia (National University of Colombia) where he graduated in 1912 (Ardila, 1973, 2013). Between 1916 and 1917, he traveled to the United States to pursue graduate studies and was admitted to the Boston Psychopathic Hospital, attached to Harvard University, where he specialized in psychology and psychiatry. The Boston Psychopathic Hospital was founded in 1912, as one of the most modern and efficient centers in the United States to treat mental patients. At the same time, it was created as a research and training center for psychiatrists and paramedical personnel (Rosselli, 1985). At that time, some important figures of psychology were at Harvard, among them Edwin Boring (1886–1968), Edward Titchener (1867–1927), William McDougall (1871–1938), and Hugo Münsterberg (1863–1916) who had recently died (Ardila, 1973, 2013). There, López de Mesa had the opportunity to study authors such as Emil Kraepelin (1856–1926), Eugen Bleuler (1857–1939), Alfred Binet (1857–1911), Lewis Terman (1877–1956), and others (Kalmanovitz et al., 1993).

This program undoubtedly influenced the medical and psychiatric thinking of López de Mesa as well as his later work as a thinker and writer.

Elmer Southard (1876–1920), a neuropsychiatrist and neuropathologist trained in Germany, was the director of the Boston Psychopathic Hospital and professor of psychiatry at Harvard University. Southard taught a totally organicist psychiatry, oriented toward the fact that the mental life of healthy and sick people depended on their brain structure (Rosselli, 1985).

Upon his return from Harvard, in August 1917, López de Mesa opened a psychiatric office in Bogotá, integrating the forefront of mental medicine in the country. Being a pioneer in the country, López de Mesa's first tasks were devoted to experimental psychology (Rosselli, 1985). Between 1918 and 1922, he complemented his studies in England and France, with sporadic excursions to countries such as Germany, Spain, Italy, and Greece (Runge & Muñoz, 2011). When he returned to Colombia, he opened again his office as a psychiatrist, where he began to write and organize his ideas on human culture, society, psychism, race, history, and evolution (Ardila, 2013).

López de Mesa was a physician, but he was also interested in sociology, psychology, and literature; he was a university professor, historian, essayist, novelist, poet, linguist, and humanist; he also held different and important public offices (Runge & Muñoz, 2011). His first work, *The Book of the Apologists*, was published in 1918 and then came *Contemporary Civilization* (1926), *On the Formation of the Colombian Nation* (1934), *Sociological Dissertation* (1939), *Us and the Sphinx* (1947), *Cultural Perspectives* (1949), *Sociological Scrutiny of Colombian History* (1956), *Panegyric Prayers* (1964), and psychological novels such as *The Tragedy of Nilse* (1928) and *Biography of Gloria Etzel* (1929) (Ardila, 2013).

His work, in regard to psychology, is found in several publications and has to do with normal and pathological human psychology and with the importance of evolution. He analyzed the work of Charles Darwin (1809–1882) and Herbert Spencer (1820–1903) in detail and became interested in instinctive animal behavior and its probable phylogenetic course (Ardila, 2013) and in areas such as developmental psychology,

language psychology, intelligence psychology, and personality psychology from not only theoretical but also an applied point of view. López de Mesa was heir to the functionalist and pragmatic influence left by William James (1842–1910) at Harvard, as well as Alfred Binet's (1857–1911) influence on the measurement of intelligence that echoed in the United States in Terman's work (Kalmanovitz et al., 1993).

In López de Mesa, two traditions met (Kalmanovitz et al., 1993): the first psychological and philosophical, which came directly from American functionalism and pragmatism. The second was medical and came from the organicist tendency of Emil Kraepelin (1856–1926), learned from Southard in North America.

In 1920, in a series of lectures on the problem of race degeneration, López de Mesa presented himself as a psychologist; it was the first time that a Colombian author introduced himself as such. In that event, he made a presentation based on a comparative analysis of the different races in Colombia (Kalmanovitz et al., 1993). Also, Medina Muñoz (cited by Ardila, 2013) says that he can be considered as the precursor of the psychological tests in Colombia, since he produced the first intelligence test made by a Colombian, based on the Yerkes-Bridges-Hardwick tests, as well as on Terman's tests. Unfortunately, this material was not published and has been lost (Ardila, 2013).

López de Mesa also worked as a professor of psychiatry, and in 1938, he was the ad honorem director of the *Manicomios de la Beneficencia de Cundinamarca* (Cundinamarca Charities Asylum) (Rosselli, 1985); later, he was the rector of the National University of Colombia, just at the time that the *Instituto de Psicología Aplicada* (Institute of Applied Psychology) was inaugurated on July 9, 1948 (Ardila, 2013). López de Mesa belonged to the *Academia Colombiana de Ciencias Exactas, Físicas y Naturales* (Colombian Academy of Exact, Physical and Natural Sciences); the *Academia Colombiana de la Lengua* (Colombian Academy of Language); and the *Academia Nacional de Medicina* (National Academy of Medicine), among others. He created

the *Cultura Aldeana* library to spread culture throughout the country (Ardila, 2013).

Starting in 1934, he entered public life as Minister of Education and increasingly moved away from everyday medical practice to a wider stage of international projection and writing (Rosselli, 1985). He was Minister of Education in the administration of President Alfonso López Pumarejo in 1934 and Minister of Foreign Affairs in 1938 under the presidency of Eduardo Santos, office he held again in 1945 during the presidency of Alberto Lleras Camargo. He was a great promoter of science, technology, industrialization, and navigation through the country's rivers (Ardila, 2013).

One of his most controversial research topics had to do with the concept of race in the study of Latin American and Colombian culture, the differential psychology of *mulatos* and *mestizos* based on the idea of "genesis unit" of instinct and intelligence (Ardila, 2013). In fact, in 1934, he wrote his work *On the Formation of the Colombian Nation*, where he studied the country and its people, analyzed the influence of its cultural groups (native American, Spanish, African), and described the influence of climate on different cultural and racial groups, the positive aspects of each group, and what he thought were their limitations or problems.

As a patient-treating physician, López de Mesa created the country's clinical history through its anamnesis, the study of its past crises, and the physical, mental, and social examination of the nation, to obtain a diagnosis and be able to outline a treatment:

His medical approach to the maladies of the country was the one that every clinician should have when faced with a patient: objective and attentive, with a sincere desire to succeed and help, committed to a strict scientific criterion and capable of facing risks even before the incomprehension of others (Rosselli, 1985, p. 41).

His 1934 book was written during the period between the world wars, where problems associated with the concept of race had a great preponderance. It was thought that there were superior and inferior races, so the problem of genetic determinism was fundamental. López de Mesa was

concerned with the problems derived from the concept of race throughout his career and proposed, despite of this, "emphasizing peasant education, nutrition, the solution of health problems (alcoholism, disease prevention), in the civilizing role of academies and universities, of popular culture and others" (Ardila, 2014, p. 75). His book proposes a psychological outlook to solve social problems, making him a pioneer of social psychology in our country.

This can be seen in his *Cultura Aldeana* (Village Culture) program, which he promoted in his public office as Minister of Education between 1934 and 1935, where he sought the progress of small populations, through a public education based on dissemination institutions such as cinema, broadcasting, and the collection of the *Cultura Aldeana* library, so that education could reach all citizens (Villegas, 2005).

As Runge and Muñoz (2011) say, López de Mesa expressed the spirit of his time (*Zeitgeist*) because he was one of the great Colombian intellectuals of the twentieth century who defended the "modern" ideas associated with progress. As examples of such ideas, he discussed the importance of science; the experimental method; the measurable, the visible, and the practical; and applied knowledge of disciplines such as experimental psychology, psychiatry, medicine, sociology, or anthropology, whose mission was to lead Colombia at the forefront of the civilization process of progress and improvement as a country.

For Runge and Muñoz (2011), López de Mesa expresses all the lights and shadows of that modernist movement to rebuild Colombian society, determined by the civilization process, secularization, laicization, and scientific nature of the world, but also dragging its inevitable perverse effects of segregation, exclusion, racialization, infantilization, medicalization, and sanitation of the population.

The proposal of Luis López de Mesa is part of a eugenic conception that is expressed in Colombia within the framework of active pedagogy, evolutionary sociocultural anthropology, and organic-positivist sociology, framed, all of them, in the socio-Darwinism of the nineteenth century. In López de Mesa, human action is eugenic, since it

aims to improve the human species (Runge & Muñoz, 2011).

In this regard, a characteristic of the hegemonic process aimed at the progress of modern and civilized man is that it uses classification parameters of human groups, where some are decadent and undervalued and others rational and civilized. A dark episode in the life of López de Mesa was his negative stand toward the migration of Jews to Colombia during the Second World War, when he was Minister of Foreign Affairs during the presidency of Eduardo Santos (Ardila, 2013). This prevented the possibility of giving asylum and life opportunities to those persecuted by the Nazi movement (Leal, 2013).

At the end of his career, López de Mesa wrote an article in 1954 called *Some Considerations About Man*. There, he criticized many of the psychological theories (conditioned reflexes, genetic evolutionary theory, behaviorism, brain localization theory or psychoanalysis and its derivatives) because they only reveal relationships and changes, but not the essence of the human being. He also criticized those that speak of the absolute, of the unknowable, of the unconscious, or of the self, calling them “ignorant nicknames of our own ignorance” (Kalmanovitz et al., 1993, p. 133).

López de Mesa’s work was broad and not only involved medicine but also disciplines such as psychology, sociology, philosophy, and literature. In the psychological field, he was the first Colombian to call himself a psychologist; he pioneered the development of psychological tests in the country as well as the construction of a social psychology, the importance of education for the development of the Colombian population, etc. As Ardila (2014) points out, however, his ideas had little influence on Colombian popular culture, probably because some of them were well ahead of his time.

López González, María Milagros

Born *on February 6, 1950, in Santurce, Puerto Rico*

Died *on December 1, 1997, in Santurce, Puerto Rico*

Dolores S. Miranda Gierbolini
Universidad de Puerto Rico, Rio Piedras, San Juan, Puerto Rico

Keywords

Puerto Rico · Social psychology · Epistemological shifts · Women studies · Post work

María Milagros López González is the daughter of two children born to Emérita González, from Utuado, PR, and Carlos Rafael López Balaguer, from Ponce, PR. She studied at a parochial school in Santurce, PR, and graduated from high school in 1968. She entered the University of Puerto Rico, Rio Piedras (UPR-RP) where she obtained a Bachelor of Arts degree with concentration in psychology in 1972 and Master of Arts with a specialty in psychology in 1973. She continued graduate studies in social psychology at the Graduate Center of City University of New York, obtaining her doctoral degree in 1976. Her dissertation studied strategies of self-assertion in the Puerto Rican women.

María Milagros López González became part of the faculty of the Psychology Department Program at UPR-RP in 1975 until her untimely death in 1997. She was part of the pioneer faculty teaching since the beginnings of the social community psychology area. As such, she made groundbreaking contributions to the epistemological and professional development of the initial master's degree program with a specialty in social community psychology and later in the doctoral program. She contributed with a social constructionist, social representations, and post-structuralist perspective, addressing the ideological underpinnings of psychology as well as society. She created courses and

research in women studies, gender, public policy, post work, and theoretical and conceptual shifts in social psychology. With Irma Serrano García (born 1948), she proposed a conceptual reorientation of the social community which is elaborated and published as the areas' document. It redirected the social change perspective of the area toward structural change.

María Milagros López is noted for a trans-disciplinarian and international approach in both teaching and research. She was among the first faculty member to shift to alternative methodologies. She integrated the arts and humanities to her teaching scenarios and research.

During her career, she was able to influence public policy for women, gender, and violence against women. This endeavor led to the foundation of the first service center for rape victims, Center for the Assistance of Rape Victims in 1977. She served as director of the Commission of Woman Affairs from 1979 to 1981. Her advocacy for women rights and justice was a nonstop journey which eventually contributed to legislation and policies for rape victims and violence against women. Her social commitment defied the threats to her life when she advocated in defense of the abortion centers in Puerto Rico. Her women studies approach provided a diversity outlook moving through the various phases it has shifted.

María Milagros López believed that professional licensing of psychologists, which in Puerto Rico goes beyond the clinical, counseling, and school specialty, is a threat to the academia. More so, she denounced that it entailed a shift toward the profession becoming more state oriented than academic or professional. Although her arguments were not successful and Puerto Rico today requires a license for practicing the profession, this controversy continues among psychology academics and professionals today.

Toward the end of María Milagros López's career, she dedicated her efforts to writing a book with her students. This book is directed toward a critical analysis of post work and social historical shifts toward a postindustrial society. Unluckily, due to her unexpected death, this document was not published.

Daughters Adriana Garriga López and Claudia Garriga López are currently into academia and research

López Rodríguez, Florente

Born in *Tamazunchale, San Luis Potosí, Mexico, on October 13, 1940*

Marina Menez

Universidad Nacional Autónoma de México, Mexico City, Mexico

Keywords

Mexico · Experimental analysis of behavior · Xalapa group

He studied high school at Preparatoria #1 “San Ildefonso” and was an undergraduate at the School of Philosophy and Letters of the National Autonomous University of Mexico (Universidad Nacional Autónoma de México) (UNAM), where he graduated as a psychologist in 1966. He worked as a vocational counselor for the Vocational Guidance Service at the National Preparatory School (Escuela Nacional Preparatoria) (UNAM). In 1965 he worked as a teacher at the Escuela de Psicología (School of Psychology) in the Facultad de Pedagogía, Letras, y Ciencias (Faculty of Education, Letters, and Science) of the Universidad Veracruzana (University of Veracruz) (UV) in the city of Xalapa de Enríquez. A member of the so-called Xalapa group, formed by Emilio Ribes Iñesta, Víctor Manuel Alcaraz Romero, Antonio Gago Huguet (born in 1940), and Gustavo Fernández Pardo, among others, he developed the first experimentally oriented curriculum in the country, as they were convinced of the need for psychology to adhere to a scientific outlook.

Besides teaching with a behavioral and methodological orientation, Florente López was in charge of the Centro de Entrenamiento y Educación Especial (Center for Special Education and Training) (antecedent of what currently is the Instituto de Psicología y Educación [Institute of Psychology and Education]) at the UV, a pioneer clinic focused on behavior modification that trained psychologists with this profile and dealt mainly with developmental disabilities. Through

the intermediation of Dr. David Ehrenfreund (1917–2007), who had known the efforts of the members of the emerging Xalapa group (Carrascoza 2009; 2018), Dr. James M. Crouner (1924–2015) visited the school. Dr. Crouner was the head of the Department of Special Education at Southern Illinois University and invited Florente López to study a master's degree at the Department of Behavior Modification at Southern Illinois University, the first of its kind in the United States (Carrascoza 2018). There he became familiar with the behavior modification in psychiatric patients program at Anna State Hospital, led by Nathan H. Azrin (1930–2013) and Teodoro Ayllon (born in 1929), basis of the "Token Economy" technique, and applied these techniques to dangerous inmates at the high-security prison in Chester, Illinois, where he took an internship.

Florente López was an adjunct instructor at the Department of Special Education of the University of Illinois and a research assistant at the Rehabilitation Institute. He wrote the chapter "Implementation of operant procedures for the treatment of handicapped children" (López 1972) in the book *Behavior Modification: Issues and Extensions* edited by S.W. Bijou and E. Ribes. In mid-1971 he returned to teaching at the Escuela de Psicología de la Facultad de Ciencias (School of Psychology in the Faculty of Sciences) of the UV and continued training students in behavior modification and operant conditioning research. Around that time, Dr. Luis Lara Tapia began recruiting teachers from the UV to implement an experimental curriculum at the UNAM's psychology course. In 1972, Florente López returned to his alma mater and aware of the need for a professional identity and the corresponding training, taught subjects such as learning, cognition, applied behavior analysis, research methods, and quantitative data analysis, among others. Shortly thereafter, the master's degree in experimental analysis of behavior (EAB) was created. Alongside Víctor Manuel Alcaraz, Emilio Ribes Iñesta, and Jacobo Grinberg-Zylberbaum, Florente López searched for an appropriate space for the new department (personal communication, 1994),

outside of university city. A colonial house in the Coyoacán neighborhood became its base from 1974 to 2001. Florente López joined the department, beginning the research into the temporal control topic. He was the head of the master's program from 1975 to 1980, a period he dedicated to strengthening the curriculum and seeing to the growing demand for international students, and from 1989 to 1991, a time in which he promoted the involvement of visiting teachers, such as Dr. John Eric Rayner Staddon (born in 1937), to share the theoretical and technological advances of the EAB. He was the founder of the Sociedad Mexicana de Análisis de la Conducta (Mexican Society for Behavior Analysis) and the *Revista Mexicana de Análisis de la Conducta* (Mexican Journal of Behavior Analysis), the first in Latin America regarding this field.

In 1977, as the head of Laboratory Coordination at the División de Estudios Profesionales (Professional Studies Division) of the Facultad de Psicología (Faculty of Psychology) of the UNAM, he created the Single Practices System (SUP) to provide students with the methodological skills to solve professional problems. The program was in force until 1990 and covered the first four semesters of the undergraduate course; it comprised teaching problem-solving strategies at an individual or social, single, or multi-dimensional level. Its implementation required coordinating the teachers to develop laboratory manuals to support the courses.

In the mid-1990s, with the financial support of the PAPIIT program (Programa de Apoyo a Proyectos de Investigación e Innovación Tecnológica) (Support Program for Research Projects and Technological Innovation), newly established in the UNAM, Florente López retook basic research with humans, specifically in the study of social interaction development. He proposed the use of sequential analysis in real time to study behaviors that reflect social and attentive skill development in infants and schoolchildren (López et al. 2005). He designed the SIRECC computer program (Sistema de Registro Conductual Computarizado) (Computerized Behavioral Registry System) (Torres et al. 1991)

for continuous behavior registration. He applied sequential dependency and time series techniques to analyze data relative to time and frequency domains. Many developmental researchers in Xalapa and in the UNAM have applied these methods and techniques to their studies on social interaction and violence (Vite and López 2004).

Florente Lopez continued his research in temporal learning and proposed investigating it as a process rather than a product (López 2012; López and Menez 2012). He developed experimental preparations to test the behavioral adaptation of the organism to temporally unpredictable environments, analyzing temporal learning trajectories and their mathematical modeling (Menez et al. 2017).

He partook in the proposal of the Cognitive and Behavioral Sciences field for the modification of the 2008 curriculum of the UNAM's psychology course. He developed quantitative data analysis programs from a model comparison perspective, a modern approach to statistical techniques teaching, and developed the original proposal of learning and adaptive behavior programs, axes of basic training in the new program.

Florente López led the empirical theses of over 50 undergraduate, graduate, and doctorate students; he published over 60 articles in specialized journals such as the *Journal of the Experimental Analysis of Behavior*, *Frontiers in Psychology*, *Behavioral Processes*, and *Early Child Development and Care*, among others. His papers reached over 200 citations in journals such as the *Journal of Applied Behavior Analysis*, *The Psychological Record*, *Chemosensory Perception*, *Psychology & Neuroscience*, and *Cognitive Psychology*. He has written four books and many book chapters as a coauthor alongside his students. He has also been a part of various editorial committees and developed tens of academic materials.

Upon his retirement, as a sign of the community's recognition of his contributions to psychology in Mexico and his dedicated academic trajectory over 45 years, an auditorium was named after him in the División de Investigación y Posgrado (Research and Postgraduate Division)

of the Facultad de Psicología (Faculty of Psychology).

One way to summarize the academic trajectory of Dr. Florente López, in his words, is that it was a career led by the conviction that productive academic life results from integrating psychological theory, practice, and research, an idea that not only applied to his own training but to that of his students.

López Rodríguez, Luis Humberto

Born *Jinotega, Nicaragua, on September 12, 1935*

Rose Mary Vega González and Maria Elena Humphrey

Independent professional, Managua, Nicaragua

Keywords

Nicaragua · Mexico · Psychotherapy · Transactional Analysis

Ramiro López and María Rodríguez, originally from the municipality of La Concordia, Jinotega, Nicaragua, were the parents of Luis Humberto López Rodríguez. He grew up in Jinotega, along with his eight brothers, in the rural environment of the northern region of the country. He completed high school in 1954, in the capital, Managua, at the Instituto Nacional Central Ramírez Goyena (Central National Institute, Ramirez Goyena).

He completed his medical studies at the Universidad Autónoma del Estado de México (Autonomous University of the State of Mexico, UAEM), returned to Nicaragua, and graduated as a physician, in 1962. His thesis work to graduate as a physician was about oligophrenia and its therapeutic approach. Social service, as an academic requirement in the medical career, did not yet exist in the country, so he practiced this social service on his own, for 10 months, in Yalí, Jinotega, in 1963. He returned to Mexico to study psychiatry at the Universidad Nacional Autónoma de México (National Autonomous University of Mexico, UNAM), between 1965 and 1967, and he trained, at the same time, in the practice of psychotherapy and in the teaching of medical psychology (Córdoba, 2014) (L. H. López, personal communication, October 21, 2020).

This training was in psychoanalytically oriented psychotherapy. He studied psychoanalysis with a former student of Erich Fromm (1900–1980). His studies in psychiatry included

an 8-month residency at Saint Elizabeth Hospital in Washington, DC, United States of America, in 1968. He studied a group therapy model, called *Community Therapy*. In this model, all hospital unit staff and patients were organized therapeutically (L. H. López, personal communication, October 21, 2020).

His learning of *Community Therapy* influenced his determination to use group therapy extensively throughout his clinical practice. Back in Nicaragua, he worked 6 months in the country's only psychiatric hospital, now called the Psychosocial Hospital José Dolores Fletes. There, he organized his patients under that model, but he received no support. Since then, he has worked as a psychiatrist in the private service. As a psychotherapist and psychiatrist, he uses individual and group therapy in his clinic.

In 1960, he began teaching while he studied medicine in Mexico, and this continued during his specialization in psychiatry. Durante 3 years, he was a professor at UNAM where he taught psychological medicine, medical psychology, psychiatry, and study techniques for medical students. He was also a professor of these topics and of neurology, at the Facultad de Medicina (School of Medicine) in Toluca, Mexico (Arellano, 2012).

In Nicaragua, he taught medical psychology and psychiatry at the school of medicine at the Universidad Nacional Autónoma de Nicaragua (National Autonomous University of Nicaragua, UNAN) in the city of León, from 1969 to 1979. He and three other psychiatrists initiated the psychology program at this university. They believed psychiatrists needed psychologists to assist them. At that time, psychiatrists took over the role of clinical psychologists, including administering psychological tests. In addition to this, the fact that, in Nicaragua, between 1968 and 1969, there was still no interest in psychology, a minimal role was assigned to psychology.

The group of psychiatrists, a school counselor, and the Dean of the Facultad de Humanidades (Faculty of Humanities), worked on the project of the school of psychology, approved by the University Council, its highest authority, in November 1968. It was started in 1969 in Managua, as the first Escuela de Psicología (Psychology School) in the country. López Rodríguez joined it as a

professor of Cultural Anthropology. From its inception, the school had a materialistic, non-Freudian philosophical orientation, given the strong influence of two of its founding psychiatrists, Dr. Mario Flores Ortiz (1917–1994) and Dr. José Pasos Marciaq (1935–2021).

He began teaching psychotherapy to the first, graduating class of the school of psychology, at UNAN-Managua, where he still teaches (2021). He was also a professor at the medical school of UNAN-Managua, founded in 1981. During that year, 1981, he was the Dean of this school and taught medical psychology and psychiatry, until 1993–1994.

He was the Dean of the School of Psychology of UNAN-Managua from October 1973 until 1977, after the political exile of Drs. Mario Flores Ortiz (1917–1994) and José Pasos Marciaq (1935–2021), which occurred because of their active opposition to President Anastasio Somoza Debayle's regimen, who controlled the country between 1967 and 1979, and was the last president of the Somoza family. Somoza ruled Nicaragua, from 1936, until 1979 (Anonymous, 2021; Martínez, 2018). At this time, the focus of the school was to train psychologists who were to be distinguished by their social commitment and by their work skills in different fields. Social interest was a criterion that was valued in the initial interviews of new students.

In the School of Psychology, under his direction, different analytical and therapeutic theories were part of the curriculum. During this period, an alliance was established with the Interamerican Society of Psychology (SIP). By 1974, with this initiative, there were also professional training processes in Transactional Analysis (TA) for psychiatrists and psychologists in the country. This was facilitated by professors from Argentina, from the International Association for Transactional Analysis (IATA), recognized by the International Transactional Analysis Association (ITAA).

Due to his psychodynamic and psychoanalytic training, he considered TA, of benefit for psychotherapy, and he taught it. It was relevant to professors of psychology at UNAN-Managua and at the Universidad Centroamericana (Central American University, UCA), to receive

training associated with the program of the Asociación Latinoamericana de Análisis Transaccional (Latin American Association of Transactional Analysis, ALAT).

In 1979, he was Vice-Coordinator of the Mental Health Program of the Ministerio de Salud de Nicaragua (Nicaraguan Ministry of Health). While working at this institution, he maintained ties with the School of Psychology of UNAN-Managua. At this time, the first mental health care teams were formed in the general hospitals and main health centers of the country, consisting of psychiatrists, psychologists, social workers, and nurses.

Psychiatrists from Latin American countries were invited to practice in Nicaragua since there were only 16 local psychiatrists in Nicaragua in 1979. Their cooperation helped achieve national coverage. Marie Langer (1910–1987, mentioned in Langer et al., 1981), a physician, psychoanalyst, and feminist of Austrian origin, highlights in her autobiography *Memory, History and Psychoanalytic Dialogue*, her participation as coordinator of Mexico's international mental health team, which supported the Sandinista revolution in Nicaragua, in 1981.

At that time, the coordination and direction of mental health services in the country, was implemented by psychiatrists. In late 1981, he worked for the Dirección de Medicina Superior y de Educación Continua en Salud (Department of Medicine and Continued Education) of the Ministry of Health and of UNAN, to develop the teaching and training in general medicine in the country. The social service of the physicians was initiated with academic support, as well as with a school to train nurses and nurse's aides, throughout Nicaragua.

He was Provost of UNAN-Managua between April 1983 and June 1990. He continued teaching the class named Medical Psychology, in medical school, assisted by a student. After a reorganization of university programs in the country, the School of Psychology of UCA was the only psychology program in the country, after the closing of the School of Psychology of UNAN-Managua in 1984. He continued teaching psychotherapy and psychopathology in UCA, at the beginning

of the 1990s, and provided attention in his mental health clinic, which had been newly inaugurated.

He returned to teaching psychotherapy at the School of Psychology of UNAN-Managua, from its beginnings in 1993, to this day. He believed that more opportunities for specialized training were needed in the country, to complement a bachelor's degree in psychology. He remarked that there have been traditionally more women than men studying psychology.

As a psychotherapy professor, he implemented a *psychotherapeutic marathon technique* with psychology and medical students since 1973. He gave lectures about *caresses* as a TA therapeutic method, and about the therapy of the child in older adults, at international TA congresses. He presented various topics about the psychology of older adults, and about the thanatological help provided by psychologists, through a radio program that he developed, for 12 years, and it is continued in 2021, called *Humberto López Live*, on Facebook (L. H. López, personal communication, October 21, 2020).

His interest in psychology has been evident in the field of sports psychology. Between 1992 and 2000, he wrote a Sunday column on sports psychology topics in the newspaper *El Nuevo Diario*. He wrote about 400 articles, with which he hoped to publish a book. Among these, there is one called *Women Change Sport* (López-Rodríguez, 1998).

UNAN-Managua's School of Psychology appointed him distinguished professor. Afterwards, this university awarded him an Honorary Doctorate in Humanities, on October 14, 2014. The School of Medicine appointed him Founding Teacher on December 11, 2015. On October 12, 2012, he received the Mariano Fiallos Gil Award, granted by the National Council of Universities (UNC), to academics from public universities.

He has promoted, led, or been an active member of associations of mental health professionals in the country, including the Nicaraguan Association for Transactional Analysis (ANAT), the Nicaraguan Psychiatric Association, the Nicaraguan Medical Federation (FESOMENIC), the Psychological Medical Institute (IMPEPSIN), the

Nicaraguan Association of Psychologists (ANIPS), and the Nicaraguan Foundation for the Third Age (FUNITE). With FUNITE, he promotes active aging and effective compliance with retirement rights by the state (Barberena, 2010).

He is indeed a part of history of psychology in Nicaragua, because of his education, training, experience, achievements, interests, leadership, and because of his professional practice. He defines himself as a psychiatrist and as a psychologist, and as the most *psychiatrist-psychologist* professional since he has trained and taught psychology students constantly throughout his professional life. When he practices psychotherapy, he emphasizes trying to understand symptoms and addressing the causes of the problem that bring patients to the clinic, rather than focusing only on the symptoms. He remains active in his private clinic and teaches psychotherapy online (L. H. López, personal communication, October 21, 2020).

Lucy Enid López-Roig is the oldest child of José Antonio López Puig from Humacao who worked in industry and later in sales. Her mother, Victoria Luisa Roig López, was from Utuado. She had a younger brother, José Antonio, and a younger, sister Adela. During her childhood and adolescence, Lucy López-Roig studied her primary and secondary education in parochial schools of San Juan, Puerto Rico.

After graduating from high school in 1954, Lucy's mother insisted that she attend college, hoping she would be more independent than women of her own generation. With financial help from her uncle, she enrolled that year at Seton Hill University in Greensburg, Pennsylvania. She arrived there alone on the train from New York, with limited English skills. Her years at Seton Hill were formative and influenced the

rest of her life. As a Puerto Rican woman, she overcame the prejudice and ignorance of her classmates. She consequently blossomed, by using her interpersonal and intellectual abilities, by the support of her friends, and by discovering her lifelong passion for the field of psychology.

Lucy López-Roig earned her bachelor's degree in psychology and sociology at Seton Hill in 1958 and then lived for several years with her family, who had settled in New York City. After a brief experience working as a switchboard operator, she found a job much closer to her talents, as a caseworker for the New York Foundling Hospital (1958–1960).

When her family returned to Puerto Rico in the early 1960s, she worked at the Puerto Rico Police Department as a psychometrist (1961–1966). Through her job in recruitment and selection of police officers, she learned about test construction and the organizational culture of the agency. From there, her next positions were in the human resources departments of the Puerto Rico Medical Center (1966) and the Puerto Rico Electric Power Authority (1966–1969).

While working full time, she earned her master's degree in clinical psychology in 1969 at the Instituto Psicológico de Puerto Rico (now Albizu University), a member of their first graduating class. Her mentor, Dr. Carlos Albizu-Miranda, was a graduate of Purdue University and encouraged her to continue her doctoral studies there. With the assistance of several scholarships, Lucy López-Roig moved to West Lafayette, Indiana, where she worked and studied at Purdue for 3 years (1969–1972), the only Hispanic student in her class. The faculty soon recognized the excellent clinical training she had received in Puerto Rico and assigned her to supervise other graduate students in psychodiagnostics and psychotherapy. On May 11, 1972, she was the first student to obtain a PhD in psychology with a double major in industrial and clinical psychology from Purdue University.

Dr. López-Roig then returned to the Puerto Rico Electric Power Authority as assistant executive director of Human Resources, becoming the first woman to occupy a position at that level in the organization (1972–1978). She led a team of

psychologists in implementing a dynamic organizational development and training program.

Lucy López-Roig worked as a professor at the Caribbean Center for Advanced Studies, now Albizu University (1973–1986). Her contributions to academia include the development of the first doctoral program in industrial psychology in Puerto Rico in 1979. She also served as professor of psychology (1973–1986) and director of the Organizational Development Program at the Interamerican University of Puerto Rico (1978–1987). She was the first Hispanic elected to the Board of Trustees of Seton Hill University in Pennsylvania in 1989 and remained in the Board for around 10 years (1989–1998). She was also a member of the Board of Trustees of the Ponce School of Medicine (today Ponce Health Sciences University).

In 1978, Dr. López-Roig and Dr. Marion Wennerholm founded Lucy López-Roig & Associates. With a team of industrial-organizational, clinical, and school psychologists, they offered services to business and educational institutions in Puerto Rico, the United States, and the Caribbean. These services included training and organizational development programs, change management interventions, organizational climate studies, the development of performance evaluation systems, and the development of programs for the prevention of the abuse of drugs and alcohol and violence in the schools. Their assessment expertise has been used efficiently by Latin American enterprises to assess candidates for executive positions since 1979. In 1984, the company established the first locally owned Employee Assistance Program (EAP) in Puerto Rico.

In 1993, she co-founded a nonprofit, volunteer, interdisciplinary community service program, Centro Beth Yash'Ah, which she led for 10 years. This center offered, among other services, family, individual, marital, and spiritual counseling. It employed volunteer psychologists, social workers, physician, lawyers, and priests.

In Puerto Rico, Dr. López Roig was recognized in 1984 as Citizen of the Year by the Chamber of Commerce. She was co-founder in 1985 of the Puerto Rican Council on Quality of Life, a committee devoted to studying issues related to

quality of life in San Juan, PR. In 1997, the Society of Industrial/Organizational Psychologists of Puerto Rico recognized her as a Precursor of Industrial/Organizational Psychology on the island. In 2000, she received a distinction by the Better Business Bureau for the promotion of ethical business practices. In 2001, Ernest & Young bestowed on her the *Entrepreneur of the Year, Lifetime Achievement Award* (Moreno-Velázquez, Justel-Cabrera, & Massanet-Rosario, 2006).

In 1997, during an event organized by the Puerto Rico Society of Industrial Organizational Psychology (SPIOPR), she addressed those present and exhorted them with the following words: “Have vision, have commitment, have perseverance and believe that there really is something beyond what we have here on earth. With this in mind, join together and don’t follow the path of divisiveness. Together, we will be much stronger as a discipline and as professionals” (López-Roig, 1997).

In 2005, she received special recognition from the Association of Psychology of Puerto Rico (APPR) for her contributions to the profession in Puerto Rico as an educator and through her professional practice. She was a member of the American Psychological Association (APA), the Society for Industrial and Organizational Psychology (APA, Division 14), and the APPR.

For Dr. Lucy López-Roig, psychology was her passion, of which she affirmed: “I was born a psychologist and throughout my career I have worked to create awareness of the employers’ social responsibility toward their employees and their quality of life” (L. López-Roig, personal communication, 1997).

Losada Silva, José Vicente

Born *Monagas, (Venezuela), 25 February 1936*

Died *Caracas, (Venezuela), 17 June 2013*

Narcy Álvarez

Federación de Psicólogos de Venezuela, Caracas, Venezuela

Keywords

Venezuela · Teaching · Neurolinguistic programming · Emotional development

He attended elementary school in Caripe, Monagas State. At the age of 12, he moved with his parents to Caracas to study high school at the Liceo Andrés Bello (High School “Andrés Bello”), where he graduated in 1952. At a very

young age, he developed a preference for literature, poetry and books in general, particularly humanism and existentialism, as well as psychology.

In 1956, he joined the ranks of the Partido Comunista de Venezuela (PCV) (Communist Party of Venezuela), actively participating in student struggles, which led him to be arrested and tortured by the police of the dictatorial regime that ruled Venezuela (1957–1958).

He entered the Universidad Central de Venezuela (UCV) Central University of Venezuela (UCV), in the program of medicine (1957), to specialize in psychiatry, a program that he abandoned due to the time lost in detention. In 1958, he began studying psychology at the UCV. Standing out as a student, he was hired in the last year of his undergraduate studies as an Assistant in the course of Professional Orientation. He obtained the degree of Psychologist in 1962 and began his teaching career in this same chair, where he remained for several decades until his death in 2013.

During his student life, he married child psychologist Alicia Gallegos de Losada (1941–), with whom he had two daughters. He trained in different areas of psychotherapy, group work, and university education, always framed in humanism. He studied postgraduate studies, obtaining a master's degree in Education at Columbia University, New York (1971), and a postgraduate degree in Group Dynamics at UCV (1977). In the same year, he was trained in Gestalt Therapy at the Instituto Venezolano de Gestalt (Venezuelan Institute of Gestalt) (IVG), between 1979 and 1980; he did a postgraduate study in Family and Brief Psychotherapy at the Mental Research Institute, Palo Alto, USA (1980). In 1980, he began his training in Psychodrama at the Escuela Venezolana de Psicodrama (Venezuelan School of Psychodrama), in Caracas. In the same year, he completed the Professional Training Group Inter Gestalt Therapy at the Institute for Gestalt Therapy New York USA. In 2001, he obtained a Master Practitioner in Neurolinguistic Programming (NLP) from the Instituto Español de Programación Neurolingüística (Institute of Neurolinguistic Programming) in Caracas, Venezuela.

Teaching, education, and the transmission of knowledge were his *raison d'être* and his professional north. Since 1962, he has taught different courses at the undergraduate and graduate levels at the UCV, mostly in the areas of counseling, psychotherapy, and group work. Between 1976 and 1989, he was a professor at the Escuela Superior de Guerra (War Higher College) at the Ministerio de la Defensa (Ministry of Defense). He was a postgraduate professor at the Universidad Simón Bolívar (USB) (Simón Bolívar University) (1989–1993), at the Universidad Pedagógica Experimental Libertador (UPEL) (Libertador Experimental Pedagogical University) in 1989, and at the Universidad Católica Andrés Bello (“Andrés Bello” Catholic University) (1990–1993). For several years, he was a guest professor at the Instituto de Estudios Superiores de Administración (IESA) (Institute of Higher Studies in Administration).

Parallel to the university teachings, he gave several trainings and workshops for different public and private organizations, where he divulged on various topics, among which we can mention: interpersonal communication, formation and development of work teams, change process, communication attitudes, and neurolinguistic programming (NLP).

He alternated teaching with the position of Director of the Escuela de Psicología (School of Psychology) at the UCV (1984–1986), a position he held despite the budgetary and financial difficulties the university was going through at the time. During his tenure, an exchange was achieved between the School of Psychology and the first Postgraduate Course of Child Dentistry, teaching psychological courses useful in the treatment and management of children in dental consultation, which led the students of the postgraduate course to give his name to that promotion.

Professor Losada dedicated his life to training psychologists, leaving behind a large number of students who followed in his footsteps and developed in the same line of action. He believed in change and emotional development and dedicated his life to that end. He was a member of the Colegio de Psicólogos de Venezuela (Board of Psychologists of Venezuela) since 1962 and

since 1978, under number 239, he was a member of the Federación de Psicólogos de Venezuela (FPV) (Federation of Psychologists of Venezuela).

Manuel Bergstrom Lourenço Filho completed his education at Largo do São Francisco Law School, in the city of São Paulo, in 1929. He initiated his professional practice in 1920 as a substitute

teacher at the Escola Normal de São Paulo (São Paulo Normal School), responsible for the discipline of Pedagogy and Civic Education. In the following year, 1921, he took on the teaching of Psychology and Pedagogy discipline at Piracicaba Normal School and at American School, where he began his research on writing and reading. In 1934, he created the ABC Tests to measure readiness for literacy, in which he used psychology to assess individual learning conditions, a resource that could enhance teaching (Catani, 2018).

One of the most relevant names in the history of Education in Brazil, Lourenço Filho was a protagonist in the implementation of the Education Reform of the state of Ceará, in the years of 1922/1923, allowing the foundation of the Psychology Laboratory at the Escola Normal de Fortaleza. Psychology had a privileged place in this reform for being considered, according to the New School concept, a fundamental instrument for the teaching activity, once it placed in primacy the training of teachers, for considering them to be the protagonists of teaching. The space was structured aiming the research’s development to offer training to teachers (Antunes, 2001).

In the chair of Psychology at the São Paulo Normal School, he succeeded Antônio Sampaio Dória (1883–1964), in 1925. Furthermore, he took over the institution’s laboratory directorship, where he reconstituted research activities and strengthened researcher’s groups. After 5 years, in 1930 – as General Director of Education for the State of São Paulo – based on the results of his test, he instituted the formation of homogeneous classes with the aim of contemplating individual differences in learning. In the same period, he conceived the Pedagogical Institute, the same place where the Applied Psychology service operated and in which the Educational Psychology discipline was instituted, hitherto unprecedented in higher education (Antunes, 2001).

In 1932, Lourenço Filho, together with Anísio Spínola Teixeira (1900–1971), taught psychology discipline at the Escola Normal do Rio de Janeiro (Normal School of Rio de Janeiro). Additionally, he also held the chair of Psychology at the National Faculty of Philosophy and at the University of Brazil and, in 1938, with the creation of the National Institute of Pedagogical Studies (INEP),

he was appointed director of the institution, where he could work and disseminate Psychology (Antunes, 2001; Catani, 2018).

The author's efforts were not limited to Education, given that he also contributed to the Departamento de Administração do Serviço Público (DASP) (Department of Public Service Administration), which operated from 1938 to 1986. This agency was created during Getúlio Vargas Government (1934–1945), with the purpose of organize the public work rationally in Brazil as a basis for the development of industrialization (Castro, 2011). His responsibility, in that agency, was to draw up selection criteria for psychologists to hire those who were seeking to join civil service (Antunes, 2001).

Regarding the work's positions occupied by Lourenço Filho, it is important to point out that he presided the organizing committee of the Psychology's Postgraduate Course at the Instituto de Seleção e Orientação Profissional (ISOP) (Institute of Selection and Professional Guidance) of Getúlio Vargas Foundation in 1947; (In 1970, due to changes in its structure, it was renamed the Instituto Superior de Estudos e Pesquisas em Psicologia da Fundação Getúlio Vargas Superior (ISOP/FGV) (Institute of Studies and Research in Psychology of the Getúlio Vargas Foundation).) he directed, in the same institute, the journal *Arquivos Brasileiros de Psicotechnica* (1949). In addition to these achievements, he was one of the founders, in 1931, of the Instituto para a Organização Racional do Trabalho (Idort) (Institute for the Rational Organization of Work) (Antunes, 2001).

He was co-founder of the Associação Brasileira de Psicologia (Brazilian Psychological Association), having as reference other associations on which he was a member, such as: Société Française de Psychologie, American Educational Research Association, and Institut d'Études Pédagogiques. The author is recognized as an important defender of the establishment and recognition of Psychology as a profession in Brazil, contributing to its regulation, which culminated in the approval of the Law 4119/62, which made him president of the commission responsible for psychologist's professional registration (Antunes, 2001).

His dedication to psychology led to important productions (technical and theoretical): ABC Tests – to verify the maturity necessary for learning to read and write, which had its first edition in 1933, but previously, in 1920, partial test results had already been released; Professional Orientation and Selection (1948); Current State of Motivation Psychology (1953); and Psychology in Brazil (1955). In addition, he translated important foreign works for the consolidation of Psychology and, in particular, Educational Psychology, such as: “Experimental Psychology, by Louis Charles Henri Piéron (1881–1964), and The School and Experimental Psychology, by Édouard Claparède (1873–1940), Education and Sociology, by David Émile Durkheim (1858–1917), and Tests for the Measurement of Intelligence, by Alfred Binet (1857–1911) and Théodore Simon (1872–1961)” (Catani, 2018, p. 102). The works aforementioned were part of his editorial and publishing efforts, during the time he directed the Biblioteca de Educação da Companhia Melhoramentos de São Paulo (Education Library of São Paulo Improvement Company), from 1926 to 1970 (Catani, 2018), in order to spread the production in Education.

Lourenço Filho was one of the signatories of the Manifesto of the Pioneers of New Education, in 1932, and in 1934, he presided over the Associação Brasileira de Educação – ABE (Brazilian Association of Education) (Antunes, 2001). He actively participated in the Escola Nova movement in Brazil, contributing to the reorganization of teaching and the improvement of the theoretical-practical qualification of educators, through research and contextual analysis of Brazilian education. These activities were carried out in different organizations, such as: National Council of Education, from 1937 to 1961; National Department of Education of the Ministry of Education and Health, in 1937; and the National Institute of Pedagogical Studies (INEP) in 1938. Both were reformulated, but remain in activity (Lourenço Filho, 1955).

Between 1947 and 1951, Lourenço Filho dedicated himself to the National Campaign for Adult Education, participating in the drafting of the Law of Guidelines and Bases for National Education (LDB), the first in Brazil, which was transformed,

in 1961, into the Law 4.024/61. His concern with adult education went beyond learning to read and write; its purpose was professionalization, consistent with the changes and conditions of the new world of work, that is, the incipient process of industrialization. As a result, the author considered it necessary to implement the principles of New School in Brazil, in order to provide access to education for all citizens, even if there were different purposes for each social class (Lourenço Filho, 1955). This initiative could only be implemented if there were wide scientific circulation; thus, his book *Introduction to the Study of New School* (1930), in addition to expressing his commitment to disseminate and implement such proposal, was also considered – by Fernando de Azevedo (1894–1964), in 1961, in the seventh edition – a primordial work in the history of Brazilian education (Catani, 2018).

Dr. Lucio y Gómez-Maqueo studied Psychology from 1962 to 1965, graduating in 1968 at the then Colegio de Psicología (College of Psychology) of the Facultad de Filosofía y Letras (Faculty of Philosophy and Letters) (FFyL) of the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM). She obtained a master's degree in 1971 and later a doctorate in 1976 at the Facultad de Psicología (Faculty of Psychology) (FP) (UNAM). Later she completed a specialty in Frommiano psychoanalysis at the Instituto Mexicano de Psicoanálisis (Mexican Institute of Psychoanalysis) (IMP) from 1977 to 1980 and took master's courses as a special student at the University of Queens, in Kingston, Ontario, from 1993 to 1994. She also has a Diploma in Narrative Therapy from the Instituto Latinoamericano de Estudios de la Familia (Latin American Institute for Family Studies), studying from 2000 to 2001, in Mexico City.

Lucio's teaching career began at UNAM in 1965, simultaneously in the Facultades de Medicina y de Psicología (Faculties of Medicine

and Psychology), as a teaching assistant. In 1973, she became a professor at the FP, the year of its foundation for the study of Psychology as an independent discipline of the FFyL for more of 50 years (Palafox, 2017).

Lucio has distinguished herself for her extensive academic and scientific career at UNAM, developed particularly in Clinical and Health Psychology, in which she has worked tirelessly for more than 52 years. She has made fundamental contributions to the three substantive functions of UNAM: teaching, research, and dissemination of culture. To date, she has taught more than 240 curricular courses at the bachelor as well as specialization and postgraduate studies at master's and doctorate's levels in diverse topics related to the areas of Clinical, Social, and Experimental Psychology. A main aspect of Lucio's courses has been to promote in her students adopting of high ethical standards in their professional development and the systematization of practical intervention activities based on high-quality scientific evidence.

As a teacher, she has contributed to the academic training of human resources in the undergraduate and postgraduate programs and has directed 86 bachelor's theses and dissertation, 10 specialty's theses, 59 master's, and 18 doctorate's, many of which have received honorific mention. She has participated in more than 100 postgraduate tutorial's committees and was a jury in diverse undergraduate and graduate evaluations, some of them in national and international institutions.

Her performance in the training of human resources is reflected in the careers of their former students, such as professionals, academics, and researchers who have distinguish in diverse areas of Psychology, for which they have received various awards for their work presented at national and international academic events.

Her performance as an academic has also been recognized outside of Mexico, so Lucio has been invited as a visiting professor-researcher at various higher education institutions, such as the University of Kent in Ohio, United States, during 2000; at the Universidad de la Frontera (University of the Frontera) in Temuco, Chile, in

2003 and 2008; and at the la Universidad Autónoma de Barcelona (Autonomous University of Barcelona), in Spain in 2005, where she has collaborated on projects as external researcher and advisor, giving courses and conferences on topics related to personality assessment, prevention of suicide, and adolescence (UNAM, 2019).

She is currently Associated Professor, C level, of the División de Estudios de Posgrado e Investigación (Division of Postgraduate Studies and Research) of the FP at UNAM, the highest degree in the category of "Full Time Career Professor." She has also been recognized for her academic work by the program that UNAM has established to support her academics, the Programa de Primas al Desempeño del Personal Académico de Tiempo Completo (Full-Time Academic Staff Performance Program) (PRIDE), which granted her the highest level that can be awarded since 1996. Its high level of productivity and the quality of its research work have earned it level III in the Sistema Nacional de Investigadores (National System of Researchers) (SNI), of the Consejo Nacional de Ciencia y Tecnología (National Council of Science and Technology) (CONACYT) of Mexico, since 2005 (Palafox, 2017; Ruiz, 2017; UNAM, 2019). In research's activities, she has also distinguished by her ability to coordinate groups of researchers. For example, she has developed 17 projects financed by the Programa de Apoyo a Proyectos de Investigación e Innovación Tecnológica (Program of Support for Research Projects and Technological Innovation) (PAPIIT) at UNAM and other dependencies of UNAM or CONACYT, in which she has incorporated undergraduate, master's, and doctoral students. Her academic work has been recognized in other countries for which she has participated as invited researcher in projects running, mainly, in Chile, Brazil, Spain, and the United States.

A large proportion of her research is related to risk factors and psychopathology in childhood and adolescence, which represents relevant contributions to the field of evaluation, intervention, and prevention of severe health problems mostly in Mexico; among these, stands up her research project "Design of prevention and intervention strategies for emotional problems in adolescents

based on risk factors.” She has also participated in international investigation, such as the Latin American Intelligence Study (SLATINT: Flores-Mendoza et al., 2018). Because of her sustained interest in the study of mental health, she has developed research that contributes to the prevention of suicide in adolescents based on the early identification of suicide risk, in order to carry out early intervention. For her contributions to this relevant field, she was invited to collaborate in the book *Prevention of Suicidal Behavior* published by the Organización Panamericana de la Salud (Pan American Health Organization) (OPS) in 2016, one of her selected publications.

Her research productivity is reflected in her numerous publications. Professor Lucio is author of 91 articles, 22 book’s chapters, and 10 books, one of which already has 4 editions. It should be noted that all texts have been refereed and published, both nationally and internationally, addressing topics such as personality assessment, psychotherapy, childhood, and adolescence (WorkdCat*Identities, 2019).

Her work in the evaluation area contributed to her becoming the leader of the Minnesota Multiphasic Personality Inventory standardization project in Mexico, aimed to get an adult version (MMPI-2), as well as an adolescent version (MMPI-A) in collaboration with Dr. Butcher (born 1933), leader of project at the University of Minnesota at Minneapolis, USA. The work of adapting these instruments for the Mexican population and Spanish-speaking people in adults (Butcher et al., 2007) as well as in adolescents (Butcher et al., 1998) involved the coordination and liaison, for several years, of a large group of team collaborators in Mexico and the United States.

Something that has distinguished Lucio is her contributions in the field of psychometry with the construction and validation of some psychological tests. Among the psychological evaluation instruments of which she is the main author are the Life Events Questionnaire, published in its first edition in 2003; the Self-Descriptive Inventory of Adolescents, published in 2009; as well as the Children’s Evaluation Battery in 2019, published by Manual Moderno (Modern Manual).

She also coordinated the revision and standardization of the MMPI-2 R (Butcher et al., 2015) and the MMPI-2 RF (Ben-Porath & Tellegen, 2015), both published in Mexico in 2015 and new versions of the previously standardized version, which are widely used in different areas of applied psychology.

A significant number of the instruments that have been developed or adapted by Lucio are used in various institutions in Mexico, Latin America, and Spain. Furthermore, these instruments have been used by undergraduate and graduate students to carry out their theses. Some of her books have had a prominent place in the training of psychologists in Mexico and other countries. It should be emphasized that Lucio is one of the Mexican psychologists who has collaborated as a co-author on books published abroad, in particular by the American Psychological Association (APA), for example, *Assessing Suicidality with Hispanic Adolescents*, published in 2013, which reflects other themes in which Lucio has investigated for years. Beyond the use of her books as texts in professional training, the impact of her academic productivity translates into multiple citations of her works, especially regarding articles, as well as in undergraduate and postgraduate theses.

On the other hand, she has participated in several collegiate groups at the university. From 1994 to 1998, she was member of the Technical Committee of Scholarships of DGAPA, by assignment of the rector of UNAM; as technical advisor to the FP in three periods (1993–2000; 2007–2013; and 2019–2023); and also as member of the respective Ethics’ Committee (2015–2019). She has been representative at the Academic Council of the Social Sciences Area, as well as member of opinion committees in different dependencies of the UNAM, for example, FP and Facultad de Estudios Superiores Zaragoza (Faculty of Higher Studies Zaragoza (FES-Z)). She is currently representative of the FP at the Graduate Council of UNAM. She has also held academic-administrative positions, such as coordinator of the Clinical Psychology Area of the División de Estudios Profesionales (Division of Professional Studies) of the FP (1992–1995). Since 2003,

Lucio coordinates the Residency in Child Psychotherapy at the Master Program in Psychology at UNAM. On behalf of the FP, she has been consultant to various institutions, such as the Secretaría de Relaciones Exteriores (Secretary of Foreign Affairs) and the Consejo de la Judicatura Federal (Federal Judicial Council), contributing to the generation of extraordinary resources for the institution, as responsible for a large-scale evaluation project, with the collaboration of several psychologists. Recently, as dean of the Council of the Faculty of Psychology, she was appointed Interim Director of the Faculty of Psychology. She has also served as a jury for several competitions and committees, she has also been part of editorial committees in several journals, and, also, she has collaborated in the organization of national and international academic meetings.

She is an active member of different national academic societies such as the Colegio Nacional de Psicólogos (National College of Psychologists), the Sociedad Mexicana de Psicología (Mexican Society of Psychology), the Sociedad Mexicana de Psicología Clínica (Mexican Society of Clinical Psychology), as well as the Asociación Mexicana de Suicidología (Mexican Association of Suicidology), of which she is founder and has been president, and international, such as the Sociedad Interamericana de Psicología (Inter-American Psychological Society), the Ibero-American Association for Psychological Evaluation (Sociedad Iberoamericana de Diagnóstico y Evaluación Psicológica), the Stress and Anxiety Research Society, and the International Association of Applied Psychology (IAAP).

In the field of culture dissemination, Lucio has taught over 170 refresher courses to date as an invited workshop leader at Congresses and as a tenured professor in the División de Educación Continua (Continuing Education Division) of the FP and in other institutions of higher education. Likewise, she has presented more than 200 presentations and keynote speeches at national and international congresses. In recent years, the doctor has frequently participated in interviews and press conferences in front of the various national media, collaborating with the Dirección General de Comunicación Social (General Directorate for

Social Communication) of UNAM to disseminate the contributions of the FP in solving national problems of social interest.

Her performance as an academic has contributed to her being awarded various awards and recognitions, such as the lifetime achievement award from the Sociedad Mexicana de Psicología (Mexican Psychological Society), in 201, the “Sor Juana Inés de la Cruz 2012” award given by UNAM (2019), the Premio Nacional (National Award) of the Consejo Nacional para la Enseñanza e Investigación en Psicología (National Council for Teaching and Research in Psychology) given in 2016 (UNAM, 2019), and the STAR Lifetime Career Award in 2017, granted by the Society for Stress and Anxiety (Buchwald et al., 2019; Palafox, 2017; Ruiz, 2017).

In sum, the career of Dr. Ma Emilia Lucio y Gómez-Maqueo, as an academic and professional, places her as one of the outstanding and recognized Mexican psychologists, for her contributions in relevant topics of mental health, from the field of research, science, and teaching, a fundamental amalgam that contributes from science to human well-being.

Mexico · Educational psychology · Special education

Dr. Macotela, following the tradition of her parents, manifested her commitment and identity with the Universidad Nacional Autónoma de México, UNAM (National Autonomous University of Mexico) throughout her academic career. In 1967 she began her university studies at the then College of Psychology; in 1976 she completed her master's degree in experimental analysis of behavior at the Faculty of Psychology and, in 1992, her doctorate in general experimental psychology.

She argued that Mexico required profound changes that could only be achieved through improved education. In all the projects she led, her concern to establish a clear link between psychology research and the solution of educational problems is clear. In all of her projects, a constant search for alternatives based on shared responsibility

among parents, students, researchers, and professionals in training is present.

Her contributions to psychology were in special education based on the experimental analysis of behavior and different models of educational evaluation, specifically in the proposal of models of specialized training in psychology; diagnosis and treatment of learning problems; poor performance and intellectual disability; educational integration; the creation of psychoeducational assessment tools; and self-regulated learning applied to written expression.

In 1977, in collaboration with Dr. Ely Rayek and a group of parents, she founded the Centro de Estudios en Psicología Humana (Center for the Study of Human Psychology), the first community service center of the Faculty of Psychology, UNAM, dedicated to the care of children with intellectual disabilities; in 1999 she led the work for the creation of the Residency Program in School Psychology for the master's degree in the Faculty of Psychology, UNAM, pioneer in the Faculty in teaching oriented to the development of competencies; in 2000 she collaborated with Dr. Rosa del Carmen Flores, in the creation of the Program "Achieving Success in High School" ("Alcanzando el Éxito en Secundaria"), dedicated to addressing learning difficulties in secondary school through innovative educational proposals, the development of technological tools for learning and proposal to improve in professional training.

Dr. Macotela developed a model for psychologists' in-service training to participate in pre-school facilities and primary and secondary schools, through which she articulated: the training of professionals in real situations with expert supervision, the generation of applied research and technology, and qualified professional service to students, parents, and teachers. She emphasized that psychologists in training should have authentic professional experiences, learning to collaborate with peers and related professionals, instilling in them the motivation for lifelong learning and respect for professional ethics (Jiménez & Macotela, 1983; Macotela, 2007). Several universities that invited her to take part as a guest professor, lecturer, advisor, and program evaluator adopted her ideas.

Her conception of educational assessment went beyond the idea, in force in the last century, to evaluate only to diagnose a problem and put the emphasis on the individuality of each student. She conceived psychoeducational assessment as a dynamic process of obtaining information to make judgments and support decisions about the creation of situations to strengthen, resolve, or improve the conditions that ensure effective learning for a student. For her, the great challenges of evaluation were (and continued to be) developing forms of evaluation sensitive to the needs and characteristics of each particular student; to recognize the psychological impact of evaluation on the student; to promote shared responsibility and the habit of self-evaluation; to establish it as a mechanism of accountability to society, and, above all, to articulate its results with the students' learning process (Macotela, 2004). Based on these purposes of the psychoeducational evaluation, Dr. Macotela directed the design, development, and evaluation of two instruments that continue to be of benefit in psychoeducational intervention and assessment. Both assume a prescriptive diagnostic character because while identifying skills, objectives for instruction are established. The instruments are the Academic Execution Inventory for the identification of difficulties in reading-writing and elementary mathematics and the Inventory of Basic Skills for children with intellectual disabilities. Both provide information with

which teachers can establish preventive, remedial, or learning promotion actions and have been used in various researches (García-Cabrero et al., 1992; Guevara & Macotela, 2005) that Dr. Macotela has led or collaborated on. Likewise, she also dabbled in the proposals for authentic evaluation, specifically in the use of evidence portfolios for the development of writing.

To favor educational integration, she argued that classroom resources and student-centered attention, rather than labeling, are critical given that to integrate a student means to coordinate the efforts of the school, parents, and teachers, seeking to achieve common goals with shared teaching proposals in educational spaces (Macotela, 1999). Learning disability is an example in which she notes that integration represents a huge challenge that, despite of the debate among specialists, consensus has not been reached and there are no suitable means to identify them and generate required support. She raises the need for the difficulties faced by these students to be conceptualized in terms of their ability to respond to instruction as expected. Supporting students requires a comprehensive evaluation of classroom and student resources, as well as adjusting supports based on strengths and weaknesses. That is, understand how the student learns as a basis to determine how to teach them (Macotela, 2006). An example of these intervention alternatives is her work in relation to reading and writing, which integrates strategic teaching, the development of self-regulated learning, training, and collaboration with teachers (Cortés et al., 2001; Guevara & Macotela, 2005; Macotela et al., 2002; Vega & Macotela, 2007).

She was a guarantor of the alternatives that psychology can offer for the improvement of education and for this reason received various recognitions: the National Prize for Teaching in Psychology granted by the Consejo Nacional para la Enseñanza e Investigación en Psicología, CNEIP (National Council for Teaching and Research in Psychology in Mexico) in 2006; the Rafael Santamarina Solá Special Chair granted by UNAM in 1991; and her membership to the National System of Researchers of the National Council for Science and Technology from 2001 to 2006.

To continue her legacy, in Mexico the Fundación Doctora Silvia Macotela (Dr. Silvia Macotela Foundation) was created in agreement with UNAM in 2008.

Affectivity · Interpersonal relationships

Abigail Alvarenga concluded her major in Pedagogy in 1951, at the Universidade de São Paulo – USP (University of São Paulo). At a time when women were not encouraged to pursue advanced education, she was one of the Brazilian women avant-garde by attending the Master’s in Education Program at Indiana University, IU

Bloomington, EUA, in 1963–1964. Advised by Harold G. Shane (1914–1993), she developed the research entitled *Conditions to facilitate interpersonal relationships*, which focused her mostly challenging theme: interpersonal relationships.

She attended the post-graduate program of Psicologia da Educação (Doctoral Program in Educational Psychology) at the Pontifícia Universidade Católica de São Paulo – PUCSP (Pontifical Catholic University of São Paulo), 1973–1976. As Joel Martins (1920–1993) advises, she developed the research *Formal Logical Analysis of Carl Rogers’ Learning Theory*, based on the researcher who had great influence both in her personal and professional life.

Abigail was entwined with education since her concluding a Foundation Degree in Primary Teaching and Learning. Upon earning a degree in Pedagogy (1951), she became a Secondary School teacher in the Public Education System of the state of São Paulo, teaching at Primary Teaching and Learning Foundation Programs throughout the state. According to the Secondary School Organic Bill (n° 4.244, 09 Apr. 1942) private schools were only allowed to offer Primary Teaching and Learning Foundation Programs if there was one teacher nominated by the government to teach one or two subjects, and to act as course supervisor. Abigail Mahoney was, then, appointed to work in several country side cities.

After some years, she was encouraged by Prof. Joel Martins to apply for a 6-month scholarship to intern at universities in the USA. There she attended her master’s degree at Indiana University in 1963–1964. She lived in the United States until the end of the 1960s, when she returned to Brazil with the title of Master, a husband, and two children.

It was in 1970 that she was invited by Joel Martins to work at PUC-SP in the recently created post-graduate program of Educational Psychology (1969) and started her activities at the institution. There, she took teaching and administrative duties as a professor, advisor, coordinator, researcher, and editor of *Revista Psicologia da Educação* (Educational Psychology Journal), where she remained as Full Professor until 2006, when she retired.

Retirement, however, did not lead to her leaving the academic activities since she continued participating in examination boards at PUC-SP and other universities, and in presentations in scientific events. Between 2006 and 2010, she was president-director of Fundação Aniela e Tadeusz Ginsberg, named in honor to the couple Aniela Ginsberg and Tadeusz Ginsberg (1902–1986) to encourage studies and research in Psychology along undergraduate students at PUC-SP.

While working at the Educational Psychology Program, she held lectures in several courses, and did research that resulted in master's and doctoral students mentoring, having supervised 55 studies.

Her skillfulness as a professor, researcher, and adviser shows on the different topics she covered, part of which focused on the conditions of the Brazilian educational background. Another part of her work, however, presents theoretical and conceptual reflections over different theories in Psychology. She was a scholar and communicator of constitutive concepts and principals of David Ausubel's (2018–2008), Carl Rogers's (1902–1987), and Henri Wallon's (1879–1962) proposals, having introduced these authors' theories through the courses she offered, and the study groups she coordinated in post-graduation.

Coordinating and being a member of study groups was a facet of Abigail Alvarenga Mahoney, whose work always excelled in the study of the theories on which her research was based, aiming at correctness, clarity, and concept delimitation for scientific knowledge.

One of the first study groups she gathered started in the 1970s, within the Educational Psychology post-graduation program of PUC-SP. At that moment, post-graduation in Brazil was particularly marked by their courses, not by their study groups, nor by developed lines of research. That is one more example of Abigail Alvarenga Mahoney's innovative work, by creating the Carl Rogers Study Group, with both professors and master's students. She was one of the main disseminators of Rogers' theories in Brazil, which had significant impact on the national scientific production in Psychology.

In the 1990s, when the studies on Wallonian psychogenetics were coming to PUC-SP by her

initiative, Abigail decided to dwell on Henri Wallon's theory, creating a new study group. So, in 1994, she started coordinating the Wallon Group, also counting on the participation of professors and students, both from Educational Psychology Program and from other institutions. She would often refer to Wallon Group as "a place to share knowing and not knowing; I do not know everything, and I want to learn along with you" (Almeida, 2001, p. 139).

Those words clearly reveal Abigail Alvarenga Mahoney's attitude and respect toward the theoretical approaches she embraced, her students, fellow professors, and researchers. Being and living the academic activities through that perspective, both as a professor and a researcher, she allowed her students and advises not only cognitive learning, but also values and a way to act professionally.

She passed on in Perdizes, São Paulo, in her residence near PUC-SP, to which she dedicated most of her professional life with vigor and compromise.

Maldavsky, David

Born *in Buenos Aires on February 2, 1941*

Died *in Buenos Aires on May 29, 2019*.

Liliana Haydee Alvarez and Nilda Elena Neves
Grupo Psicoanalítico David Maldavsky, Buenos Aires, Argentina

Keywords

Argentina · Psychoanalysis · Undergraduate and graduate Psychology programs

His family was composed by his father, Samuel Maldavsky, his mother, Adela Linschisky, and her

minor sister, Susana Mabel. In 1965 he married Clara Roitman, a psychologist, with whom he had two daughters, Miriam and Noemí, who gave him four grandchildren.

He completed his elementary studies at a state school in the Villa del Parque neighborhood. The high school cycle began at the Hipólito Vieytes School of Commerce and ended at the Bartolomé Mitre National School, all of them in Buenos Aires city.

His early influences were linked to the Russian and Romanian origins of his grandparents: the maternal, a spiritual man, knowledgeable about Kabbalah and Hasidism and the paternal grandfather, a man integrated into the urban culture of Buenos Aires, whom he did not know, but from whom he inherited his name.

Music lover, he studied piano for years. He began working as a librarian in the Department of Cadets of the Sociedad Hebraica Argentina (Argentine Hebraic Society) at the age of 18, where he was part of the group “Library rats.”

Initially turned to letters, he graduated in 1973 at the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) of the Universidad de Buenos Aires (University of Buenos Aires, UBA). Later, in 1977, he obtained his PhD in Philosophy and Humanities at the same University. His first publications dealt with the narrative of prestigious Argentine writers, such as Roberto Arlt (1900–1942) and Adolfo Bioy Casares (1914–1999), and a *Teoría Literaria General* (General Literary Theory) (Maldavsky, 1974).

Attending the seminars of Dr. Ángel Garma (1904–1993) at the UBA Facultad de Medicina (Faculty of Medicine) marked his first encounters with psychoanalysis and a change of course in his interests. In parallel to the preparation of his doctoral *dissertation*, he began in solitude, with the reading of Freudian texts. Already in contact with his teacher David Liberman (1920–1983), he began a fruitful collaborative trajectory that culminated in the publication of the co-authored book, *Psicoanálisis y Semiótica* (Psychoanalysis and Semiotics) (Liberman & Maldavsky, 1975).

He maintained personal contact with Argentine psychoanalysts such as David Liberman

(1920–1983), José Bleger (1922–1972), Herbert Rosenfeld (1910–1986), Isidoro Berenstein (1932–2011), Ángel Garma (1904–1993), Arnaldo Rascovsky (1907–1995), Ricardo Etchegoyen (1919–2016), and Fideas Cesio (1922–2012). He studied the work of León Grinberg (1921–2007), Enrique Pichon Riviere (1907–1977), and Marie Langer (1910–1987), as well as the work by Alfred Bion (1897–1979), Jacques Lacan (1901–1981), Melanie Klein (1905–1960), René Spitz (1887–1974), Donald Winnicott (1896–1971), Didier Anzieu (1923–1999), René Kaës (1936–), Francis Tustin (1913–1994), Pierre Martí (1918–1993), Helene Deutsch (1884–1982), Piera Aulagnier (1923–1990), among others.

His book, *Teoría de las representaciones* (Theory of representations) (Maldavsky, 1976), marked the beginning of the stage dedicated to psychoanalysis, in which it is possible to differentiate three periods.

The first is dedicated to *metapsychology*, in which he developed and refined fundamental concepts linked to the constitution of the mental apparatus and neuroses. An illustration of this period can be found in his chapter “Transformaciones representacionales constituyentes del aparato psíquico en la adolescencia,” which was part of Susana Quiroga’s book, *Adolescencia: de la metapsicología a la clínica* (Adolescence: from metapsychology to clinic), published by Amorrortu. For his part, in his book *Estructuras Narcisistas* (Narcissistic Structures) (Maldavsky, 1986), he developed a theory capable of encompassing and conceptualizing narcissistic, psychotic, and non-psychotic cases. He also understood the developments related to the theory and clinic of relationship structures, just as he understood the groups, family and couple.

The second phase was focused on what he called *patologías del desvalimiento* (pathologies of helplessness). For this he founded core concepts such as *intrasomatic libido* and *affection dismissal*, with which he specified the theoretical bases to account for toxic and traumatic affections. To this stage correspond fundamental books such as *Teoría y clínica de los procesos tóxicos* (Theory and Clinic of Toxic Processes) (Maldavsky, 1992), *Casos atípicos* (Atypical

Cases) (Maldavsky, 1998), and *Linajes abúlicos* (Abulic Lineages) (Maldavsky, 1995). Likewise, books based on social phenomena rather than clinical cases such as *Judeidad. Modalidades subjetivas* (Jewishness. Subjective modalities) published by Nueva Visión Publishing House in 1993.

The last period was focused on the development of a systematic instrument for the research of language in psychology and psychoanalysis, the *David Liberman algorithm* (ADL). This method, of fundamental origin in Freudian theory, studies discursive manifestations from the analysis of desires and normal and pathological defenses, including their state. One of the first works devoted to this topic was *La investigación psicoanalítica del lenguaje* (Psychoanalytic language research) (Maldavsky, 2003).

His contributions extended to Argentina, Brazil, Uruguay, Chile, Spain, England, and France. For 20 years he was a tenured professor at the Universidad del Salvador (University of Salvador). In 1994 he was appointed dean of the Facultad de Humanidades y Ciencias Sociales (Faculty of Humanities and Social Sciences) at the Universidad Hebrea Argentina Bar Ilan (Argentine Hebrew University Bar Ilan), within which he created as a postgraduate degree in the area of psychology the Maestría en Problemas y Patologías del Desvalimiento (Master Program in Problems and Pathologies of Helplessness), until the closure of the university in 1999.

Since 1999 and until his death, he directed the Instituto de Altos Estudios en Psicología y Ciencias Sociales (IAEPCIS) (Institute of Higher Studies in Psychology and Social Sciences) at the Universidad de Ciencias Empresariales y Sociales, UCES (University of Business and Social Sciences), within which areas for research were developed, as well as publications that included two peer-reviewed journals and an also academic sector that included the Doctoral Program in Psychology, a Master Program in Pathologies of Helplessness, a Diploma in Gender Studies, and other graduate specialization programs.

He taught seminars, courses, and conferences in the main psychoanalytic and university

institutions of the country and abroad, in Brazil (Catholic University of Porto Alegre), Spain (University of Salamanca, Complutense University of Madrid), France (University of Paris VII, Faculty of Bordeaux Medicine, University of Lyon, University of Caen), Israel (Hebrew University of Jerusalem), and Great Britain (London School of Economics, Anna Freud Center).

Throughout his career he received awards such as the Consulting Grant by International Psychoanalytical Association (IPA) for the research “Discourse analysis and psychic currents” in 2010. In 1909, both the Research Grant by IPA for the research “Discourse analysis and psychic currents” and the Research Grant by the Royal Society, UK (International Joint Projects 2009/R1) for the study of “Natural language processing (NLP) tools applied to the discourse analysis in psychoanalysis.”

Subsidies were also awarded. In 2010, from the Foncyt, a program at the Agencia Nacional de Promoción Científica y Tecnológica (National Agency for Scientific and Technological Promotion) within the Ministerio de Ciencia, Tecnología e Innovación Productiva (Ministry of Science, Technology and Productive Innovation) for the scientific meeting on “Natural language processing tools (NLP) applied to discourse analysis in Psychology. In 2008 for carrying out the project: “The gap between SMEs and auxiliary organizations. An approach from the problem of small entrepreneurs and intersectoral communications.”

Based on his deep knowledge of Freudian work, Maldavsky underlined certain concepts and went further, constructing theory from questions that Freud left open. The creativity and originality of his postulates, by deepening issues such as *original consciousness*, are a contribution to the clinic in pathologies that exceed the field of Neurosis and Psychosis, giving rise to psychosomatic conditions, addictions, traumatic neuroses and collective, disability, family violence including them in pathologies linked to the ego’s helplessness in the face of the drive.

From the epistemological point of view, Maldavsky argued that Psychoanalysis is a science and that studying subjectivity must be compatible with maintaining a strong methodological

rigor (Maldavsky, 2000). This led him to deploy a scientific project in an academic environment, considering that the university institution with its demand and rigor was the most appropriate context to develop a project of these characteristics. In this framework, he developed the ADL research method that has been used in multiple and varied investigations, both in Argentina and in other countries, and presented at national and international conferences and specialized congresses.

David Maldavsky’s outstanding trajectory deserved wide recognition and tributes after his death. Among others, to have given his name to the Instituto de Altos Estudios en Psicología y Ciencias Sociales of the Universidad de Ciencias Empresariales y Sociales IAPCIS “David Maldavsky” (Institute of Higher Studies in Psychology and Social Sciences of the Universidad de Ciencias Empresariales y Sociales IAPCIS “David Maldavsky”). Also the tribute by Aparain and Wainer at the 2nd International Meeting on “Serious Psychopathologies” held in Cuernavaca in 2019. Or the tribute in 2020 at the Argentine Psychoanalytic Association by Bodni, Manson, Marucco, and Quiroga, entitled “A la hora de evocar a David. Homage to Dr. David Maldavsky.” Beside those recognitions, a lot of tributes were published in well-known journals (Alvarez et al., 2019; Burstein et al., 2019; Título, 2020, among others).

Malgrat García, Carlos Manuel

Born in the city of Havana, Cuba, on March 9, 1918

Died in Panama City, Republic of Panama, on July 11, 2016

Ericka del Carmen Matus García
Universidad Especializada de las Américas,
Panamá, Republic of Panama

Keywords

Panamá · Cuba · Clinical psychology ·
Forensic psychology · Applied hypnosis

Malgrat Garcia studied homeopathic and cybernetic medicine (1952) and a degree in psychology (1953), both at the National Technological University, Havana, Cuba.

Migrated to Panama in 1954, where he was nationalized and obtained professional suitability number 140, through the *Technical Council of Psychology of Panama*.

His professional career began as a physician at the Institute of Mental Hygiene and Neuropsychiatry of the Municipality and at the National Hospital of Dementia both in Havana, Cuba.

In Panama, he worked in the Department of Correction of the Ministry of Government and Justice as director of the vocational school Justo Arosemena, of the Directorate of Social Welfare (1954–1957), was head of the Department of Psychopedagogy, and director of Integral Planning of Education in the Ministry of Education (1957–1969). Worked also as a forensic psychologist *Ad-Honorem* in the Forensic

Medicine of the Province of Panama, (1969–1989) and the general director of the Psychopedagogical Institute (1974–1984);

He was founder and first director of the Department of Psychology at Santa María La Antigua University (1965–1969) and was full professor in the degree of psychology at the University of Panama (1957–1999). He also was the first director of Research and Psychological Orientation at the University of Panama (1972–1983) and member of the National Education Commission (1980–1984). He organized the XIII International Congress of the Interamerican Society of Psychology that was in Panama City (1971). He was the founder and president of the Istmeña Society of Psychology in 1956, of the Psychopedagogical Institute in 1974, of the Panamanian Association of Psychology in 1975, of the Institute of Superior Nervous Activity in 1982, and was a regional representative of Mexico, Central America, and the Caribbean of the Interamerican Society of Psychology between 1955 and 1980.

It belonged to international scientific entities such as the International College of Psychosomatic Medicine, International Association of French Cybernetics (Association Internationale de Cybernétique Française), International Association of Applied Psychology, Caribbean Medical Association (AMECA), and Interamerican Psychological Association too. In addition, he was an honorary member of the Panamanian Academy of Psychology and the Panamanian Association of Therapeutic Hypnosis, at the same time he was a member of the International Association of Applied Psychology, he stood out as Commissioner of Scientific Research of the Coalition for “Drug-free Panama” and of the editorial committee of the Latin American Journal of Psychology.

He was appointed father of Panamanian psychology in 2018, for his extensive work in the systematization of the bases of the training of psychologists. He participated in the creation of the ladder and professional suitability of the Panamanian psychologist.

In 1954, he pioneered the application of psychological tests for psychodiagnostics in Panama with instruments such as the Rorschach and Brainard Occupational Preference Inventory

(BOPI) of Brainard, PP, & Brainard, RT (1956) at the Justo Arosemena Vocational School, as well as used the PMK Myokinetic Psychodiagnostic test, by Emilio Mira y López in cases of forensic psychology since 1969. He also pioneered in professional guidance and the clinical application of hypnosis in Panamá.

Malgrat Garcia presented his conferences at national and international conferences with his theoretical, clinical, and forensic contributions.

He received several awards among which the recognition for his contributions in psychology in 1975 by the Salvadoran Society of Psychology, diploma of merit for 25 years of contribution to the development and strengthening of psychology in 1982 by the University of Panama, the recognition “Panama If You Have Values” in 1982 by the Ministry of Education and Presidency of Panama, and for its valuable contribution to the development and projection of therapeutic hypnosis in Latin America, in 2003, of the Caribbean and Panamanian Associations of Therapeutic Hypnosis.

Manço, Luiz Celso

Born *in Ribeirão Preto (Brazil) on December 23, 1943*

Died *in Santos (Brazil) on June 20, 2020*

Juberto Antonio Massud Souza
State University of Rio de Janeiro (UERJ), Rio de Janeiro, Brazil

Keywords

Brazil · Armed struggle · Founder of Graduate course

Luiz Celso Manço was a psychologist who graduated from the University of São Paulo (USP) in Ribeirão Preto in 1970. His communist activism, before entering the psychology course, continued during his training, and until the end of his life. The context of the business-military dictatorship in Brazil (1964–1985) had consequences that haunted him throughout his personal and professional trajectory.

He belonged to the cadres of the Brazilian Communist Party (PCB). His first arrest was in

1967 when he was vice president of the *União Estadual dos Estudantes* (State Student Union). He participated in the VI Congress of the PCB, in which the so-called Marighella's wing split the party unity and took the initial steps toward the armed struggle in 1967. He adopted the code name Sebastião and was the one who read Ribeirão Preto's position, taking a position in favor of entering the armed struggle in the respective congress (Manço, L. C., personal communication, November 12, 2019). The split took shape and the *Ação Libertadora Nacional* (National Liberating Action) (ALN) was founded. Already integrated into the ALN, he was invited by the Brazilian revolutionary Carlos Marighella (1911–1969) to train guerrillas in two countries that had recently become independent, Cuba with the main objective of ideological improvement, and Algeria, for tactical and armed strategy actions (Manço, 2013; Manço, L. C., personal communication, November 12, 2019). He declined the invitation and took over the task in the *urban front* of the guerrilla group, remaining “legal on the student fronts, showing the face as far as he could and doing clandestine activities” (Manço, 2013).

He maintained close contacts with another Brazilian revolutionary, Joaquim Câmara Ferreira (1913–1970), the planner and responsible for the kidnapping of the US ambassador Charles Elbrick (1908–1983) in 1969. Marighella and Câmara Ferreira, the group's main leaders, were eliminated by Brazilian state terrorism in 1969 and 1970, respectively. Meanwhile, Luiz Celso Manço remained in Brazil, inserted between legality and clandestinity, while finishing his psychology course. So well done was the disguise in hiding that when the Military Justice requested information, the director of the Faculty signed a document saying: “We declare, upon request, that no occurrence is registered, [...] except for those relating to your performance as a student during the period from 1965 to the present date, as a student in the Psychology course of this Faculty” (Faculdade de Filosofia, Ciências e Letras de Ribeirão Preto, 1970). He was arrested again in 1969, with charges based on the *Lei de Segurança Nacional* (National Security Act), accused of

terrorism. The procedural indictment, which culminated in the *ALN case of 43*, in the *Supremo Tribunal Militar* (Supreme Military Court) (STM), collectivized the organization's responsibility, stating that its members: "resolved to join the organization led by Mariguella, which in late 1967 broke with the PCB, constituting a dissident wing, starting to use violent methods, to achieve Marxist ideals in Latin America [...] the denounced had been, since 1966, acting in the city of Ribeirão Preto" (sic), and characterized it as a "terrorist organization whose purpose was the takeover of power, through armed struggle, and the consequent change in the current political regime" (Military Justice, 1971). The book seized by the French psychologist Georges Politzer (1903–1942) was included in the evidence. He was tortured in a typical Brazilian type of torture called *pau-de-arara* (parrot's perch) by members of the *Esquadrão da Morte* (Death Squad). He did not report anyone. He remained in the central jail of Ribeirão Preto. He was released. He graduated from psychology, while his case remained pending judgment. After the arrest, part of the ALN of Ribeirão Preto was reincorporated to the party cadres of the PCB. He moved from Ribeirão Preto to the city of Santos where he worked at *Companhia Siderúrgica Paulista* (Steel Company from São Paulo) (COSIPA) as an industrial psychologist, while USP had not issued his diploma because of his criminal record. In 1971, he was denounced for his past activities by his chief psychologist. He was called into the office of the head of Human Resources, where he said: "You are fired [...] for reasons of "national security"" (Manço, 2019, p. 87). In 1971, he began teaching psychology-related subjects in various courses. He was called to organize the creation of the first psychology course in the region, inaugurated in 1972. But "as a psychologist, I could only start working at that time, because there was no certificate of good conduct" (Manço, 2013). In 1972, he was tried at the Supreme Military Court in Brasília and was cleared of the charges, which did not mean that he was not continued to be monitored by the repression. The files of the *Serviço Nacional de Informações* (National Information Service) (SNI) show that his information

and political activities were collected by agents of repression for decades, even after the end of the military dictatorship. In 1972, he was one of the founders of the psychology course at the *Universidade Católica de Santos* (Catholic University of Santos) (UniSantos), the first psychology course in the city, and was Coordinator of the University's Department of Psychology. He was also one of the founders of the *Sociedade de Psicologia da Baixada Santista* (Psychology Society of Baixada Santista) (SPBS) in 1977, in which he was one of those responsible for drawing up, in the previous year, for its provisional statute, which was "similar to that of the Psychology Society of Ribeirão Preto" (Manço, 2013), where he came from. It was the first psychology entity in the region, and he chaired its first board of directors. Later, it was transformed into the *Associação dos Psicólogos de Santos* (Santos Psychologists Association). Again, the figure of the whistleblower within psychology was present. The founding minutes were in the files of the *Departamento de Ordem Política e Social* (Department of Political and Social Order) (DOPS), along with the details of his criminal record. DOPS files link it directly to "Maringhela's Wing" (sic) and state: "The formation of the Psychology Society of Baixada Santista is being considered. The preparatory work is under the responsibility of the Organizing Committee made up of Luiz Celso Manço" (Departamento de Ordem Política e Social – Santos, 1977). For years, he continued to receive frequent visits from the police to his home in Santos as a form of intimidation. In another job, he worked as an industrial psychologist at Petrobras.

The documents of the *Divisão de Segurança Interna* (Internal Security Division) (DIVIN) of the state-owned company, in their confidential process, stated: "It is not advisable for the person named to remain as an employee of PETROBRAS [Brazilian Oil S.A.]. [...] he was linked to the group of [Carlos] Mariguella" (sic) (Petrobrás – Divisão de Segurança Interna, 1978). The psychologist was accused of using psychological tests "choosing some subjects to be part of his [criminal, terrorist] scheme" (Security and

Information Advisory, 1978). He was fired. He was a counselor in two terms of the Regional Council of Psychology (Conselho Regional de Psicologia) (CRP) and was the first one between 1980 and 1982. From 1982 to 1985, he was a member of the *Conselho Federal de Psicologia* (Federal Council of Psychology) (CFP). Still, he “militated in the anti-asylum movement that resulted in the intervention of Hospital Anchieta, in 1989, in Santos” (Conselho Regional de Psicologia de São Paulo, 2020, para. 5).

With the spread of Brazilian State terrorism after its dictatorial form, perpetuating itself in the democratic form, with the maintenance of investigative bodies, he continued to be investigated by repressive state apparatuses during democracy and after the 1988 Brazilian Constitution, appearing as security data until the decade of 1990. In 1987, the SNI reported that he was involved in organizing the Soviet delegation that visited the Santos and commemorated 70 years of the Russian Revolution (Serviço Nacional de Informações) (National Information Service, 1987). In 1988, the visit of Nicolai Boroda was registered, Soviet consul, “in the newspaper A TRIBUNA [The Tribune], together with LUIZ CELSO MANÇO” (Serviço Nacional de Informações, 1988) in Santos. In the same year, his activities were reported at the *União Cultural Brasil – USSR* [Brazil – USSR Cultural Union] in Santos. In 1989, his political activity within the PCB election plate was reported. In 1993, he appeared in the repression archives with his participation in the PCB congress, where he became part of the party’s Central Committee (Secretaria de Inteligência da Aeronáutica, 1993). In 1996, he included his participation in the XI Congress of the PCB.

Luiz Celso Manço was a particular case in Brazilian psychology. He entered communist studies in psychology, went into an armed struggle during the dictatorship, and faced the consequences of his political position within a reactionary society and profession. Pursued, imprisoned, denounced by fellow psychologists, and tortured, he did not bend. He incorporated the principles of his intense militancy into his practical-professional activity in the postprison

period. Within the development of his activity as a psychologist, he aimed to develop what he called a “more popular Psychology,” “a Psychology that freed itself from elitization or a Psychology of the worker.” To this end, in his classes, he used theoretical references from Soviet psychology by authors such as Vigotski (1896–1934), Leontiev (1903–1979), Rubinstein (1889–1960), Boris Pariguin (1930–2012), and others such as Maurice de Montmollin (1926–2013), Basaglia (1924–1980), among others. When asked a few months before his death and with a respirator that blew air into his lungs if he regretted his political options, including armed struggle, he replied: “No! It was worth it” (Manço, L. C., personal communication, November 12, 2019). More than a theoretical legacy, he was a man of action. He died as communist in a counterrevolutionary time, as his party, which was affiliated for more than five decades, said at the time of his death: “whoever tells the story of Santos’s fighters had an obligation to talk about Luiz Celso Manço, or he will be lying!” (Partido Comunista Brasileiro, 2020, para. 5).

The formation of Robert Auguste Edmond Mange – Roberto Mange (Zanatta, 1991; Antunes,

2001; Zanetti & Vargas, 2007; Araújo, 2013) – implies coming and going between Brazil and Europe (Castro, 2014). He had a primary education from 1895 to 1898 in the Canton of Neuchâtel, then studied in Germany in 1900, learned Portuguese in Lisbon as a boy (his father was appointed commercial representative of a Swiss watch factory in Portugal in 1902), graduated in mechanical engineering at the Eidgenössische Technische Hochschule de Zürich (better known as Polytechnikum) in 1913 (*undergraduate degree*), worked as an engineer in the Swiss branch of a Belgian company and came to Brazil still in the year he graduated, returned to Switzerland in 1914 (to report to the Army because of World War I), and returned to São Paulo in 1915. He participated in studies on mental hygiene and hygiene applied to work (carried out in the Paulista Section of Mental Hygiene) with Lourenço Filho and traveled back to Europe in 1923 to update himself on psychotechnics. He then began the activities of the Professional School of Mechanics at the Liceu de Artes e Ofício de São Paulo (School of Arts and Crafts of São Paulo), in 1924. Mange returned to Germany in 1929 to study the methods of learning at work on the railroads and organized in 1930 the Professional Education and Selection body of the Sorocabana Railway. In 1939 (in the context of World War II), he received the title of Brazilian citizen. In 1947, he was appointed president of the Psychology Society of São Paulo and traveled again to Europe to study professional education.

In 1913, the same year he graduated in engineering, Mange, together with Félix Hegg, both colleagues and former students of the same course, joined the teaching workforce of the Escola Politécnica de São Paulo (Polytechnic School), an engineering school founded in 1893, at the invitation of Antônio Francisco de Paula Souza (1843–1917), then director and also a former student of the school in Zurich. From 1915, Mange intensified his activities at the Polytechnic School, and his work would gain notoriety with the organization of the mechanic's course at the School of Arts and Crafts of São Paulo, a basic training school for apprentice

workers, created in 1873. His activity was innovative, based on the principles of scientific administration, since Brazil was beginning to industrialize.

In fact, the economic growth of São Paulo itself, until today the most developed state in Brazil, has given rise to various opportunities for Mange. The Sorocabana Railroad, which was an important means of transportation for coffee production and was under the control of the São Paulo state government since 1919, identified the need to train qualified mechanics for its workshops, where the trains themselves were maintained. Thus, The Sorocabana Railroad, from 1924, started to send students annually to the Mechanical School, directed by Mange, attached to the School of Arts and Crafts.

Mange's performance at the head of the Mechanical School earned him an invitation to expand his activities, and he became responsible for the creation of the Professional Teaching and Selection Service of the Railroad Company (Estrada de Ferro de Sorocabana). Over time, this initiative has led to the growth of small technical schools on different railroads and, later, to a broader project to create "Centros Ferroviários de Ensino e Seleção Profissional" (Educational and Professional Selection Railroad Centers – CFESP), which basically began to function as technical schools maintained by railroad companies in the state of São Paulo, including private ones, with government subsidy (Salvadori, 2006).

Years later, in a broader context, Mange also became one of the main figures in the creation of other institutions linked to the development of human factors at work. In fact, in 1931, together with Lourenço Filho and others, he organized the Instituto de Organização Racional do Trabalho (Institute for Rational Work Organization – IDORT), initially conceived as a psychotechnical society (Vizeu, 2018). This institute represented a strong influence in the context of Brazilian industrial development (Antonacci, 2011) because at that time, main initiatives regarding professional qualification were sometimes developed in São Paulo (Castro

and Ghiringhelo, 2011), Brazil's main industrial center. But it is important to remember that sometimes these initiatives took place in Rio de Janeiro (Castro and Alcântara, 2011), then the capital of the Republic, through the Instituto de Seleção e Orientação Profissional (Institute of Selection and Professional Guidance – ISOP), an institute also focused on the development of applied work psychology.

In the late 1930s and early 1940s, together with industrialists such as Roberto Simonsen (1889–1948) and Euvaldo Lodi (1896–1956), Mange participated in the organization of the Serviço Nacional de Aprendizagem Industrial (National Industrial Learning Service – SENAI), becoming the first director of the regional department of São Paulo, a position he held until his death.

The important aspect to be considered is that Roberto Mange, a Swiss engineer and professor naturalized Brazilian, was one of the main promoters of applied psychology and psychotechnics in industrial work in Brazil. In addition, he is considered the precursor of the application of psychological tests for the selection of personnel in Brazil, because he used professional aptitude tests developed by Fritz Giese (1890–1935) – one of the pioneers of applied psychology in Germany – in 1925, when he made the selection of candidates for the Practical Mechanics Course of the School of Arts and Crafts (Antunes, 2001; Castro, 2014).

Colombia · Lithuania · Psychology of religiosity · Motivation

Matas Vytautas Mankeliūnas Staniulionis was born in Lithuania in 1912, when it was under the rule of the Russian Empire. Lithuania was an agricultural country with strong cultural features, such as a dominant Catholicism, and was striving to maintain its national identity (Eidintas et al., 2013). Mankeliūnas was the eldest of four brothers. His father worked in a post office until the beginning of World War I (1914–1918), when the family migrated to a small town in Russia (Alejo, 1993). In 1915, the German army, Russia's enemy in the war, took Lithuania. This favored the emergence of an independence movement that was consolidated in 1918, when Lithuania regained its recognition as a European state. After this date, the Mankeliūnas Staniulionis family returned to Lithuania to live on a small farm, as 84% of the population then did (Eidintas et al., 2013). There, the father homeschooled his children until he died in an accident in 1924 (Alejo, 1993).

Those six postwar years represented remarkable progress for Lithuania in all areas, including education (Eidintas et al., 2013). In 1924, Mankeliūnas entered the newly founded Alytaus valstybinė gimnazija (Alytus State Gymnasium) to study from the second year of high school. At the gymnasium, he approached the Catholic chaplain, who influenced him to devote himself to religious life (Alejo, 1993). After completing his baccalaureate in 1932, he entered the Kauno kunigų seminarija (Kaunas Priest Seminary) in

the Diocese of Kaišiadorys. He enrolled to study Catholic theology at the Lietuvos universitetas (University of Lithuania) in the same city (today the Vytauto Didžiojo Universitetas (Vytautas Magnus University)). He received his priestly ordination in 1936 and remained at the seminary as a professor and a prefect (Kiškis, 1996).

In that same year, 1936, he met the priest and psychologist Jonas Steponavičius, who had studied with Wilhelm Wundt. This sparked his interest in psychology, and he began his study in 1937 at the Katholieke Universiteit Leuven (Catholic University of Leuven), Belgium. There, he studied with Albert Michotte, who had studied in Leipzig with Külpe and worked on the experimental phenomenology applied to the perception of causality (Leysen, 2015). He also studied human motivation with Joseph Nuttin (e.g., Nuttin, 1961). The most notable intellectual influence was that of Wundt, Brentano, and Ebbinghaus, with a strong emphasis on basic psychological processes (Alejo, 1993). While studying psychology, he graduated as a Doctor of Theology on October 29, 1938, amid a controversy over the originality of his work (Liuima, 1997). The next year, 1939, he graduated as a psychologist. Before returning to Lithuania in 1940, he followed a course at the Pontificia Università Gregoriana (Pontifical Gregorian University) in Rome, Italy, on university teaching and pedagogy.

World War II (1939–1945) started when Lithuania was amid a political tension. Initially, it was pressured by Germany to cede part of its territory and was finally occupied by the USSR in 1940 (Eidintas et al., 2013). Kaunas, the provisional capital of the independent Lithuania and one of the cities the Russians occupied first, was the place where Mankeliūnas lived in the priest seminary. At the same time, he worked as an associate professor at the University of Lithuania, where he taught psychology (Alejo, 1993).

Since the occupation and for one year, there was a violent process of Sovietization that included the closure of organizations, the silencing of leaders, the imposition of the foreign Soviet culture, expropriations, assassinations, and mass deportations to Siberia, amid panic and widespread silence, including that of the Church

(Rimgaila, 2015). In 1941, the Soviet-German conflict broke out and led to the German occupation of Lithuania for three more years and the continuation of the same violence under another oppressor. In 1944, as German retreat was imminent along with the return of the Soviet Army, many Lithuanians decided to flee to Germany. Mankeliūnas was among them, and he emigrated in 1945 with four other priests, leaving the Diocese of Kaišiadorys with the permission of the bishop, who considered them in great danger (Kiškis, 1996).

In Germany, as in other countries, Lithuanians grouped together in communities preserving their religious traditions (Blažytė, 2008). Between 1945 and 1946, Mankeliūnas was part of a committee that organized donations from Switzerland for displaced Lithuanians. He saw himself involved in a controversy over the management of these resources, and it seems this influenced his decision to migrate to Colombia (Liuima, 1997). In the midst of that, he took a course on existentialist phenomenology with Karl Jaspers at the Ruprecht-Karls-Universität Heidelberg (Ruprecht Karl University of Heidelberg), Germany, between 1947 and 1948. Upon completion, he received an invitation from a Lithuanian priest residing in Colombia, Father Saldukas, who, along with the honorary consul, Stasys Sirutis, had organized the immigration of a group of Lithuanians (B. Rimgaila, Lithuanian immigrant, personal communication, February 28, 2020). Thus, on September 11, 1948, Mankeliūnas sailed from Bordeaux, France, to Cartagena, Colombia, to settle permanently in Bogotá.

In Bogotá, he worked in a parish from his arrival until 1952. After a one-year course and having homologated his studies, he graduated from the Pontificia Universidad Javeriana (Pontifical Javeriana University) with a doctorate in philosophy. His thesis was on philosophy of nature and the natural sciences according to the Aristotelian-Thomist doctrine, which became his first publication (Mankeliūnas, 1954). In the same year, 1952, he joined his *alma mater*, Javeriana University, teaching a course on psychology of religion.

In 1953, he joined the Instituto de Psicología Aplicada (Institute of Applied Psychology) of the

Universidad Nacional de Colombia (National University of Colombia) through another Lithuanian psychologist, Albinas Liaugminas. Both represented a new professor profile, with purely psychological training, since psychiatrists and philosophers predominated at the time at the Institute of Psychology. Between 1953 and 1954, Mankeliūnas taught psychology and religion. In 1955, he joined the same institute as a part-time professor and held this position until 1960. During this time, he taught new subjects, such as the history of psychology, experimental psychology, comparative psychology, philosophy and psychology of education, psychology of religious life, philosophical anthropology, and methodology of scientific research (Facultad de Psicología, 1960; Universidad Nacional de Colombia, 1958). His publications at this time and until 1961 were oriented toward specific aspects of the relationship between psychology and religiosity, a subject on which he published a book (Mankeliūnas, 1961). In these first writings, he wrote as a theologian analyzing psychological aspects of the subject. For example, Mankeliūnas (1956) reflects on the compatibility of psychoanalysis and Christianity. There, he wrote as the pastor who sanctions to what extent the believer can accept or not the Freudian theses.

In this first period of institutional enrollment in the National University of Colombia, it is highlighted that he was the first editor of the *Revista de Psicología (Journal of Psychology)*, founded in 1956 by the then director of the Institute of Psychology, Luis Jaime Sánchez. Mankeliūnas was its editor for 20 years (1956–1976). It was the only psychology journal edited in Colombia until 1969, even though its scope was local and institutional (Domínguez and Duque, 1999). During his editorship, the journal was published without interruption and with a clear editorial policy oriented to the dissemination of studies and reflections on psychology as a science and a profession.

Also, around this time, in the mid-1950s, Mankeliūnas was appointed chaplain to the Lithuanian community in Bogotá, a job he dutifully assumed for the rest of his life, despite distracting him from his academic interests. His

characteristics of being sparing with words and reserved, his philosophy-laden sermons, his reluctance to recognize female leadership in some cases, and changes in the cohesion of the community led to his pastoral role being reduced to liturgical celebrations only on commemorative dates, without undermining the appreciation and respect that the Lithuanian community always felt for him (B. Rimgaila, personal communication, February 28, 2020). In addition to that link, he continued looking for financial contributions to the Lithuanian Foundation, a Chicago-based nonprofit association for the promotion of Lithuanian education and culture (Dirva, 1981).

After 1960, he was appointed a full-time professor at the Faculty of Psychology of the National University of Colombia. On his initiative, the first experimental psychology laboratory in the country was founded in 1963, modeled on German experimental psychology, being Mankeliūnas himself in charge of importing the instruments (Ardila, 2019). In 1964, he received his naturalization as a Colombian. In the mid-1960s, his publications had a more systematizing purpose. In these texts, he wrote not as a theologian, but as a psychology theorist who tried to integrate the various approaches to a field. An example of this is the special issue of the *Journal of Psychology* on motivation, which was the seed of a compilation that 23 years later would be published and widely disseminated in Spanish (Mankeliūnas, 1991).

Mankeliūnas was in charge of the faculty deanship in 1965 and from 1968 to 1970 was director of the Department of Psychology. A few months before assuming the position of director, he was commissioned for three months to travel to Germany and learn about the curricular organization and operation of the laboratories in the psychology faculties. He visited the universities of Munich, Giessen, Göttingen, Bonn, Cologne, and Frankfurt (Alejo, 1993). On that same trip, he went to Rome carrying out some responsibilities assigned to him at the International Eucharistic Congress, held in Bogotá, as responsible for South American affairs (Draugas, 1968). After his commission, he came up with renewed ideas and led the renewal of the psychology study program,

which was finally approved in 1969 and would be valid for 20 years. His production in the late 1960s concentrated in reports and reflections on the formation of psychologists, which was congruent with his institutional position at that moment (e.g., Mankeliūnas, 1967).

In the 1970s, Mankeliūnas served as a scientific advisor to the Instituto Colombiano para el Fomento de la Educación Superior (ICFES) (Colombian Institute for the Promotion of Higher Education) for the approval of new psychology programs. At that time, he was part of the board of directors of the Federación Colombiana de Psicología (Colombian Federation of Psychology), which first proposed a deontological code for psychologists. In 1976, the same federation awarded him the National Prize for Psychology, the highest local recognition for his professional career in the discipline. In 1978, he submitted his resignation to the National University of Colombia and retired. Three months later, he was appointed director of the Oficina de Admisiones e Información Profesional (Admissions and Professional Information Office) at the same university, a position from which he coordinated the application of the admission examination until 1982, when he presented his definitive resignation from the university.

Mankeliūnas's academic production in the 1970s reflects his maturity in studying the epistemology of psychology. There are no longer vestiges of his religious position, but we mostly see an author concerned with the theoretical and methodological foundation of psychology as a science and as a profession. His methodological rigor was recognized among his colleagues and students, who used to call him "Father Mateo." From thinking of psychology as a science of consciousness in the 1950s, he now regarded it as a science of behavior (Mankeliūnas, 1976a). He also showed interest in the psychological study of thinking, but he did it with a systematizing purpose (cf. Mankeliūnas, 1976b).

In the last years of his life, Mankeliūnas reaped several fruits from his work. In 1983, he was the first dean of the newly opened Faculty of Psychology at the Instituto Universitario de Ciencia y Tecnología Konrad Lorenz (Konrad Lorenz

University Institute of Science and Technology), an experimentally oriented psychology training program. In 1986, he coordinated an ethics project requested by the Consejo Profesional de Psicología (Professional Council of Psychology). In 1989, he published his last epistemological reflection, which proposed the general systems theory as a model for the study of humans (Mankeliūnas, 1989). On September 9, 1992, he was appointed honorary professor at the National University of Colombia in celebration of the 125th anniversary of the institution. He died in the early morning hours of December 20, 1993, due to a heart problem, surrounded by his friends from the Lithuanian community.

Wilhelm Mann Olderman was born in Bielefeld, Germany, in 1874. He married with Blanca Fischer Klein, a Chilean of German origin. He received his doctorate in philosophy from the University of Frankfurt, Germany, and arrived in Chile as part of a plan to improve education, initiated by President José Manuel Balmaceda, with the creation in 1889 (Fernandois, 2011) of the Instituto Pedagógico (Pedagogic Institute).

Mann arrived in Chile in 1904, after the death of Georg Heinrich Schneider (1846–1904), who was his predecessor at the Instituto Pedagógico de la Universidad de Chile (University of Chile) (Salas, 2012), with the purpose of directing the Chair of Pedagogy, Psychology and Logic. In December of the same year, Rodolfo Lenz transferred to Mann the rectorship of the Lyceum of Application (Salas, 2012). As rector, Mann inaugurated the Experimental Psychology course and

promoted the importance of women's education, with the creation of the first Liceo Femenino del Estado (Women's State Lyceum) (Fernandois, 2011), also called the Liceo Superior de Niñas (Lyceum for Girls); he inaugurated Special Education for mentally weak children and organized the first Chilean Experimental School (Somerville et al., 1942).

As a professor on Psychology and Pedagogy, he was responsible for initiating his pupils and students in the methods of accurate research of mental phenomena (Somerville et al., 1942). To this end, during the years 1906 and 1907, he made trips to different European countries with the objective of managing the acquisition of apparatus to install a laboratory at the University of Chile. In 1908, under his direction, the first Experimental Psychology Laboratory was established in Santiago de Chile and the second in the country, after the one created by Rómulo Peña (1866–1938) (Salas & Lizama, 2009). Both Peña's and Mann's laboratories were influenced by Wilhelm Wundt himself, who collaborated in the very choice of the apparatus (Salas & Lizama, 2009). Later, and since 1923, it would be transformed into a cabinet mainly oriented towards the measurement of intelligence, by adapting the Binet-Simon Scale to Chilean reality (Salas et al., 2018). This laboratory gave birth to the future Instituto de Psicología de la Universidad de Chile (Institute of Psychology of the University of Chile) in 1942 (Fernandois, 2011).

For Mann, the founding of the laboratory had two purposes. The first was related to the intuitive and active teaching of the study of modern psychology and also to teach future pedagogues how to guide the teaching processes in relation to the individual characteristics of the students. The second one was related to the development of scientific research of its own, which dealt with the value of productive forms of work for learning (Mann, 1909; Salas, 2012; Somerville et al., 1942). These were the first outlines of a proposal whereby learning was understood as an action of the students themselves.

Related to Psychology in Chile, Mann generated important contributions that allowed its development. One of his most important

publications was related to psychopathology and mental anomalies, constituting a general taxonomy on mental deficiencies in the educational context and their treatment (Mann, 1912b; Salas, 2012). In 1912 the National Congress of High School Education was held, showing the important role that psychology had acquired in the field of education. Mann sets out an educational program in which "psychology would have a central role in providing the student with the means to recognize his style of mental work and to direct his personality and his self-educational processes" (Mann, 1912a, pp. 26–27). In this sense, the role of school psychology would allow to identify in the learner those factors involved in his development and behavior, offering an opportunity to improve his natural aptitudes. The incorporation of the psychology sections in the high school curriculum, and their special relevance in the development of mental processes, was therefore established (Salas et al., 2018).

In relation to this, the first links between psychology and pedagogy were established, which were strengthened by the incorporation of pedagogical tasks within the laboratory, such as the study of the student (Mann, 1911), and the need for the pedagogue, as a teacher, to submit to scientific self-control, establishing the scientific bases of pedagogy (Somerville et al., 1942). He also proposed the implementation of a school psychology office in teacher training colleges, similar to the Psychology Laboratory established in 1908 (Salas & Lizama, 2009).

In his text *The teaching of psychology and logic in the lycée*, he expresses the practical value of psychology, which provides the student with the necessary tools for self-direction and self-education of his own personality (Mann, 1915). So, psychological teaching emphasized mainly the treatment of functions like memory, representations, imagination, attention, logical functions, feelings, and the will (Salas et al., 2018).

Among the contributions that Mann made to the educational field, he notably specified the concepts and methods proper to education and proposed philosophy and ethics programs for high schools (Salas, 2012). In this way, Mann became one of the pioneers in the field of Chilean

educational psychology and, together with Peña, was responsible for introducing an experimental Wundtian-style psychology. His name, therefore, has remained linked to the foundations of modern academia in the areas of education, psychology, and humanities in Chile.

Gerardo Mansur developed an extensive career as a university professor and psychoanalyst in Córdoba. An active defender of the psychology profession and the democratic environment at the university, he also participated in the establishment of professional associations and societies related to Lacanism in Córdoba.

He studied psychology at the Psychology Program at the Facultad de Filosofía y Humanidades (Faculty of Philosophy and Humanities) of the Universidad Católica de Córdoba (Catholic University of Córdoba, UCC). In 1969 he graduated as psychologist and professor of psychology.

During his studies he experienced intense debate times at the UCC, a Jesuit university, due to the reforms that were being introduced after the Second Vatican Council and the increased politicization of the student movement (Morello, 2008; Ferreyra, Guzmán, Quiroga, Scherman, & Zúñiga, 2020). There he met Teresita Perla

Martínez (1944–2021), also a psychoanalyst, whom he married in February 1971; witnesses to the wedding were their professor Teodoro Elías Isaac (1932–2022) and their colleague Miguel Ángel Mirotti (1935–2020).

From his early beginnings his teaching activity was directed toward the psychologists' professional training, first at the Catholic University of Córdoba, and soon at the Universidad Nacional de Córdoba (National University of Córdoba, UNC). He continued later training psychoanalysts at the Ateneo Psicoanalítico de Córdoba (1978–1992) and at the Colegio Freudiano (1992–2001), both institutions he helped to found.

At the UCC he began his teaching work as a student assistant in several required courses such as Cultural Anthropology, Social Psychology, and Psychology II. In 1969 he joined the staff as a professor in charge of Psychology II and History of Psychology, a position he held until 1975, when the Psychology Program was closed for political reasons (Padvalskis & Petit, 2012). In addition to these courses, in 1974 he also taught the Seminar on Psychoanalytic Clinic and the Seminar on History of Psychology and Psychopedagogy in the Pedagogy Program at the UCC. On the other hand, in 1970, the Facultad de Ciencias Económicas y de Administración (Faculty of Economics and Administration) hired him to teach Methodology Learning, and the Theology Theory and Criticism Seminars.

His significant institutional involvement together with his concern in the development of the Psychology Program placed him for a brief period as director of the Psychology Program at the UCC, between the end of 1972 and the beginning of 1973.

As a professor at the National University of Córdoba, in the Psychology Program, he devoted himself to the History of Psychology issues from 1970–1975, where he introduced epistemological concerns and novel readings, such as the work of Georges Politzer (1903–1942), to the first-year students, enthusiastically received in a context of political and cultural effervescence in Argentina. He was dismissed from his position in 1976 by the government of the military dictatorship (1976–1983) and reinstated in 1984 to his teaching

duties together with the group of professors who had been dismissed. He continued teaching the same course until 1997, although in 1986 it changed its name to Schools, Trends, and Systems of Contemporary Psychology due to the change in the syllabus of the Psychology Program. In 1987, already strongly influenced by his knowledge of Lacan's work, following a process of selection by competitive exam and background submission he was appointed professor of the General Psychopathology course, a position he held until his death. In 1999 he added the teaching of Psychopathology II.

In addition to his teaching duties, and within the framework of a transformation process at the university system in Argentina that emphasized research tasks, in 1996 he began to direct research projects at the UNC. The first of them focused on the study of psychopathological theories applied to the treatment of psychosis in clinical hospital practice, held in public institutions in the city of Córdoba. He reached the second high level in the Argentine Ministry of Education research professorship program. In the last period of his life, he resumed his old interest and joined the research project in history of psychology, to study the precedents of professional psychology in Córdoba.

His participation in the political arena at the National University of Córdoba was also very relevant. Prior to the outbreak of the military dictatorship, he was appointed for a brief period of five months academic secretary of the Facultad de Filosofía y Humanidades (Faculty of Philosophy and Humanities) at the UNC in 1973, position he resigned to become director of the Psychology Department of that Faculty until December 1974.

After the restoration of the democratic system in Argentina, he collaborated decisively with the reconstruction of the University's democratic governance. Thus, through a rectoral resolution he was appointed to join the Mixed Commission for the Reinstatement of Professors – in representation of the dismissed professors. Immediately, from 1984–1986 he served as Decano Normalizador (Regularizing Dean) of the Faculty of Philosophy and Humanities of the UNC. In the 1990s he continued his participation in the Governing Organizations of the UNC. From 1992–1994, he was a member of the Consejo Asesor (Advisory Council)

of the Departamento de Psicología (Psychology Department), on behalf of the Professor's Staff. From 2002–2006, once the Facultad de Psicología (Faculty of Psychology) was established, he was elected member of the Honorable Consejo Directivo (Directive Council) of the Faculty. Finally, he was a member of the Honorable Consejo Superior (Superior Council), the highest governing organism of the UNC, representing his fellow Psychology Faculty peers.

In 1978 he participated in the foundation of the Ateneo Psicoanalítico de Córdoba (Psychoanalytic Athenaeum of Córdoba), an institution that later became Escuela de la Orientación Lacaniana (EOL) (Lacanian Oriented School) (Novotny, 2020). In the Psychoanalytic Athenaeum of Córdoba, in addition to founding member and member of the Steering Committee, he was director of the *Revista del Ateneo Psicoanalítico de Córdoba* (Psychoanalytic Athenaeum of Córdoba Journal) since 1981. In the 1990s he founded the Colegio Freudiano de Córdoba (Córdoba Freudian School), of which he was president and director of the Editorial Committee at the publication *Cuadernos* (Papers).

He is highly remembered for his activity in defense of the psychology profession. In August 1969, he participated in the Psychologists General Assembly of Córdoba and was nominated to be part of the first commission of the Asociación Pro Colegio de Psicólogos de Córdoba (Association Pro Psychologists Organization of Córdoba). In 1979, the Colegio de Psicólogos de la Provincia de Córdoba (Psychologists Association of the Province of Córdoba) was constituted based on the confluence of different personalities and scientific associations, such as the Psychoanalytic Athenaeum, after a process in which Mansur and his wife actively participated. In that time, in a strongly repressive context, which one of the most tragic events was the kidnapping and disappearance of Beatriz Perosio (1947–disappeared 1978) in Buenos Aires, the scientific and professional associations played a very valuable and cohesive role in that context (González Aguirre, 2012).

Then, in 1983 Gerardo Mansur, together with other colleagues, published a text that was crucial for the recognition of the autonomous practice of

the profession: *En defensa de la psicología. Un triple enfoque: científico, universitario y legal* (In defense of Psychology. A triple approach: scientific, University and Legal) (Mansur, Lobera & Calvo, 1983). The authors argued about the value of the profession in those three dimensions. The text was circulated throughout the country, and contributed to provide elements for the enactment of the laws that regulated the conditions for the psychology professional practice as well as rights, obligations, and prohibitions that were passed in the different provinces of the country and in the federal district of the city of Buenos Aires (National Law 23.277 passed in 1985). With this law, the professional activity was able to establish itself as autonomous and not considered as an auxiliary of physicians or psychiatrists (Klappenbach, 2000).

Pioneer in the reading of the Jacques Lacan (1901–1981) work (Ferrari, 2017; Mazza, n.d.), he was invited as a professor and lecturer at several universities in the country, such as Universidad Nacional de La Rioja (University of La Rioja), Universidad Nacional de Tucumán (National University of Tucumán), and Universidad del Aconcagua (University of Aconcagua, in Mendoza). He was also invited by the Universidad Mayor de San Simón and the Ateneo Psicoanalítico in Cochabamba city, Bolivia, in 1987.

At the UNC he taught numerous postgraduate courses among which stands out since 2000 the Postgraduate Program on Lacanian Clinic, from which it was generated a series of publications organized by Professor Mansur, Teresita Martínez de Mansur, and María Teresa Paz on “Lacanian Clinic,” “The analytic act,” and “The real in the Lacanian clinic” linked to be able to mathematize the clinical action.

Also, local health care institutions and professional societies permanently summoned Professor Mansur to lecture and professional updating. There he unfolded his epistemological concerns and crucial problems of analytical practice. At the Psychoanalytic Athenaeum of Córdoba he was part of the institution's permanent teaching staff, giving seminars and coordinating discussion groups on Lacan's work from 1978–1985, a task he continued later at the Córdoba Freudian School.

Professor Mansur left a deep mark in Córdoba. His book *In Defense of Psychology* was fundamental for the drafting of provincial professional laws, pioneers in the country, which represented a decisive contribution to the achievement of the full exercise of the profession. Recognized in the country as one of the major referents of the Lacanian orientation, he was a committed university professor, always encouraging his colleagues to follow their own paths. In everyday life, he introduced rhetoric and language games with which he called for witty dialogue in a humorous register that he maintained until his last days.

Hilda Marchiori studied at the Universidad Nacional de Córdoba (National University of Córdoba). In 1966, she obtained her degree in psychology and in 1971 her PhD, also in psychology. Between 1967 and 1969, she received a scientific initiation scholarship granted by the Consejo Nacional de Investigaciones Científicas y Técnicas (National Council of Scientific and Technical Research, CONICET), for the research of aspects related to the individualization of punishment. That research allowed her to write her doctoral thesis “Study of the circumstances related to the personality of the offender usable for the purpose of determining the penalty.” Her director was the outstanding master of Argentine Criminal Law, Dr. Ricardo C. Núñez (1908–1997).

From a very young age, her work sought to articulate research, professional practice in the penitentiary system, and training of young professionals. In 1965, she worked as Technical Professional at the Servicio Penitenciario de la Provincia de Córdoba (Penitentiary Service, Córdoba Province), and between 1969 and 1971, she taught a Seminar of Criminal Behavior in the Psychology Program, at the National University of Córdoba.

In 1972, she moved to Mexico and joined the Toluca Penitentiary Center. There she specialized in criminology, training with the outstanding penitentiaries and criminologists Dr. Alfonso Quiróz

Cuarón (1910–1978) and Lic. Antonio Sánchez Galindo (1933–2019) at the Instituto de Ciencias Penales (Mexican Institute of Penal Sciences). In 1975, she obtained a degree of Specialist in Criminology, from the Procuraduría de México (Mexican Attorney General’s Office). In that country, she continued to develop her interest in professional, teaching, and research activities. Between 1973 and 1978, she was professor of psychopathology at the Universidad Autónoma México (Autonomous University of Mexico), and professor of criminal psychology and criminal psychopathology at the Instituto Nacional de Ciencias Penales (National Institute of Criminal Sciences) of Mexico in 1979 and 1980. Between 1972 and 1981, she worked as criminologist of the Centro Penitenciario (Penitentiary Center) of the State of Toluca, Mexico, and also as criminologist for social readaptation, as well as in the coordination with crime prevention programs.

In 1983, with the return of the democratic system to Argentina, she returned to her native Córdoba, where she still lives today, and where she developed an intense activity. In 1984, she served as Advisor to the Servicio Penitenciario (Penitentiary Service) of the Córdoba Province, and in 1986 and 1987 she was appointed Vice-Director of the Penitentiary Service. In 1985, she founded in Córdoba the Centro de Asistencia a las Víctimas del Delito (Crime Victims Assistance Center), the first governmental center of its kind in Latin America, of which she was its director for more than ten years. In doing so, she decisively marked the importance of professional engagement in the public policies design of victim care (Lima-Malvido, 2015) and thus stood out as a pioneer in the area (Dussich, 2015).

As a researcher, her activity began at the Centro de Investigaciones Jurídicas y Sociales (Center for Legal and Social Research) of the National University of Córdoba. Upon her return to Argentina, victimology became her main area of interest (Rodríguez-Manzanera, 2005, 2010). From 1988 onward, she investigated the relationship between the perpetrator-victim of the crime, family victim, known victim, and unknown victim. She continued with the study of the victim, complaints, and criminality, an approach from

which she developed the Encuesta de Victimización (Victimization Survey) for the knowledge of criminality in reported and unreported crimes, based on a model of inquiry that was also being developed in other countries (Atehortua & Kury, 2006). These activities were developed until 2009 and were supported by the Consejo Nacional de Investigaciones Científicas y Técnicas (National Council for Scientific and Technical Research).

As a professor, she was prominent in undergraduate and graduate training, in Argentina as well as other Latin American countries. She was a professor of criminological psychology at the National University of Córdoba from 1988 to 2010. Throughout her career, she has been invited to teach at several Latin American universities (Marchiori, 2005).

The defense of human rights was also an area to which she dedicated her interest. Between 1999 and 2008, she was Director and Secretary of the Oficina de Derechos Humanos y Justicia (Office of Human Rights and Justice) of the Judiciary and Superior Court of Justice of Córdoba.

Currently, she continues with her academic activities, as a member of international scientific societies related to criminology and victimology. She was founder of the Asociación Argentina de Victimología (Argentine Association of Victimology) and is an honorary member of the World Society of Victimology, since 2009. During her outstanding career, she has received numerous national and international awards and distinctions, by the World Society of Victimology in 1991, by the Congreso de la Nación Argentina (Argentine Parliament) in 1993, by the B'nai B'rith award for Human Rights, Argentina, in 1998, and by the Sociedad Mexicana de Criminología (Mexican Society of Criminology), in 2005, among others. In 2015, she was awarded the highest distinction *Magister Humani Mundial* in Guanajuato, Mexico, for her contributions to criminology and victimology. Various universities and associations of Spain, Mexico, and Argentina have distinguished Dra. Marchiori for her concern about the understanding of the processes that lead to crime,

criminality, and victimization, as well as the serious individual, family, institutional, social, and cultural consequences.

From a very young age, she maintained an intense intellectual production. She has published numerous books and articles and has been a member of many editorial and advisory boards on journals in the area, including the *International Perspectives in Victimology* journal. She has directed the collection *Criminología* (Criminology) in Mexico, and codirected the *Colección de Derecho Penal y Criminología* (Criminal Law and Criminology Collection), by Editorial Lerner, a publishing house specialized in law and legal issues, in Córdoba, Argentina. From 1989 to 1999, she directed the journal *Victimología* (Victimology), first series. From 2004 to the present, she edited and directed the second series of the *Victimología* (Victimology) Journal. Dra. Marchiori's tireless work in the translation and publication of victimology papers in Spanish has also been noted (Pearson, 2009).

One of Dra. Marchiori's main contributions was to deal with the processes of victimization, emphasizing the credibility of the victimological account. She also considers that the legal-clinical and social intertwining leads to a deep respect and understanding of the crime victim, in which prevention is a fundamental axis in the construction of a caring society. These conceptions were embodied in the Centro de Asistencia a las Víctimas del Delito (Crime Victims Assistance Center), where the assistance with a criminological clinical approach involved a practice of individualization in each specific case, taking into account the characteristics of the victim, their family, their personal history, and the aggression experienced.

Durval Bellegarde Marcondes was the son of an employee of a law firm and a housewife from one of the aristocratic families in São Paulo. This meant that Marcondes had close ties to members of this elite, many of whom were in the high echelons of state government, and this influenced his professional career. Marcondes graduated from the *Faculdade de Medicina de São Paulo* (FMSP) [São Paulo School of Medicine] in 1924, specializing in clinical psychiatry. Soon after, he was hired as a psychiatrist for the School Hygiene and Health Education Inspectorship of the State Department of Education. He was also an assistant in Social Psychology (1934–1938) and professor of Psychoanalysis and Mental Hygiene (1940–1949) at the *Escola Livre de Sociologia e Política* [Free School for Sociology and Policy]. In 1938, the psychiatrist founded a Mental Hygiene Office in the State Department of Education, which he directed until his retirement in 1954. This office was responsible for child guidance clinics, psychology clinics, special classes for the “mentally weak” and also for a sector focusing on research, teaching, and dissemination of mental hygiene. Beginning in 1954, Marcondes taught Psychology at the *Faculdade de Filosofia da Universidade de São Paulo* (USP) [School of Philosophy at the University of São

Paulo], and the course was later transformed into a specialization in clinical psychology. After a law was enacted in 1962, regulating the profession of psychologists and the minimum training required, the course on clinical psychology was incorporated into the undergraduate degree in psychology at USP. Marcondes, in addition to teaching that course, was responsible for clinical psychology and for coordinating the clinical psychology group at USP until 1968 (Sagawa, 1989, 1994, 2007).

In addition to working in the areas of clinical psychology and mental hygiene in schools, Durval Marcondes is known in the historiography of psychoanalysis as one of the principal promoters of psychoanalysis in São Paulo. According to Sagawa (1989, 1994), Marcondes's first contact with psychoanalysis was through a text written by psychiatrist Franco da Rocha, the director of the Juquery Hospital for the Mentally Ill in São Paulo at that time, who published an article in 1919 in the newspaper *O Estado de São Paulo*, followed by a book intended for a general readership, entitled *O Pansexualismo na doutrina de Freud* [Pansexualism in the doctrine of Freud] and published in 1920. Although Marcondes was never a student of Franco da Rocha at FMSP, because the latter had retired from his position as professor of neuropsychiatry in 1923, the young physician was strongly influenced by him in his projects in the area of psychoanalysis.

In 1926, Marcondes, who in addition to his interest in medicine and psychoanalysis was enthusiastic about literature, participated in a selection process to become a professor of Literature at the Escola Normal (a teacher training institute) with the thesis "Aesthetic symbolism in literature. An essay on a literary criticism approach based on knowledge derived from psychoanalysis." He did not obtain the position, but his thesis was the starting point for direct contact with Freud via letter and also incentive for Marcondes to progress in his projects in the field of psychoanalysis. Thus, in 1927, together with other Brazilian physicians, educators, and writers, he founded the first *Sociedade Brasileira de Psicanálise* (SBP) [Brazilian Society for Psychoanalysis] and, the following year, the

periodical *Revista Brasileira de Psicanálise* as the society's official means of communication (de Oliveira, 2005; de Castro, 2014). However, they were both short-lived, as only one issue of the periodical was published and the SBP, focusing on talks and dissemination of psychoanalysis, lasted only a short time. In this context, the SBP created a section in Rio de Janeiro in 1928, called the *Sociedade Brasileira de Psicanálise – seção Rio de Janeiro* [Brazilian Society for Psychoanalysis – Rio de Janeiro section], which became the headquarters of SBP until the 1930s (de Castro, 2014), with the support of psychiatrists in Rio de Janeiro such as Juliano Moreira, Júlio Porto-Carrero, Murillo de Campos (1887–1968), and Carneiro Ayrosa (189?–1969) and the educator Deodato de Moraes. In Rio de Janeiro, psychoanalysis had already been employed in psychiatric clinics since the previous decade by physicians such as Juliano Moreira, and in the 1910s had begun to be disseminated and included in the training of educators (Facchinetti & de Castro, 2015).

In the early 1930s, Marcondes sought to bring a professor of psychoanalysis to Brazil in order to train the members of the SBP interested in becoming psychoanalysts and, thus, obtain accreditation of that institution by the International Psychoanalytical Association (IPA), but his initial attempts were unsuccessful. The establishment of the first psychoanalysis institute in Brazil along the lines of the IPA only occurred, however, in the late 1940s, in São Paulo, and led to the founding of a new SBP (1949–1969). The critical factor was the arrival in Brazil in 1936 of Adelheid Koch, an analyst from Berlin escaping Nazism. Soon after his arrival, Marcondes arranged for Koch to be a psychoanalysis instructor, authorized by the IPA, to train psychoanalysts in São Paulo, initially in study groups and later at the SBP, which was renamed the *Sociedade Brasileira de Psicanálise de São Paulo* (SBPSP) [Brazilian Society for Psychoanalysis in São Paulo] in 1969. Marcondes was president of the SBPSP and, in the 1970s, the Institute of Psychoanalysis was renamed in his honor (de Oliveira & Massi, 2011). The Psychology Institute of USP also paid tribute to his trajectory by giving his name to its School Clinic.

Marcondes published works about mental hygiene and psychoanalysis, the most important being: Os resultados do tratamento psicanalítico [The results of psychoanalytic treatment] (Marcondes, 1935); Noções de higiene mental da criança [Notions of mental hygiene of the child] (Marcondes, 1946); Medicina e psicologia [Medicine and psychology] (Marcondes, 1952); Posição da psicanálise na psicologia e na ciência em geral [Position of psycho-analysis in psychology and science in general] (Marcondes, 1970) and O conceito de interpretação em psicanálise [The concept of interpretation in psycho-analysis] (Marcondes, 1982).

Mariátegui Chiappe, Javier

Born *Lima (Peru), September 13, 1928*

Died *Lima (Peru), August 3, 2008*

Ramón León

Universidad Ricardo Palma, Lima, Peru

Keywords

Peru · Psychiatry · Mental health

Javier Mariátegui Chiappe was a Peruvian psychiatrist, son of José Carlos Mariátegui (1894–1930), the most important Latin American Marxist thinker. He studied medicine at the Universidad Nacional Mayor de San Marcos (UNMSM), graduating in 1956, and MD in 1972 at the Universidad Peruana Cayetano Heredia (UPCH). He was member of the National Academy of Medicine since 1987 (and become president from 1995 to 1997) and of the *Academia Peruana de la Lengua* (since 1993).

From 1957, he worked at the Víctor Larco Herrera Hospital (*Hospital Víctor Larco Herrera*) and in 1962 as head of the “Honorio Delgado” Mental Health Service (*Servicio de Salud Mental “Honorio Delgado”*) in Lima. He also entered teaching at his *alma mater*. After Honorio Delgado’s death (1969), he assumed the direction (until his death) of the *Journal of Neuro-psychiatry* (*Revista de Neuro-psiquiatría*) that Delgado and J. Óscar Trelles (1904–1990) founded in 1938. In the hard years (1985–1990) of the serious economic crisis of the Peru, Mariátegui managed to keep this journal, the oldest in psychiatry in Peru, to continue to be published.

In 1989, he founded the *Anuario Mariateguiano*, dedicated to the study of his father’s thought. He also animated for years the journal *Acta Herediana*, published by the UPCH, in which he stimulated the publication of papers not only of medicine but also of humanities.

In 1982, Mariátegui founded the Honorio Delgado-Hideyo Noguchi National Institute of Mental Health (*Instituto Nacional de Salud*

Mental “Honorio Delgado-Hideyo Noguchi”, INSM), an ambitious mental health project in Peru sponsored by the Peruvian state with the support of Japan, being its first director until 1987, when he was separated of the position due to a political decision of the first government (1985–1990) of Alan García (1949–2019), who appointed a person who was a sympathizer of his party, the APRA, to replace him. His separation led to numerous national and international protests, which is why the government decided to reinstate him as director (something that Mariátegui declined). His years as director of the INSM can be considered as the “golden period” of that entity due to the quantity and quality of projects and the assistance and research work carried out (León 2009). In order to publicize all this work, Mariátegui founded in 1985 and directed the *Anales de Salud Mental*, INSM’s journal.

When in 1961 Honorio Delgado, in company of numerous professors from the Faculty of Medicine of the UNMSM, resigned because he did not agree with the decisions of rector Luis Alberto Sánchez (1900–1994), Mariátegui was one of the group of resigners and also one of the founders of the Peruvian University of Medical and Biological Sciences (*Universidad Peruana de Ciencias Médicas y Biológicas*, today UPCH) that that group created. In the UPCH, Mariátegui promoted the publication of Delgado’s complete works, beginning with Freud and psychoanalysis (Mariátegui 1989a).

Mariátegui’s work includes also studies of literature and the history of Peruvian and Latin American medicine. Disciple of Honorio Delgado, his conception of mental health integrated psychiatry with psychology, anthropology, sociology, philosophy, and pedagogy, an integration that he considered essential to understand the complex social reality of Peru.

Mariátegui played a very important role in promoting research on Peruvian psychiatric and psychological issues, both through his works and those developed by his collaborators, and he also stimulated studies on the history of Peruvian and Latin American psychiatry (Alarcón et al. 1991). Through his journalistic articles, he made known to the general public the lives and ideas of some

leading figures of Peruvian and international medicine and culture.

Science is an enterprise of humanity where many people from different nations participate. When evaluating the progress achieved in the scientific knowledge and the contributions made in promoting a greater well-being in society, some individuals stand out. Such is the case of Gerardo Marín Carvajal, who as a researcher, teacher, and member of the community of psychologists in the region made multiple and very diverse contributions to the consolidation of psychology as a science, profession, and the guild both in Colombia and in the continent.

Gerardo Marín was a member of a Colombian family made up by Gerardo Marín Salazar and Noemí Carvajal Marín, who settled in the USA in 1964. He studied psychology in Chicago at the University of Loyola, receiving a Bachelor of Science in 1970. He also received a M.S. degree in general experimental psychology at DePaul University in 1972, and a Ph.D. in general experimental psychology also from De Paul University in 1979 (Organista & Balls Organista, 2018; Organista et al., 2010).

In his native country, Gerardo Marín spent several periods, the first of which corresponded

to his first years of life, and the second, as a psychologist, teaching, doing research and other professional activities of great significance for Colombian psychology (Giraldo & Rodríguez, 1997) and also for the Latin American region.

As a teacher, soon after obtaining his master's degree, Gerardo Marín returned to Bogotá and, during the 1970s, he worked for a short time at the Pontificia Universidad Javeriana (Pontifical Javeriana University) and later for a longer period at the Universidad de Los Andes (University of Los Andes) where he taught undergraduate courses (it is important to remark that at that time there were no graduate studies in psychology in Colombia). He wrote several impact publications on issues of psychological topics, particularly in experimental social psychology.

At that time, he was part of a small group of Colombian psychologists who had graduate training. Gerardo Marín tried to establish bridges between psychology in Colombia and psychologists from the Latin American region and, in general, from all of the Americas.

His efforts to establish ties between teachers and researchers from the continent, together with his initiatives for the diffusion and circulation of knowledge in the main languages of the region during those decades, secured him a prominent place in the discipline in the Americas and, in particular, in psychological areas such as social psychology, community psychology, and health psychology in Latin America, and later on in indigenous psychology and cross-cultural psychology in North America.

His leadership and commitment to the consolidation of scientific psychology in the Americas through academic projects that facilitated the dissemination of theoretical and empirical developments among psychologists of the region reached a high point with several reference books such as the *Research Manual in Social Psychology* (Marín, 1974), two volumes of *Social Psychology in Latin America* (Marín, 1975, 1981), *Readings of Contemporary Social Psychology* (Marín, 1978), and *Advances in Contemporary Psychology* (Finley & Marín, 1979). He was also instrumental in the foundation of the Latin American Association of Social Psychology – ALAPSO –

and in the organization of the Latin American Meeting of Social Psychology (Giraldo & Rodríguez, 2000) in 1974 in Bogotá.

Aware of the great differences that existed in the development of academic communities between the nations of the continent and, in the same way, knowing the difficulties that psychologists were going through in those countries where the discipline and profession was just beginning, he developed a strong interest in the consolidation of an academic community in the continent through its active participation in the Interamerican Society of Psychology, SIP (he was its president between 1989 and 1991), and in the creation of spaces that allowed circulation and the exchange of ideas and practices of psychologists of all regions of the Americas. Given several obstacles that made it difficult to access the main theoretical and empirical advances in the discipline in the world, Gerardo Marín, along with other leading psychologists on the continent, undertook several initiatives, such as publishing books and serial articles (in the *Interamerican Journal of Psychology*) and the organization of regional congresses (he collaborated in the organization of the Fifteenth Interamerican Congress of Psychology). Later on, as president of SIP he contributed to the organization of the Iberoamerican Congress of Psychology in 1992 in Madrid (Spain).

Thanks to those efforts, he was distinguished in 1995 with the Interamerican Psychologist Award in the English version granted by the Interamerican Society of Psychology (SIP) for his career and contributions to the Psychology of the Americas.

After moving to the USA, Gerardo Marín received his Ph.D. training in Chicago. He worked from 1982 to 2016 at the University of San Francisco where he consolidated and diversified his career with new thematic fronts that included the Latino population and, in general, migrants residing in the USA, cultural issues, and health psychology. At the University of San Francisco Gerardo Marín, together with his teaching, research, and union activities, also held administrative positions of an academic nature such as dean and vice president of said institution; he

promoted a training of quality and inclusiveness, which means an effective opportunity for personal and professional development for residents not only from the USA and Latin America but also from other nations of the world. He was one of the founders of the Center for Latina/Latino Studies at the same university (Ardila, personal communication, July, 2018).

It is also important to note that, around this same time, he carried out outstanding tasks in his role as an expert in institutions such as the Center for Latino Studies at the University of South Florida (Mazeyra Zúñiga, 2018) while he continued assuming responsibilities and carrying out activities that contributed to the consolidation of the discipline in both English and Spanish. Marín participated in editorial committees of high impact journals such as the *American Psychologist* and the *Journal of Personality and Social Psychology* (Organista et al., 2010).

Finally, Gerardo Marín not only received recognition from the psychological community, his career was worthy of distinctions issued by government health institutions in the USA. The University of San Francisco, for his interest in creating spaces of interaction between academics from diverse social and cultural backgrounds, established the Gerardo Marín Diversity Scholars Program that supports advanced students from ethnic minorities (Mazeyra Zúñiga, 2018).

His work is quite extensive, with more than a hundred publications including articles, chapters, and books, as author, editor, or compiler, which cover a wide range of topics. He also coauthored several scales to measure acculturation, cross-cultural methodology, and other topics. In short, Gerardo Marín contributed to the consolidation of scientific psychology in various specialties, fostered interaction between members of the community from across the American continent, and thereby promoted a teaching, research, and intervention activity governed by the values of psychology as a scientific discipline.

Marín Rojas, Juan

Born *in Talca (Chile) on March 23, 1900*

Died *in Viña del Mar (Chile) on February 10, 1963*

Mariano Rupérthuz Honorato
Universidad Andrés Bello, Santiago, Chile

Keywords

Chile · Popular psychoanalysis · Antifascism · Psychological pedagogy

Juan Marín Rojas was a Chilean doctor, diplomat, and writer; after a poetic debut with a futuristic stamp, he focused on the novel and the essay, including psychoanalysis as one of his main specialties. In 1921, he graduated as a surgeon at the *Universidad de Chile* (University of Chile). Then, Marín entered the *Armada Chilena* (Chilean Navy), where he worked, since 1929, as a doctor in the National Squad. From 1932 to 1934, he practiced his profession at the Punta Arenas Naval Hospital in southern Chile. In 1939, he entered the Chilean diplomacy, which allowed him to travel the world, especially the countries of the East: China, India, Tibet, and Egypt. Thanks to these destinations, his work penetrated the landscapes and cultures that he lived in those places (Marín, 1954, 1956). Thanks to his writings, he obtained the Santiago Municipal Prize in 1936, the *El Mercurio* Short Story Prize (1937), and the Athena Prize from the *Universidad de Concepción* (University of Concepción) (1954).

Today, it is possible to say that Juan Marín was one of the foremost popularizers of psychoanalytical ideas in Chile, in the 1930s, and dedicated a good part of his career to disseminating the teachings of Freud. His interest in psychoanalysis came from his training as a physician, despite the fact that Marín never had instruction in psychiatry, nor did he practice it. Apparently, Marín's interest in Freud's theories was related, on the one hand, to his life as a writer and intellectual, understanding Freud's theories as a broader frame of reference for societal and cultural phenomena (Rupérthuz, 2012), and, on the other hand, it is possible to say that his work, as a physician at a venereal disease center, helped him to postulating the need for the general population to have sex education and uses Freud's ideas (Marín, 1937).

One of Juan Marín's most essential works in the psychoanalytic field was his 1938 book, *Ensayos Freudianos* (Freudian Essays) (Marín, 1938), and he sent a copy of the book to Freud (Plotkin & Rupérthuz, 2017; Rupérthuz, 2016). In this work, Marín introduced psychoanalysis as a broad theory that was born from medicine but managed to account for the real origin of scientific constructions, artistic realizations, and religions. Freud is seen as someone "rejected," a victim of harassment that hurt him, same as Giordano Bruno, Galileo Galilei, and Socrates. For Marín, Freud's precursors are Nietzsche and Schopenhauer, in particular for the weight they gave to the unconscious motivations in human conduct. Additionally, he reclaims Carl Jung's contributions about the collective unconscious, which, according to him, emphasize the archaic origins of the human mind. Marín's point of view is prizing psychoanalysis for its capacity to discover how the perverse and uncontrolled nature of the human being is transformed thanks to the role of sublimation, based on the psychic dynamism. The gods, for Marín, are sublimated men, parental imagos that the religious myths sustain, who rise thanks to the other myth of "the original sin"; Marín considers Darwin, Marx, and Freud as the great authors of humanity, especially for their power to liberate the human being from the yoke of religions and

their power. Marín shows psychoanalysis as a liberating discipline, given that it leaves behind the obscurantism of the traditional models of coexistence – such as the bourgeois moral, governed by religious norms – a discipline that becomes fundamentally committed to “betterment.” That is, the human being can surpass himself, climbing to ever-higher states of personal and collective development.

In 1938, Juan Marín was assumed as President of *Sociedad Médica de Valparaíso* (Medical Society of Valparaíso) and supported by the *Alianza de Intelectuales para la Defensa de la Cultura* (Alliance of Intellectuals for the Defense of Culture) – headed by Pablo Neruda – and the *Sociedad de Escritores* (Society of Writers) and asked the *Universidad de Chile* (University of Chile) to give Sigmund Freud political asylum on Chilean soil. In this sense, the antifascist fight of the *Alliance* managed to awaken a strong repercussion in the medical circle, where Marín participated too in the *Anti-racism Committee of Valparaíso*. Given these sensibilities, Marín wrote in the *Aurora de Chile* – official publication of the group – where he made a call to physicians, lawyers, engineers, journalists, writers, professors, and musicians to understand that Fascism was an enemy of culture since it deprived mankind of its fundamental right: the right to freedom of thought (Ruperthuz, 2017). Finally, the University of Chile did not endorse this initiative due to a lack of funds. However, it showed how Freudian psychoanalysis was valued beyond specialized professional circuits. Juan Marín remained adherent to Freudism until his death in Viña del Mar in 1963.

Brazil · Education · Teacher training · Educational psychology

In 1910, Heloisa Marinho began her studies at the American School of Petrópolis, a Methodist school where she studied elementary and middle school. In 1919, she joined the technical high school course for young adults at Bennett School in Rio de Janeiro. Simultaneously, she attended the training course for elementary teacher (called Normal Training Course, in Brazil). She traveled to the United States in 1923 to continue her studies at Wesleyan College, Macon Georgia, and Peabody College of Teachers. Between 1925 and 1928, Heloisa Marinho studied at the University of Chicago. She graduated in psychology followed by a specialization in philosophy (Leite Filho, 2000).

In 1929, Heloisa Marinho returned to Brazil and succeeded to be a professor of general psychology at Bennett School. Five years later, she started teaching at the School of Teachers of the Educational Institute of Rio de Janeiro (IERJ), as assistant to Professor “Manoel Bergstrom Lourenço Filho”, in Educational Psychology course. In 1936, she was invited by the University of the Federal District (UDF) to study Gestalt Psychology at the Frankfurt University, Germany (Leite Filho, 2000).

In 1938, Heloisa Marinho was appointed professor of Educational Psychology course in the Faculty of Education at UDF. During the same year, she taught Genetic Psychology Course for primary teachers at IERJ (Leite Filho, 2000). In 1939, Heloisa Marinho launched a new Technical Institute (IT) at Bennett School whose goal was the preschool teacher training course. In 1942, she held the position of full professor of educational psychology at IERJ (Kuhlmann, 2005).

In 1949, she organized the Higher Education Course for preschool educators at IERJ. At the same institution, she coordinated the Child Study Center. Heloisa Marinho led the training courses for all preschool teachers from public education of Rio de Janeiro. In 1951, she became director of the Normal Course at Bennett School (Leite Filho, 2000).

In 1952, she published her first book, about the educational function of kindergartens and their supportive environment for life. This book was used as a preschool education guide for many teachers. In 1957, as the result of research developed under her guidance, Heloisa Marinho launched the Brazilian Child Physical, Psychological and Social Development Scale (Leite Filho, 2000).

Inspired by structuralist principles and the ideas of Froebel (1782–1852) and Dewey (1859–1952), Heloisa Marinho created the Natural Method based on the individual natural transformations during the reading system growth (Oliveira, 2012). She stood for a ludic and free education that valued the child’s creativity, the experience as knowledge, and the protagonism of the student in the learning process. Based on the ideology of the New School, Heloísa Marinho aimed an education that respected the child rhythm (Kuhlmann, 2005).

From 1966 to 1975, she organized and coordinated the Special Pedagogy Course at IERJ. In 1976, she created the Helena Antipoff Research Center (CPHA) at Pestalozzi Society of Brazil, in order to organize courses and university research focused on education processes and human development. In 1979, she was part of the Child Development Center (NDC) at Bennett, later known as the Bennett Institute for Child Development. In 1982, she founded the Heloísa Marinho Research Institute (IPHEM) in partnership with Dr. Jairo Werner Júnior (1953–) (Leite Filho, 2000).

On the whole, Marinho focused her investigations on the child and structured her studies in three axes: teacher training, curriculum, and language study (Reis, 2014).

She had an outstanding career among Brazilian educators, and she was known as “the educator of the educators” of the kindergartens in Rio de Janeiro. Her professional career was based by teaching and organizing several training courses for teachers of preschool education, as well as literacy courses and special pedagogy. She was a great inspiration of the educational reforms of the twentieth century, being one of the most active voices in defense of early childhood education in Brazil (Leite Filho, 2000).

Heloisa Marinho contributed with fundamental knowledge for child and educational psychology, and her studies and research aimed mainly at teacher training. The relevance of the child development, the role of language and playing in the learning process, and the observation of the child behavior were marks of her thought in the articulation of pedagogical and psychological fields.

El Salvador · Liberation Psychology · Social Psychology · Jesuits

Ignacio Martín-Baró is the most prominent psychologist from El Salvador and one of the most provocative Latin American thinkers in psychology during the last quarter of the twentieth century (for an expanded review, see Portillo, 2012). Trained in philosophy, theology, and psychology, he was a gifted writer and a prolific author of over 150 published works particularly in the areas of social and political psychology. His greatest intellectual contributions were his psychology of liberation, the first academic public opinion institute founded in the country, and the largest collection of studies ever written by a Salvadoran psychologist. Because of his academic work and his social commitment as a Jesuit priest, he paid the ultimate price along with his brothers and sisters at the University of Central America's massacre. His ideas have influenced critical scholars and practitioners around the world, interested in furthering his vision and creating a more just world.

José Ignacio Martín-Baró was born on November 7, 1942, the fourth child of renowned writer, poet, and local chronicler Francisco J. Martín Abril and Alicia Baró, in Valladolid, the capital of Castile and Leon in northwestern Spain. Nacho, a typical nickname for Ignacio, was marked early on by the Society of Jesus not only because he shared the name of the order's founder, Ignatius of Loyola (1491–1556), but also because he was educated by them during part of his childhood.

Martín-Baró was raised during the Spanish post-civil war years by a devoted Catholic family. Following in the footsteps of two brothers who were aspiring Jesuits and a sister who was a Carmelite nun, he responded to God's call by joining the Jesuit order as well. Shortly before his 17th birthday, he entered the Novitiate of Orduña in Vizcaya on September 28, 1959. From Orduña, he was transferred to Villagarcía de Campos, back in Valladolid, but very soon had to pack again and was sent by his superiors with other Jesuit brothers to El Salvador, where he completed his second year as a novice at the novitiate of the Society of Jesus in Santa Tecla in September of 1961.

From El Salvador, Martín-Baró travelled in 1961 to Quito's Catholic University in Ecuador

where Jesuit novices went to study classical humanities for 2 years. However, he transferred to Javeriana University in Colombia the following year to continue his studies in philosophy. There, he obtained his certificate in philosophy in 1964 and a bachelor's in philosophy in 1965. While completing his degrees, he found his true intellectual calling –psychology – and combined it masterfully with his studies in philosophy. His philosophy degree thesis, *To Be and To Suffer* (Martín-Baró, 1964), was the product of a seminar on existentialist psychology.

His Colombian period (1962–1965) also marked the beginning of his career as a dedicated and prolific writer at the early age of 22. His first published works dealt with clinical psychology, and his early interests in psychology were focused mainly on existentialist and psychoanalytic therapeutic approaches and theories. He developed a special fondness for logotherapy and an admiration for Austrian psychiatrist Viktor Frankl (1905–1997), who was one of his main referents for his philosophy degree thesis.

Moved by a fascination with Frankl's work and by his academic self-confidence, Martín-Baró wrote directly to the famous Austrian psychiatrist to describe his experiences with Colombian indigenous people. During that time, he had begun working as a clergyman in the dense jungles of El Chocó (near the Atlantic coast) with Afro-Colombian indigenous communities. This experience left a deep mark on him as he tried to understand the social roots of fatalism among disenfranchised people from the perspectives of logotherapy and existentialism.

Martín-Baró had also expressed to Frankl his interest in studying under him in Vienna. Impressed by his letters, Frankl welcomed him to come to Vienna, but he advised him to study experimental psychology in the United States first, in a phenomenological-existentialist program. Frankl was very specific and recommended that Martín-Baró attend Duquesne University in Pittsburgh, where logotherapy was taught. Although he never went onto studying in Vienna or Pittsburgh, his exchange with Frankl marked an early milestone in his career and what would become his own approach to psychology.

In 1965, Martín-Baró returned to El Salvador and started working at the Jesuit school, Colegio Externado San José (Beirne, 1985), where he took on the challenge of mastering several subjects while serving as the school's discipline prefect and library director for 2 years. In 1967, he started teaching philosophy at the University of Central America (UCA), but he left his post that same year to begin his studies in theology at Sankt Georgen Graduate School of Philosophy and Theology in Frankfurt, Germany. At Sankt Georgen, he coincided with Jon Sobrino (1938–), a UCA fellow brother who later became one of the main figures of Liberation Theology. Martín-Baró was, nevertheless, disenchanted with the atmosphere in Frankfurt and decided to transfer to Belgium's Catholic University of Louvain. With his ability to learn new languages, Martín-Baró took on French and rapidly became proficient. He combined his studies with pastoral duties during the weekends when he often worked with Spanish immigrants in Brussels. He returned to El Salvador in 1969 to complete his theology degree, but shortly after, he left for Europe again to finish it in Eegenhoven, Belgium, in 1970. Later that year, he was ordained and took his final vows as a Jesuit priest in his native Valladolid.

While studying theology, he formally began his undergraduate studies in psychology at the UCA, which he completed in 1975. There, he was mentored by Jesús Arroyo Lasa (1925–?), a Basque Jesuit who had studied applied psychology and psychoanalysis in Innsbruck and was an enthusiast of Marxist social psychology. Authors like Paulo Freire and Herbert Marcuse (1898–1979) and the like became referents for Martín-Baró, thanks to Father Arroyo. Under his guidance, Martín-Baró published in 1972 his first book, which contained early psychoanalytic views that he later shed and the seeds of what later became his liberation psychology. At that point, he had written 26 articles and become head of the editorial committee of the prestigious Jesuit journal *Central American Studies* (known as ECA for its acronym in Spanish), which he directed between 1975 and 1976. While still an undergraduate student, he had also started teaching psychology courses at the National School of Nursing in 1971 and at the UCA in 1972.

Immediately after finishing his undergraduate degree in psychology, Martín-Baró was awarded a Fulbright scholarship to pursue graduate-level studies in the United States. He completed his master's degree in 1977 and his doctorate in 1979 at the University of Chicago. For his master's thesis, he studied social attitudes and group conflicts in El Salvador, and for his dissertation, he focused on crowding among low-income Salvadorans. His mentors included well-known psychologists such as Milton J. Rosenberg (1925–2018), Salvatore Maddi (1933–), Suzanne (Kobasa) Ouellette (1948–), Norman Bradburn (1933–), and Mihály Csíkszentmihályi (1934–). As was usual in every place where he lived, Martín-Baró combined his studies with pastoral work during the weekends.

In 1979, Martín-Baró finally returned to El Salvador and to the UCA, to stay for good this time as a consecrated scholar and as a Salvadoran citizen. During his Chicago period (1976–1979), many things that influenced him had occurred in El Salvador and Latin America, including the III General Conference of the Latin American Episcopate in Puebla in which the preferential option for the poor was adopted, the rise of Liberation Theology and its emphasis on the plight of the oppressed, the persecution of the Salvadoran church, and most importantly the increasing radicalization of leftist and right-wing forces in the country.

As the sociopolitical tensions were reaching a point of no return in 1979, Martín-Baró decided to put his vast knowledge to work for the social change that he saw coming to El Salvador. He answered the call by becoming a militant psychologist and started actively collaborating with a psychology network organized by the People's Forces of Liberation (known as FPL), one of the main leftist organizations in the country. The psychology network was part of a larger clandestine health network coordinated by Eduardo Espinoza Fiallos (1949–), a medical doctor and professor at the National University of El Salvador (personal communication, June 2, 2019). Martín-Baró, whose nom de guerre was "Chungo," was introduced to the network by Ethel Pocasangre Campos (c. 1953–1986), alias "Crucita," a

psychologist working at the UCA and later killed by her own FPL comrades. He offered psychological counseling, diagnosed mental health issues, gave talks, and provided insightful analyses of the affairs taking place before the war broke out. He went as far as conducting a study of the guerilla fighters' morale in one of their main strongholds in the Chichontepec Volcano in 1980. This militant period lasted about 2 years and ended when the network coordinators moved to the war front at the end of 1980. Some of his experiences as a militant psychologist are covertly reported in his unpublished work, *Psychosocial Roots of War in El Salvador* (1981). There, Martín-Baró stated that his reflections about the Salvadoran conflict were produced not in the vacuum, but through his "active participation in the [historic sociopolitical] processes [that took place in 1980]" (Martín-Baró, 1981, p. 19). A great deal of Martín-Baró's intellectual production would later deal with the role of both psychology and psychologists as agents of change in processes of social conflict and liberation.

Martín-Baró continued his work for social change for the rest of the 1980s both as a scholar and a priest. At the UCA, he juggled several administrative posts (vice-rector, member of the board of trustees, chair of the psychology department, and director of research programs) as well as academic duties (instructor, principal investigator, director of the University Institute of Public Opinion, and student advisor). Despite his rich intellectual and academic life, Martín-Baró was happiest among the modest people of Jayaque and its vicinities, a village where he worked as a priest. He comforted, gave strength, and helped the poor to improve their material and spiritual conditions. Earlier in the 1980s, he had also worked in Zacamil, a large working class neighborhood in the north of San Salvador.

Martín-Baró's academic prestige and visibility skyrocketed in the mid-1980s, and he became a keynote speaker in high demand at national and international events. In the context of the Interamerican Congresses of Psychology organized biannually by the Interamerican Society of Psychology (known as SIP for its acronym in Spanish), he met some of his closest colleagues

and started playing a leading role in the field of psychology in Latin America. In 1979, at the 17th Interamerican Congress of Psychology, he met Silvia Lane, one of the most influential social psychologists in Brazil. At the 20th Interamerican Congress of Psychology held in Caracas in 1985, Martín-Baró gained major notoriety for his poignant ideas about the role of psychology as an instrument of change. In the same event, he became vice-president for Mexico, Central America, and the Caribbean of SIP. He had been invited by Maritza Montero, an influential Venezuelan social psychologist with whom he shared not only a close friendship but also a vision for a more committed and critical psychology. In 1986, he was reelected for the same position, and the following year, he initiated his second term at the 21st Interamerican Congress of Psychology held in Havana, Cuba. He received posthumously the Rogelio Díaz-Guerrero Interamerican Psychology Award from SIP in 1991. In 2019, SIP named its Student Award in honor of Martín-Baró who, coincidentally, was part of the group that conceived and introduced it originally in 1989 (Sánchez, 1990).

For Martín-Baró, traveling was not a perk of the academic intelligentsia; it was a strategy to survive by being in the public eye and a way to serve as a witness who could denounce the atrocities of war and the human rights violations inflicted by the Salvadoran government with the help of the United States. Martín-Baró traveled much more frequently to the United States than anywhere else in order to let people know what their government was doing “in their backyard.” He started close relationships with activist psychologists Adrienne Aron (1941–) in the West coast and with M. Brinton Lykes (1949–) in the East coast. Both friends helped him to organize talks and visits to key places.

Martín-Baró had a love-hate relationship with the United States even before the Salvadoran civil war started. He was well-versed in the topic of North American foreign affairs, and he distrusted almost everything that came from there, including the psychology originating in the United States. Studying in the United States was a form of getting to know the enemy from inside. In his two

main handbooks of social psychology from Central America, published in the 1980s, he opened a North-South dialogue rarely seen in the academic books on psychology available in Latin America, then or now. Martín-Baró not only articulated sharp critiques of American psychology but also proposed provocative ways to break away from it. A telling aspect of his deep-seated sentiment was his determination to write in Spanish only, despite the fact that Martín-Baró was fluent in English. Ultimately and regrettably, this decision put his writings at risk of going unnoticed by English-speaking scholars in the United States and beyond. A small selection of his works is available in *Writings for a Liberation Psychology* (Martín-Baró, 1994).

Friends and colleagues stood in solidarity with Martín-Baró and often advised him to be careful and leave the country if possible. He turned down several job offers in prestigious institutions, and instead, he asked for help in the form of books, travel funds, and moral support. He opened other channels of communications within academia in specialized journals such as the *Journal of Psychology of El Salvador*, group-edited books, and editorial committees. He accepted short visiting posts in the Central University of Venezuela, Zulia University, University of Puerto Rico, Javeriana University, Autonomous and Complutense Universities in Madrid, and the University of Costa Rica. By the end of his career, he had edited, compiled, or penned more than a dozen books and over 150 articles. He is best known for pioneering what he named liberation psychology (Martín-Baró, 1994), his own proposal of what a political and critical social psychology should aspire to be. With very few exceptions, he wrote most of his work as the sole author.

In 1986, Martín-Baró launched the University Institute of Public Opinion (known as IUDOP), one of his most ambitious research projects. In a context of propaganda and fear to express one's opinions, he established the first academic and independent polling research center in the country with the objective of creating an unfiltered channel that would measure reliably and systematically the opinions of Salvadorans about relevant issues and current developments (Martín-Baró,

1987). In that sense, he conceived public opinion research as a de-ideologizing instrument that could reveal the true sentiments of the Salvadoran people and the manipulation of reality and common sense. Thanks to a grant from the German Catholic Bishops' Organization for Development Cooperation (MISEREOR), his institute assembled a professional team that would conduct 23 national polls between 1986 and 1989. Many of his findings were published in two volumes (Martín-Baró, 1987, 1989). The institute gained prestige and became one of the most trustworthy sources of information in the country and abroad. He was equally attacked by the right and the left because his findings did not align with either ideological position. Sometimes military personnel would confiscate surveys to his team while conducting field work. His polls on the Salvadoran peace process were critical to show that the population favored a negotiated exit to the war and to dissuade the US congress to stop sending military aid to El Salvador. The institute is still active at the UCA after 34 uninterrupted years.

Beginning in 1987, the situation in El Salvador had become so difficult that he went into hiding for short periods of times. That same year, in his visit to Cuba, he told English psychologist Alison Harris (1990) that he had declined to appear on Cuban national TV because it would most certainly bring some kind of retaliation in El Salvador. He told her that he knew the rules that he could break without exposing himself to serious danger.

Toward the end of his life, his health deteriorated. In his last visit to Spain in 1989, his brother Carlos saw a nervous and overtired Martín-Baró with several medications on top of the nightstand. The end came about 2 weeks after his 47th birthday, during the early hours of November 16, 1989. Still dressed and awake, Martín-Baró was working when an elite military squad of the Atlacatl Battalion forced its way into the university campus and the Jesuit residence, using as a pretext a major operation launched by the guerrillas of the FMLN, 5 days before. The militia had come with orders to eliminate Ignacio Ellacuría (1930–1989), UCA's rector, and leave no witnesses. In total, six Jesuit priests were massacred

along with their cook and her daughter. According to the account given by Lucía Barrera de Cerna, the only witnesses of the crime, it was Martín-Baró who told his executioners before dying: "This is an injustice. You are carrion" (Bergman, 1998, p. 52).

His assassination cut short his intellectual production at a very early age, but his ideas have received greater attention and created a strong movement of psychologists across the globe in the years that followed. In Latin America, Montero played an important role disseminating and expanding the work of Martín-Baró since his death. In Spain, Blanco organized many of the works of Martín-Baró in two volumes (Martín-Baró, 1998; Martín-Baró, 2003). In Mexico, Pacheco and Jiménez published the first compilation of Martín-Baró's works available after his death (Martín-Baró, 1990). While most of the production related to Martín-Baró is available in Spanish, a selection of his writings are available in Portuguese (Martín-Baró, 2017), in Italian (Martín-Baró, 2018), and German (Riquelme, 1990). Montero and Sonn edited in 2009 the first work in English that systematically analyzed and built on Martín-Baró's liberation psychology. Outside Latin America, Geraldine Moane (1999) was among the first authors to use liberation psychology. Signaling the greater influence and acceptance of Martín-Baró's ideas into mainstream psychology, the American Psychological Association (APA) published *Liberation Psychology: Theory, Method, Practice, and Social Justice* (Comas-Díaz & Torres Rivera, 2020).

The growth of the liberation psychology movement mirrors the increasing relevance of Martín-Baró in global psychology. In Latin America, the movement grew out of the International Congresses of Social Psychology of Liberation held between 1998 and 2016 in several countries. The contributions presented in some of the meetings have also been published (e.g., Guzzo & Lacerda Jr, 2009). Abroad, critical and community psychologists (e.g., Kagan et al., 2011; Nelson & Prilleltensky, 2005) have introduced Martín-Baró's liberation ideas to problematize and decolonize psychological knowledge and practice. His ideas have been discussed in many of the International Conferences of Community Psychology

held between 2006 and 2020 as well. From critical to mainstream psychology, Martín-Baró remains one of the most prominent figures of psychology coming from El Salvador and Latin America.

Martínez Mont, Luis

Born **Huehuetenango, (Guatemala), 11 October 1901**

Died **Lima, (Peru), 25 June 1967**

Ramiro Tau

Université de Genève, Geneva, Switzerland

Keywords

Guatemala · Switzerland · Institut Jean-Jacques Rousseau · School of Geneva · League of Nations · Development · Moral judgment

He studied pedagogy at the Instituto Nacional Central para Varones (Central National Institute for Boys), Guatemala (1923), he obtained a certificate in Pedagogy from the Institut Jean-Jacques Rousseau (1930), and a Doctorate in Philosophy with a mention in Pedagogy from the Université de Genève (University of Geneva), Switzerland, where he also collaborated with Jean Piaget (1896–1980) in the study of children’s appropriation of norms.

Juan José Arévalo (1904–1990), who would later become president of Guatemala, was one of his teenage friends and a fellow student at the Instituto de Formación de Maestros (Teachers’ Training Institute) since 1918. About those formative years, Arévalo later wrote that “from the first days his cultural superiority over all of us was evident. He read literary books, wrote acclaimed verses and spoke admirably” (Arévalo, 1963, p. 300, our translation). In 1923, together with Arévalo and Barrera Rodríguez, Martínez Mont co-founded the pedagogical-literary journal “Alba.” He also worked on the 1925 Project to Reform the Guatemalan Teachers’ Curriculum, and towards the end of 1926, he was appointed Oficial Mayor en Educación Pública (Principal Officer in Public Education) (Arévalo, 1970).

As a result of his outstanding grades, in 1927, he won a competitive government scholarship to study pedagogy abroad. He thus arrived at the Jean-Jacques Rousseau Institute of the University of Geneva (precursor of the Faculty of Psychology), where he first studied Pedagogy (1927–1930) and then he joined the Faculty of Letters to continue his doctoral studies in Philosophy with an orientation on Pedagogy (Université de Genève, 1930a). During the years 1929–1930, he carried out a research under the direction of Jean Piaget (1896–1980) and Germaine Guex (1904–1984), on “the rules of a girl’s game” (Université de Genève, 1930b). His interest in the development of moral judgments and the appropriation of norms during childhood was reflected in the book *Le jugement moral chez l’enfant (Moral Judgment in the Child)* (Piaget et al., 1932), in which he participated as a research collaborator and co-author of the first chapter, together with Valentine Châtenay (1899–1983) and Marc Lambercier (1890–1972).

During those years, he joined the Société des Nations (League of Nations, SDN, 1930) to complement the income of the scholarship that the Guatemalan government had decided to cut back during that time. The difficulties to fully engage in academic activities forced him first to delay his studies and then to interrupt the completion of the doctoral thesis he had planned to write. In fact, in addition to his university duties, during those years he represented the Guatemalan government as Secretary and Head of the national delegation for the League of Nations. Among other activities, in 1930, he took part in the International Labor Conference held in Geneva. In July 1931, he signed the “Convention for Limiting the Manufacture and Regulating the Distribution of Narcotic Drugs,” as well as other international agreements and declarations (SDN, 1933). In the same city, in 1934, he participated in the Third International Conference on Public Instruction, where he was in charge of a session dedicated to contemporary developments in education (Le Temps, 1934). In 1935, after an 8-year stay in Switzerland, he returned to Guatemala, where he was quickly appointed Head of the country’s Normal Education Section (1936–1937), then Director of the Central Normal School for Boys (1938–1939), Professor at the Universidad de Guatemala (University of Guatemala) (1939–1942), and member of the Sociedad de Geografía e Historia de Guatemala (Guatemalan Society of Geography and History) (1941–1946). It is mainly because of his participation in public service during this period that, despite his few publications, he is still remembered today as a reference in teachers’ training and educational reforms in his country.

After a decade of collaboration in the public sector, the political situation in Guatemala changed completely. In the aftermath of 1944 revolution, many collaborators of the previous government of Jorge Ubico Castañeda (1878–1946) had to go into exile. Martínez Mont emigrated to the United States (Notas Varias sobre Hispanismo, 1944), where he was hired by Walt Disney (1901–1966) as an educational consultant (Sandoval, 2012). After 2 years in New York, he returned to Geneva and joined the Spanish team of the Editing and Translation

Division of the International Labor Organization (Payró, 2019). As part of the tasks requested by this international organization, he travelled to Brazil and then to Peru, where he died in the city of Lima in June 1967.

Martínez, Juan Nicolás

Born on July 7, 1915, in Caguas, Puerto Rico

Died on July 5, 2002, in San Juan, Puerto Rico

Irma Roca de Torres

University of Puerto Rico, Río Piedras, San Juan, Puerto Rico

Keywords

Puerto Rico · Clinical psychology · Measurements · Graduate education

Juan Nicolás Martínez was born in a rural area of central Puerto Rico (PR). At birth, he presented symptoms of albinism, a genetic condition that implies low visual acuity. At the beginning of his school career, he was registered at a special school for children with visual disabilities. As the developments of the science of optometry progressed, he was able to increase his eyesight with proper correction glasses and transferred to a regular public school in Caguas, where he graduated with the highest honors. He studied for his high school degree at University High School, a

semi-public school administered by the University of Puerto Rico (UPR-RP). After his graduation, he entered college at UPR-RP, where he graduated in 1935 from Normal School, a two-year program to prepare school teachers (Roca de Torres, 2006).

He earned a scholarship and registered at Columbia University, New York City, where he completed, in 1938, a Bachelor of Science with double majors in psychology and education of exceptional children (today, children with functional diversity). At this time, he returned to Puerto Rico to teach English at various public schools of PR. At the same time, he traveled frequently to Columbia University to pursue studies toward a master's degree in educational and clinical psychology. By 1942, he had finished all his master's requirements and was ready to turn in his thesis, but on his way to Columbia University, he was in a plane accident where he was one of five survivors, but his master's thesis document did not survive (Roca de Torres, 2006). This experience was not enough to discourage him. Although he did not write again his lost thesis, he kept taking courses and finally turned in another thesis and obtained his master's degree in educational and clinical psychology in 1953.

Many of the courses Juan Nicolás Martínez took at Columbia during more than ten years of studies were in clinical psychology, but for diverse reasons, including financial, he transferred to New York University where he finished his PhD in 1958 in the area of human relationships (Personnel Record, 1948–1974). During his years at Columbia University and New York University, he studied with Goodwin Watson, Irwin Lodge, and Virginia Axline, among others. The title of his dissertation (1957) was *The attitudes and concepts of Puerto Rican professionals regarding mental illness: An exploratory study of a group of Puerto Rican professionals: medical doctors, social workers, nurses, teachers and religious workers*.

Juan Nicolás Martínez had a variety of jobs during the 1940s. From 1942 to 1944, he was director of San Juan Youth House, an institution for orphaned children. He was director of the Department of Psychology of the Psychiatric Hospital from 1944 to 1961. During this time, he also

worked part-time at Office of Vocational Rehabilitation of the Veteran's Administration Hospital. At the end of the decade, he opened a private office for the practice of his profession (1947) and started teaching psychology courses part-time at UPR-RP (1948). He also worked as a clinical psychologist at the Psychiatric Institute of PR. He kept collaborating with these institutions until 1966 (Roca de Torres, 2006).

When Juan Nicolás Martínez finally finished his PhD degree, he accepted a full-time teaching position at UPR-RP and being a director of their Program of Psychology. His collaboration with all mentioned institutions allowed for those of us who were his students to gain valuable practical experiences. He used to say, "you always have to put the student in contact with the people" (J. N. Martínez, personal communication, June 11, 1993).

He was the first director of the Program of Psychology at the Faculty of Social Sciences, UPR-RP, to remain at his post for four years, which gave stability to this program of studies and allowed him to stimulate the creation of a Department of Psychology and a graduate program of this discipline. These achievements were attained after he was no longer the director but were a product of his management. During his years at UPR-RP, he continued his private practice in the metropolitan area and opened a private office in St. Thomas to offer psychological services to children that at that time were not available in the Virgin Islands.

He enjoyed participating in international congresses of psychology in Europe, Latin America, and the United States. He frequently went to conferences organized by the Interamerican Society of Psychology, International Association of Applied Psychology, Spanish Association of Psychology, Interamerican Association of Rehabilitation Counseling, Association of Psychosomatic Medicine, American Psychological Association, and Puerto Rico Psychological Association, among others (Roca de Torres, 2006).

His research, as many of the psychologists of his time, was centered in the development of psychological instruments to measure cognitive abilities. With a group of collaborators, Dr. Martínez

translated to Spanish and adapted and standardized the Wechsler Adult Intelligence Scale (WAIS) (Green and Martínez, 1967). This instrument was used for 40 years, until 2008 when a translation, adaptation, and standardization of the WAIS-III was done by a group of researchers directed by Dr. José Pons (Pons et al., 2008). He also developed a standardization process for the WISC for the children of the Virgin Islands, a territory of the United States. Dr. Martínez also did a comparative study of the personality of children of Puerto Rico and the Virgin Islands.

Dr. Juan Nicolás Martínez finished his academic life as associate dean of studies and interim dean of studies at UPR-RP. He retired in 1974 and was named *emeritus professor*. This distinction was added to other honors bestowed on him by the Puerto Rican Psychological Association and by the Department of Psychology of UPR-RP for his contributions to the development of psychology in Puerto Rico.

After his retirement, Dr. Juan Nicolás Martínez lived a tranquil and peaceful life accompanied by Carmen, his wife of many years. His only son Piero died before his father. Dr. Martínez was survived by his daughter-in-law, Diana; his granddaughter, Michelle; and his students and colleagues who remember well his lessons about responsibility and ethics of our profession

Postgraduation

Upon concluding of a Foundation Degree in Primary Teaching and Learning in 1941, at Instituto de Educação Caetano de Campos (Caetano de Campos Institute of Education), Joel obtained a degree in Philosophy and Pedagogy in 1945, at the Faculdade de Filosofia, Letras e Ciências Humanas (Faculty of Philosophy, Languages and Human Sciences) of Universidade de São Paulo (University of São Paulo) (USP), when he began to take important positions at the Secretaria de Educação de São Paulo (Department of Education of São Paulo). He was headmaster at Instituto de Educação de Espírito Santo de Pinhal (Espírito Santo do Pinhal Institute of Education) in São Paulo and at Escola Normal Pe. Anchieta (Father Anchieta Foundation School), in 1948–1949, in the neighborhood of Brás (São Paulo), with over 2000 students at the time. He was also a teacher and headmaster at Instituto de Educação Castelo Branco (Castelo Branco Institute of Education) in Limeira, São Paulo, from 1949 to 1966.

He, then, pursued an advanced academic degree, obtaining a masters at the University of Louisiana, USA, in 1950. As he returned to Brazil, he was invited by Professor Noemy Rudolfer to be her assistant at the Department of Psychology of USP (Saviani, 2005).

In 1953, he obtained a doctoral degree at the Faculty of Philosophy, Languages and Human Sciences of USP, with a dissertation on Experimental Psychology. In 1954, Joel returned to the USA to attend a postdoctoral internship at University of Michigan.

In 1956, he was invited by Fernando de Azevedo to join the Educational Studies and Research Department of Centro Regional de Pesquisas Educacionais (Regional Education Research Center) (CRPE/SP) to work as a director, position he maintained until 1957, when he became Director of the *Diretor da Divisão de Aperfeiçoamento do Magistério* (Department of Primary Teaching and Learning Improvement) (DAM).

In 1959, he was invited to work for the Organization of American States (OAS) supervising educational programs across Latin America, which provided him with a thorough perspective of our continent, its differences, and profound disparities.

Due to his experience at the OAS, Joel was invited to join UNESCO in Paris, 1960–1962, where he worked in projects for the most impoverished populations in Africa.

As he returned from Paris, Joel Martins started his career at the Pontifícia Universidade Católica de São Paulo (Pontifical Catholic University of São Paulo) (PUC-SP) as a Professor of Psychology. Given some time, he was involved in two major projects: the University Reform and the implementation of the postgraduation area. Being nominated a member of the Commission in charge of the University Reform in 1967 (Nagamine, 1997, p. 66), one of his main concerns was: “to create a basic cycle that allowed recently graduated High-School students to be welcomed to the university, and to take part in the great matters of contemporaneity through the study of Philosophy, Sociology, Anthropology and Psychology” (Ronca & Luna, 2017, p.15).

Assigned the specific mission to design and implement the postgraduation area to be

articulated to both the basic and the professional cycles, Joel created, in 1969, the first Psychology of Education postgraduation program of Brazil at PUC-SP.

He also collaborated with the creation of other postgraduation programs at the university, such as Communication and Semiotics, and Applied Linguistics and Language Studies in 1970, and, in 1971, Philosophy of Education.

A new phase of making Psychology of Education researchers and teachers started, in which he coordinated the recently created Psychology of Education program, lectured at least one course per semester – usually in Human Learning – and oriented research, thesis, and dissertations, while he also took the position of President at the Postgraduation General Commission at PUC-SP.

His doctorate at USP was based on behaviorism, by studying Clark Leonard Hull (1884–1952) and Edward Chace Tolman (1886–1959). In the 1970s, he concentrated on investigating cognitivism with David Paul Ausubel (1918–2008), who he brought to Brazil to give courses and discuss research. In the 1980s, he intensively dwelled with phenomenology, mainly via Martin Heidegger (1889–1976) and Maurice Merleau-Ponty (1908–1961). His uneasiness led him to make constant epistemological ruptures by questioning fundamentals of certain theories.

In his pursuit to contributing with teachers' and researches' education, his most compelling priority was to send students to study abroad. With vast international experience, he sought partnership with Ford Foundation, Fulbright Commission, and the *Coordenação de Aperfeiçoamento de Pessoal de Nível Superior* (Coordination of Superior Level Staff Improvement) (Capes) so that Brazilian students could study in the USA and Europe.

In 1992, he was elected Dean at PUC-SP. He took office on 28 November, unfortunately, for 5 months only. He passed on in May 1993. Joel Martins became one of the most significant names of Brazilian postgraduation scene. He was a professor and a trainer of hundreds of masters and doctors. He valued qualitative research, qualitative phenomenological in special. In his life and his work, he highlighted the intellectual emancipation of people, taking a stand in favor of research, science, and schools.

Masotta, Oscar Abelardo

Born *Buenos Aires, (Argentina), 8 January 1930*

Died *Barcelona, (Spain), 13 September 1979*

Hernán Scholten

Universidad de Buenos Aires, Buenos Aires, Argentina

Keywords

Argentina · Spain · Psychoanalysis · Lacanism · Freudian School of Buenos Aires

Oscar Masotta finished his high school studies at Escuela Normal (Normal School for Teachers) N° 4 “Mariano Acosta” in Buenos Aires in 1947. Although he followed some courses on the Philosophy Program at the University of Buenos Aires in the mid-1950s, he did not obtain any university degree.

During the 1950s, he wrote articles for several local magazines on literary criticism, politics, and philosophy such as *Centro (Center)*, *Clase Obrera (Working class)*, and *Contorno (Contour)*. His first publications were inspired by French literature, especially the existentialism of Jean-Paul Sartre (1905–1980) (Scholten, 2001; Terán, 2013). His first references to Freudian doctrine date from this period (Masotta, 1959), from his readings of *La Psychanalyse*, a journal published by the French Society of Psychoanalysis led by Daniel Lagache (1903–1972) and Jacques Lacan (1901–1980). Already in 1964 he presented Lacan’s ideas for the first time to the local public at the Instituto de Psiquiatria Social [Institute of Social Psychiatry], at the request of its director, the psychiatrist-psychanalyst Enrique Pichon-Riviere (1907–1977) (Borinsky, 2000).

His fourth book, *Conciencia y estructura (Consciousness and Structure)* (1969), compiled a large part of his previous publications and reflected the wide range of topics, inspirations, and theoretical tensions that permeated his writings in the 1950s and 1960s, and also showed his growing interest in psychoanalysis.

By this time, he had organized his first *study groups* on the work of Jacques Lacan, whose contributions were still largely unknown outside France. They gave rise to the first informal “Lacanian Congresses,” meetings of an informal nature.

His controversy on the dream interpretation technique with Emilio Rodrigué (1923–2008), a prominent member in the local psychoanalytic establishment, even though Rodrigué himself would move away from the Argentine psychoanalytic orthodoxy, demonstrated his definitive turn toward Freudian studies, with a clearly lacanian stamp (Masotta, 1970, 1971; Rodrigué, 1969).

At around this time, as director of various collections at the Argentine publishing house Nueva Visión, he highlighted the contributions

of outstanding figures of French psychoanalysis and published the first volumes in Spanish dedicated to the work of Jacques Lacan (1970).

Additionally, in 1971 he took over the direction of the *Cuadernos Sigmund Freud (Journal Sigmund Freud)*, a periodical publication that aimed to reinvigorate the study and research of Freudian work. In its pages were published some events in whose organization Masotta took an active part. For instance, the visit to Buenos Aires of Maud Mannoni (1923–1998) and Octave Mannoni (1899–1989), both members of the École Freudienne de Paris, the first lacanians to visit Argentina in 1972, and the Jornadas Sigmund Freud promoted by the Goethe Institut from Buenos Aires in October 1973.

Those events served as a precedent for the creation in 1974 of the Escuela Freudiana de Buenos Aires (EFBA, Freudian School of Buenos Aires), which introduced itself as an alternative space to the Asociación Psicoanalítica Argentina [Argentine Psychoanalytical Association], the local representative of the International Psychoanalytical Association that had monopolized the training of psychoanalysts until that moment. The founding act was signed by its 19 initial members, mostly young professionals, and characterized the EFBA as an institute of psychoanalytic research that proposed a 3-year program of seminars on diverse topics (nosography, clinical practice, epistemology, etc.).

At the end of that year, due to the volatile local political situation, Masotta emigrated to Europe and, after a brief stay in London, he settled in Barcelona. There, he dedicated himself to the dissemination of psychoanalysis, which at that time was not very widespread in Spain. He formed study groups, taught courses, and founded institutions such as the Biblioteca Freudiana de Barcelona [Freudian Library of Barcelona] and the Biblioteca Gallega de Estudios Freudianos [Galician Library of Freudian Studies] (Druet, 2017).

In 1975, Masotta introduced the EFBA, which he continued to direct from Europe, to Lacan himself, and he was admitted as a member (psychoanalyst practitioner) at the École Freudienne de Paris (Freudian School of Paris) (Masotta, 1976).

Soon after, tensions within the EFBA began to escalate, especially as a result of the controversies over the implementation of hierarchies in the institution. Toward the middle of 1979, a few months before his death, a split emerged that led to the foundation of the Escuela Freudiana de la Argentina [EFBA, Freudian School of Argentina] under the direction of Masotta.

Oscar Masotta was a key figure in the diffusion of psychoanalysis in its *lacanian version* in Argentina and Spain during the 1970s. Through his teaching, publications, and institutional initiatives, he propagated a novel interpretation of Freudian work, whose impact is still appreciable in the teaching of psychoanalysis and in the professional training of psychoanalytical psychologists in Argentina.

Matlin, Norman

Born *on 1929 at Hudson City, NJ, USA*

Died *on 2007 at Hartford, CT, USA*

Miguel A. Arrieta Morales
Institute of Human Potential, San Juan, Puerto Rico

Keywords

Puerto Rico · USA · Graduate Programs in Psychology · Models for Psychotherapy · Ethics

Norman Matlin was born to Israel and Edith Matlin, a family from New Jersey and New York who practiced the Jewish religion. Norman Matlin had a son from a first-marriage with whom he maintained a close relationship and frequent communication. His second wife Anna was an inseparable companion who supported him in his

personal and professional life; they were married for nearly three decades.

After World War II, circa 1955, the new government of Israel invited all Jews in the diaspora to return to repopulate the newly created nation. Norman Matlin accepted the invitation and moved to Israel, where he lived and worked as school counselor for 2 years. During his time in Israel, he learned to speak Hebrew, which he added to other languages he already spoke: English, Spanish, French and Latin.

When Norman Matlin returned from Israel, and motivated by his experiences there, he entered The New School for Social Research at New York City to pursue graduate studies in General Sociology. He obtained a PhD in 1963 with his dissertation, *A heuristic model for education*.

Once Norman Matlin obtained his doctoral degree, he was invited to work at the University of Puerto Rico, Río Piedras campus (UPR-RP), and he moved to San Juan, PR. He taught courses in Sociology, Psychology, and Statistics at the Faculty of Social Sciences. He also worked as a researcher at the School of Public Health Of UPR-Medical Sciences. During the mid-1960s, Dr. Norman Matlin shared with Dr. Carlos Albizu-Miranda a concern about the way Psychology was taught in Puerto Rico and about the need to create graduate studies in Psychology at UPR-RP. He understood that the theoretical models used in Puerto Rico did not take into account the cultural idiosyncrasy and character of the Puerto Rican people. Dr. Albizu-Miranda and Dr. Matlin dedicated great efforts toward the creation of a private graduate school of Psychology, named the Psychological Institute of Puerto Rico. This graduate school would provide students with a theoretical background that took into consideration the Puerto Rican culture. This Institute was founded in 1966, but in 1974 was renamed as Caribbean Center for Post Graduate Studies, and today is Carlos Albizu University, with campuses in San Juan and Mayagüez, PR and Miami, Florida in the United States of America.

In early 1970s, Norman Matlin had a disagreement, with Carlos Albizu-Miranda and the administration of this graduate school, about policies and models of understanding and visualizing the field

of Psychology. He decided to leave and use his experience and ideas to initiate another graduate school in Psychology. In 1975, a group of educators from the Caribbean Center of Post Graduate Studies joined Dr. Matlin in creating The Faculty of Applied Social Sciences, in Cayey, PR (Boulon & Roca de Torres, 2016). This graduate school offered a Master's Program in Clinical Psychology. This new school based its curriculum of studies on discussions of humanity from the perspective of *Ethics of Respect*, critical analysis, and the decision-making process. The School was closed in 1984 (Rivera Alicea, 2011) and held about five graduation ceremonies, where several groups of students graduated with a master's degree.

In the mid-1980s, Dr. Francisco Domingo, Dean of the Faculty of Humanities at Central University of Bayamón, PR, asked Dr. Matlin to create a master's degree program based on decisional models. In 1991, the first graduation of students who completed the Master's in Decision Analysis was held. Two more graduation ceremonies (1993, 1995) were conducted before this program was discontinued. The program was later transformed into a master's degree program in Organizational Psychology, that is still offered at this University (J. Santiago, personal communication, October 24, 2020).

Early in the decade of 1980, Norman Matlin published his emblematic article: *What is wrong with psychology?* (1983b). In it, he describes the meaning of the concept he called Ethics of Respect in the development and implementation of Helping Models. The importance of Ethics of Respect was present in all his initiatives; it justified the creation of his theories and the graduate schools he established. Its principles guided him from his career at UPR-RP, to the Puerto Rican Institute of Psychology, The Faculty of Applied Social Sciences, to the School of Decision Analysis. Within this last endeavor, he gathered the mature fruits of his reflections.

Dr. Matlin's teaching method was Dialogic, as he called it, a "give and take," where the questioning and logical rigor prevailed. In the healing process he practiced from the perspective of art and science, and the process consisted of raising the right questions for the analysis, geared to solving problems and decision-making, according to the client's

values and goals, not by the definitions and values of the consultant, counselor, or therapist. While applying the rules of logic, its strengths included the use of reasoning with the client.

As a teacher, Norman Matlin's influence was present in the creation of graduate programs of Psychology, and also in mentoring former students who today are active in the education of future psychologists. His impact is also felt in over 21 books and articles published during his lifetime. He wrote about a variety of subjects: statistics, goal therapy, therapy of reality, decision-making, research, crises strategies, meditation, logic, individual consultation, counseling, group dynamics, and critical philosophy.

The essential paradigm of Dr. Matlin's thought is Ethics of Respect: respect for the personal values of the client. He developed the Goal Therapy model, where the goals of therapy are defined according to the personal needs and context of the person. He adapted to Puerto Rican culture the model of Reality Therapy developed in 1965 by William Glasser (1925–2013) and also Albert Ellis (1913–2007) model of Rational-Emotive Therapy (1962).

Norman Matlin and his wife Anna lived in Puerto Rico until 2005, when his wife had a stroke and they moved to Hartford, CT, to live with his wife's daughter. Both died in 2007.

Matos, Maria Amélia

Born on *April 14th, 1939, in Birigui, a city in the state of São Paulo, Brazil*

Died on *May 17th, 2005, in São Paulo, Brazil*

Rodrigo Lopes Miranda¹ and Sérgio Dias Cirino²

¹Universidade Católica Dom Bosco, Campo Grande, Brazil

²Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

Keywords

Brazil · Experimental Psychology · Experimental analysis of behavior

Born in a countryside town in the state of São Paulo, Maria Amélia moved to the state's capital in 1957. She was admitted to the first class of psychology degree at the *Universidade de São Paulo* – USP (University of São Paulo), in 1958. In her last year as an undergraduate student, in 1961, she met Fred Keller (1899–1996) when he came to Brazil, for his Sabbatical year at USP. In this meeting, Maria Amélia became his assistant at the Behavior Analysis' laboratory and she was one of the pioneers in institutionalization of this theory in Brazil. The group was composed by Carolina Martuscelli Bori (1924–2004), Dora Selma Fix Ventura (1939), Isaias Pessotti (1939–), Rodolpho Azzi (1927–1993), among others.

In 1962, she left to the United States (USA) to do her graduate studies. She did her master's degree under supervision of Keller at Columbia University, in New York from 1962 to 1964, and in 1969, she completed her PhD for the same University. In Phd, she was supervised by William Nathan Schoenfeld (1915–1996), Keller's collaborator on the first Behavior Analysis' laboratory for Psychology teaching. As a complement, Maria Amélia was assistant in the Psychophysiology laboratory at Veterans Administration Hospital during her graduate studies, and she taught Psychology introductory courses and Experimental Psychology at Columbia University.

Maria Amélia returned to Brazil in 1969, during the military dictatorship and Brazilian University Reform. “Miss Matos,” as she was affectionately called by her students, started her teaching activities at USP's Psychology Institute in 1970. She contributed to the institutionalization of pioneer's lines of investigation including aversive controls, conditional discrimination and equivalence relations, recombinative reading, and rule-governed behavior. Maria Amélia made Experimental researches and published materials for didactic teaching to researchers.

She supervision 32 masters and 38 doctoral students. In the articulation between research and guidance, for example, it is possible to cite the book “Teaching about observation: An introduction,” derived from Marilda Fernandes Danna's masters research under Matos the guidance (Danna & Matos, 1982). The oeuvre was reissued in 2000,

under the title “Learning to observe” with updates that continued allowing the practical teaching of behavioral observation in Psychology from the selection of human participants (Danna & Matos, 2011).

Maria Amélia had her participation highlighted in scientific institutionalization Psychology in general and, specifically, of Behavior Analysis, in Brazil. She cooperated for the establishment and consolidation of associations, for example, *Associação Brasileira de Psicologia e Medicina Comportamental* – ABPMC (Brazilian Association of Behavioral Psychology and Medicine), in 1991, and *Sociedade Brasileira de Psicologia* – SBP (Brazilian Society of Psychology), in 1971. Maria Amélia was secretary of the SBP on two occasions, in 1991 and between 1991 and 1993, when the society was called the *Sociedade de Psicologia de Ribeirão Preto* – SPRP (Psychological Society of Ribeirão Preto). Moreover, she contributed to the strengthening of different scientific journals, for example, the *Cadernos de Análise do Comportamento* (1981–1985) and the *Revista Brasileira de Terapia Comportamental e Cognitiva* (1999 – onward). About the Behavior Analysis, she contributed to circulation and appropriation of proposals of Interbehaviorism of Jacob R. Kantor (1888–1984) in Latin America (Matos, 1981). In this sense, communicating with the author, Matos (1982) showed that her interest was related to works “Outline of Social Psychology” (Kantor, 1929) and “Psychological Linguistics” (Kantor, 1977). These interests seem to coincide with the Matos productions, involving verbal behavior, in addition to be part of *Zeitgeist* of Brazilians interested in verbal behavior relations, Social Psychology, and Behavior Analysis (cf. Sá, 1986).

Maria Amélia had interest in the Psychology Science consolidation in Brazil. She published many research mapping and analyzing scientific production in Psychology on the different societies, like *Conselho Federal de Psicologia* – CFP (Federal Council of Psychology) (Matos, 1988) and the *Associação Nacional de Pesquisa e Pós-graduação em Psicologia* – ANPEPP (National Association of Research and Postgraduate Studies in Psychology) (Matos, 1993). She has critical thinking about Psychology academic training in

Brazil in the 1980s: “[such training is] practically restricted to some laboratory exercises in the Experimental Psychology disciplines and some information on logic and statistics in the Methodology disciplines (these, if any)” (Matos, 1988, p. 100).

Matos’ trajectory exemplifies the participation of Brazilian women in elaboration of Psychology as a Science and Profession, especially in Behavior Analysis in Brazil. She contributed to the institutionalization Psychology Associations (e.g., SPRP) and Behavior Analysis (e.g., ABPMC), that phenomenon strengthens research in Psychology in Brazil. In fact, her research activities imprinted strong marks at USP – where she taught – and in the scientific community in which circulated. Researches about aversive controls, such as stimulus equivalence and reading practice, are themes in different universities where her ex-students continue her studies, e.g., *Universidade Federal do Pará* – UFPA (Federal University of Pará), *Universidade Federal de São Carlos* – UFSCar (Federal University of São Carlos), among others. Therefore, her contributions didn’t stop in her life, her legacy continues.

Psychoanalytic Association · Bilogic

Ignacio Matte Blanco was one of the main responsible for the institutionalization of psychoanalysis in Chile and can be considered the most influential Chilean psychoanalyst worldwide, being his works from the 1970s the greatest expression of this (Arrué, 1991; Rupertthuz, 2015). His school years took place at *Liceo Alemán de Santiago* (Santiago's German Highschool), after which he studied medicine and trained as a physician at *Universidad de Chile* (University of Chile), obtaining his degree in 1930 (Rupertthuz, 2015). There he met Luciana Bon Guzmán, with whom he married and formed a family, having seven children together (Escobar, 2016).

In 1931, Matte Blanco was in charge of the Physiology chair at *Pontificia Universidad Católica de Chile's* (Catholic University of Chile) Medical School. Subsequently, after being psychoanalyzed by Fernando Allende Navarro, another key figure in the origins of the Chilean psychoanalytic movement, he moved to London in 1934 to continue his studies in physiology. During his 6 years in England, he trained in neuropsychiatry at the Northumberland House and the Maudley Hospital, becoming increasingly involved in the field of psychology. In those years, he received his training as a psychoanalyst at the British Institute of Psychoanalysis, being Walter Schmideberg his didactic analyst (Whiting, 1980). In the British Society of Psychoanalysis, of which he became a member (1938), he linked up with Melitta Schmideberg, James Strachey, Ella Sharpe, Melanie Klein, Ernest Jones, Edward Glover, Adrian and Karin Stephen, Anna Freud, John Rickman, and Helen Sherhan-Dare. This period marked a shift from his previous work towards psychoanalytic practice as his main activity. Matte Blanco was inserted in the quintessential psychoanalytic environment of those years and even had a direct epistolary exchange with Freud himself. In 1940, Matte Blanco headed to the United States, entering the John Hopkins University (Baltimore) and the Duke University (North Carolina), where he developed training, clinical and teaching activities under the supervision of neurologist Richard S. Lyman. This time was marked by an effort to systematize his psychoanalytic theories (Arrué, 1991; Jordan-Moore, 1995; Ojeda, 2001; Rupertthuz, 2015).

Once having returned to Chile in 1943–1934, Matte Blanco found a place in the academic world, obtaining a position in the Chair of Psychiatry at the Faculty of Medicine of *Universidad de Chile* (University of Chile). At the *Manicomio Nacional* (National Asylum), and after a public contest, Matte Blanco became director (Associate Professor) of the Psychiatry Chair in 1949. In addition to the above, and in parallel, he explosively developed his psychotherapeutic practice. In this context, he surrounded himself with a team of collaborators with whom he organized the *Grupo de Estudios Psicoanalíticos* (Psychoanalytic Study Group) in his own house, which was also open to other nonmedical professionals. Then, Matte Blanco assumed the commitment that this group be granted the rank of Psychoanalytic Association, which took place that same year, during the Zurich Congress, presided by Ernest Jones himself, creating the *Asociación Psicoanalítica Chilena* (Chilean Psychoanalytic Association). This fact gave rise to an institutionalized process of training psychoanalysts according to the official standards of the International Psychoanalytical Association (Arrué, 1991; Escobar, 2016; Ojeda, 2001; Ruperthuz, 2015). In this way, Matte Blanco is considered one of the main precursors of psychoanalysis as a scientific movement in Chile, particularly because of his links with the academic and psychiatric-hospitalary world, consolidating the triadic relationship between psychoanalysis, psychiatry, and academia; Matte Blanco was therefore a fluent psychoanalyst, psychiatrist, and academic (Arrué, 1991).

In 1966, after teaching psychiatry for 18 years, Matte Blanco resigned from his position and moved with his family to Italy. There, he continued to teach as a Professor of Psychiatry at the Faculty of Medicine of the *Università Cattolica del Sacro Cuore* (Catholic University of Sacred Heart) in Rome, carrying out his psychoanalytic activity both as a clinical psychoanalyst and a didactic analyst, culminating his own research with the publication of his latest works, which brought him international prestige. Matte Blanco wrote four books and more than 50 scientific papers (Escobar, 2016; Fink, 1997).

Matte Blanco's theoretical proposal is characterized by the incessant effort to formalize the psychoanalytic postulates, endowing them with an eminent sense of rigor and scientificity. Proof of this was his interest in looking at psychoanalysis from the points of view of logic and mathematics. In England, he had studied Bertrand Russell, and later, in New York, he deepened his mathematical studies, attending Professor Courand's weekly mathematics seminar at Columbia University (Florenzano, 2009). One of his main contributions to the general psychoanalytic field and to psychiatry is related to his concept of "bilogic," where he proposes that mental activity should be understood in the light of two principles: asymmetry (typical of the consciousness' processes), which generates distinctions and hierarchies, and symmetry (typical of the unconscious' processes), which treats everything equally and as belonging to the same class (Matte Blanco, 1975).

José Joaquim de Campos da Costa de Medeiros was the son of Joaquim José de Campos da Costa de Medeiros and Maria Carolina Ribeiro de Medeiros and the elder brother of Maurício de Medeiros. He was a journalist, teacher, politician, writer, speaker, essayist, and memoirist.

His studies began with his mother, who taught his primary education, enabling him to enter the Ginásio Nacional (National Gymnasium). At the age of 13, in 1880, he traveled with his father to Portugal, where he studied at Escola Acadêmica de Lisboa (Lisbon Academic School) until 1884. Returning to Rio de Janeiro, he studied Natural History with Emílio Goeldi (1857–1917) and was tutored by Silvio Romero.

He was one of the founders of Academia Brasileira de Letras (Brazilian Academy of Literature – ABL); due to his interest in simplifying writing, he was responsible for the first orthographic reform of the Portuguese language carried out in Brazil, promoted by the Academy in 1902. Occupying chair number 22, he was the head of the general secretariat between 1899 and 1917, integrated the Dictionary Committee and was the editor of the institution's Journal.

An active participant in the Republican movement, he was sympathetic to abolitionism and authored the lyrics of the Anthem of the Brazilian Federative Republic, a fact that favored his appointment in 1892 by the Minister of Public Education, Benjamin Constant (1836–1891), as Vice-Dean of the National Gymnasium, later known as Colégio D. Pedro II (Peter II School).

His political life started in 1894 as a federal representative of Pernambuco for three terms (1894–1896, 1901–1902, and 1904–1911). During his first term, he worked on the defense of the copyrights act. He defended when Brazil joined the First World War. Due to his stance against the government of Prudente de Moraes (1894–1898), he sought refuge at the Embassy of Chile; supporter of Washington Luís (1926–1930), he exiled the Embassy of Peru when Getúlio Vargas won the elections during what was called the Revolution of 1930.

In his contributions to the journalistic field, he signed his texts with different pseudonyms, having collaborated with several journals, such as: Fígaro, O Tempo, A Notícia, A República, O País, Revista da Semana, Gazeta de Notícias, A Ilustração, and A Noite e Gazeta de São Paulo.

In the field of psychology, he contributed with Pedagogium, a Pedagogical Museum, which he transformed into a cultural center and created the

first laboratory of experimental psychology of the country in this location. The laboratory was designed by Alfred Binet (1857–1911) and directed, invited by Medeiros e Albuquerque, by Manoel Bomfim. He was interested in hypnotism, having published a book about it with several editions by different publishing houses. However, his main contribution to psychology was his book about the use of pedagogical and psychological tests, the first work on the topic in the country, which had a unique role in the dissemination and use of this tool on the topic in the country. Isaías Alves, one of the most important names in psychological evaluation, states in his book that, reading Medeiros e Albuquerque's book made him interested in the use of psychological tests (Alves, 1930).

Ethel Bauzer Medeiros is a Brazilian psychologist and educator. Her parents, Samuel Bauzer and Maria Coppola Bauzer, immigrated from Italy to Brazil due to the First World War (Lima, 2009). Ethel was born after the family was definitely settled in Rio de Janeiro, the federal capital at the time.

In this same city, between the years 1932 and 1942, she did the *Curso Normal*, at the *Instituto de Educação* (Institute of Education), a school designed to train teachers to work in education. Part of this training included the practice of teaching in the suburbs of Rio de Janeiro (Lima, 2009; Amaral & Nunes Junior, 2011), where she started her career as a teacher in 1942.

In 1946, she entered a public contest to become an education technician for the Ministry of Education and Health, with approval for the area of professional guidance and selection, in the field of psychological measures and evaluation. She took office in 1947. She was in charge of developing, defining, and evaluating the tools, methodologies, and practices to be used in education in its different levels. She became close to Anísio Spínola Teixeira and Manuel Bergström Lourenço Filho, who were essential for the consolidation of the educational policies based on the *Movimento*

Escola Nova (New School Movement), during the governments of Getúlio Vargas (1882–1954), which occurred between 1930 and 1945, and from 1951 to 1954.

The *Escola Nova* program fostered the development of autonomy, in which recreation, including its ludic aspect, was considered a tool for the moral formation of a person and for the social development, especially in the historical scenario in which Brazil was undergoing changes due to the processes of urbanization and industrialization components of the beginning of the twentieth century. This bias, focused on the development of people inserted in a given culture, permeated Ethel's professional path, setting up her practice in education and psychology.

She took the master's degree in education at the Northwestern University, Illinois, the USA, in the area of measures in education and psychology. In 1949, she was granted the degree of master of arts in correlated areas of education and psychology (Lima, 2009; Amaral & Nunes Junior, 2011). Upon returning from the USA, she resumed her studies to obtain a teaching license degree in pedagogy at the National Faculty of Philosophy of the University of Brazil, currently the Federal University of Rio de Janeiro, concluding this stage of her education in 1951.

As reported in an autobiographical mode to Lima (2009), Anísio Teixeira entrusted her with the task to develop a recreation manual to be used at elementary schools complying with the features of the educational policies prevailing in 1954. After extensive bibliographic research surveying areas such as social anthropology and historiography, carried out between 1954 and 1959, the work *Jogos para recreação na escola primária* (*Games for Recreation at Elementary School*) was completed (Medeiros, 1959). In this work Ethel systematizes recreation practices, playful activities and games, as well as their planning and execution in organizations. The publication became a reference in the area of education, bringing various elements of developmental psychology, issued in other Latin American countries in the following decade.

Ethel's understanding of leisure, as the space of time not compromised with the obligations of life

and work (Medeiros, 1971), is that such a phenomenon constitutes a basic human need (Amaral & Nunes Junior, 2011), linked to individual development and in relation to collective historical and cultural processes.

Medeiros' work refers to the concept of leisure – a term derived from the Latin *licere*, related to what is allowed, to what is lawful – as a person's inherent characteristic (Medeiros, 1971), involving ludic and social aspects, in a view that is opposed to the understanding of this concept as a product from industrial society.

Thus, she was one of the first Brazilian authors to systematize this theme as an important factor for full development, as well as to deal with its relations with psychology, culture, and recreation, inserting these elements in public policies and in the planning of training actions.

In the early 1970s, she published the book *O Lazer no Planejamento Urbano* (*Leisure in Urban Planning*) (Medeiros, 1971) with the support of the Ford Foundation in partnership with the Getúlio Vargas Foundation, in which she develops dialogues between different areas such as psychology, urbanism, free time, and recreation. In the same decade (Medeiros, 1975) she published other works that dealt with the relationship between the fields of culture and psychology with the theme of leisure.

She participated as a cofounder of the World Leisure and Recreation Association (WLRA), in the USA (USA), in 1976, which came to be the expansion of the scope of the previous International Recreation Association (IRA), created in 1956 in Philadelphia (USA) also with her participation. In the 1980s she participated in the planning of public policies and in the development of organizations such as the Asociación Latinoamericana de Tiempo Libre y Recreación (ALATIR), which had its first headquarters in Santiago, Chile, in 1981.

Among her production in the field of psychology are works that date back to the 1960s and 1970s of the twentieth century, approaching the fields of measurements and evaluations (Medeiros, 1976). In the 1980s and 1990s she worked as a consultant and lecturer in the field of organizational psychology. In 1999 she

published *Medidas psico & lógicas: introdução à psicometria* (*Psycho and logical measures: introduction to psychometry*), which describes methods and techniques for the construction and use of instruments. From the 1970s to the 1990s, she worked for the Getúlio Vargas Foundation, in Rio de Janeiro, specifically in the areas of organizational and educational psychology.

In her professional career Ethel defined concepts and developed practices that enhanced the integration between psychology and other areas of knowledge, such as leisure, free time, work, and education.

Maurício Medeiros was a psychiatric physician with multidisciplinary works in the areas of Psychiatry, Psychology, and Education, at a time when the “psy knowledge” was generally present in different disciplines.

He was son to Joaquim José de Campos da Costa de Medeiros, an advisor to the Empire, and Maria Carolina Ribeiro de Medeiros, widow of the caricaturist Henrique Fleuiss (1824–1882). After his father’s death, he was under the supervision of his brother, José Joaquim Medeiros e

Albuquerque, a prominent character in letters and politics.

He attended basic education at the Ginásio Nacional (National School), now Colégio Pedro II (Pedro II School). He graduated in Pharmacy from the Faculdade de Medicina do Rio de Janeiro (Medical School of Rio de Janeiro) in 1903. His dissertation thesis, defended in 1907, was on “Methods in Psychology.”

Still in 1906, Maurício began his trajectory as a psychiatrist by being approved first as an intern at the Hospital Nacional de Alienados (National Hospice for the Insane, HNA), directed by Juliano Moreira. After the defense of his thesis, he was invited by Dr. Moreira to create the Gabinete de Psicologia Experimental (Office of Experimental Psychology) at the Pavilhão de Observação (Observation Pavilion) of the HNA. This Office, founded in 1907, is considered the second laboratory of experimental psychology in Brazil, the first having been created by Manoel Bomfim. Still in 1907, he went to Europe to improve his skills. He took a course with George Dumas (1866–1946), establishing himself at the Sainte-Anne asylum laboratory. He also took courses in Munich and maintained contact with Emil Kraepelin (1856–1926), referred by Dr. Moreira (Muñoz 2018).

Returning to Brazil, he continued to work at the Gabinete de Psicologia Experimental (Office of Experimental Psychology). He was approved in the selection process for associate professor of the Physiology Chair at the Medical School in 1912. Two years later, he participated in other selection processes and became professor of the psychology chairs at the Escola Normal do Distrito Federal (Normal School of the Federal District), now Instituto de Educação (Institute of Education), and of Patologia Geral da Faculdade de Medicina do Rio de Janeiro (General Pathology at the Medical School of Rio de Janeiro). One year after becoming an associate professor, he was appointed chief hygiene officer in the state of Rio de Janeiro and, in 1917, he became professor of General and Comparative Pathology at the Escola Superior de Agricultura e Medicina Veterinária (Higher School of Agriculture and Veterinary Medicine) (Calicchio 2010).

At the Medical School, he was also the director of the Institute of Psychiatry (IPUB), which replaced the former Observation Pavilion of the Universidade do Brasil (University of Brazil), now the Universidade Federal do Rio de Janeiro (Federal University of Rio de Janeiro – UFRJ), from 1946 to 1955.

After his graduation, under the influence of his older brother, Medeiros replaced him as the writer of the daily column in the newspaper *Gazeta de Notícias*, thus starting his career in journalism, which was marked by his activism. In the following years, he collaborated with other newspapers, such as *Correio Paulistano*; *A Notícia*; *Correio da Manhã*; *A Época* and *O Globo*. His journalistic experiences associated to medicine led him to become editor-in-chief of *Diário de Medicina* in 1924.

Besides his academic and clinical activities, Maurício de Medeiros had an active role in politics while occupying the position of federal representative and even Minister of Health. He was elected for the state Chamber of Representatives of Rio de Janeiro, representing the Republican Party (1916–1920) and, after leaving the Chamber, he returned in the following year elected as federal representative by the state of Rio de Janeiro. In 1922, he left his new term after he was approved at the selection process of School of Medicine of Rio de Janeiro, returning to the political scenario only in 1927, when he was elected federal representative again by the state of Rio de Janeiro during the administration of Washington Luís (1869–1957, term 1926–1930). After his reelection in 1930, he had his term interrupted due to the revolution that impeached Washington Luís, which led to the formation of the Government ruled by Getúlio Vargas (1882–1954, term 1930–1945).

Supporter of the Communist Party, he criticized the directions adopted by the Revolution of 1930 that was designed to eliminate the agricultural oligarchies and instruct a legitimate republican regime but became progressively conservative. Thus, even further away from politics, Medeiros ended up being affected, in 1935, by the repressive measures of the Vargas Administration,

being arrested and dismissed from the chairs of the National School of Medicine and the Higher School of Agriculture and Veterinary Medicine, charged for taking part in subversive activities. After that, he dedicated his time to the clinical activity in his psychiatric office.

However, his participation in the political realm was not over yet. During the administration of President Nereu Ramos (1888–1958, term 1955–1956), Maurício de Medeiros was nominated Minister of Health in 1955, and he was maintained in this position by President Juscelino Kubitschek (1902–1976, term 1956–1961) until 1958. In his term as Minister, he provided grants for the psychiatric physicians interested in obtaining their psychoanalysis degree in Argentina and England.

He was one of the introducers of Psychoanalysis in higher education, having invited Danilo Perestrelo to teach courses at IPUB and Alzira Perestrelo to organize the Clínica de Orientação Infantil (Clinic of Children's Orientation) created there. His interest in childhood issues was also showcased in his books.

His professional activity and multidisciplinary work in this period assisted the institutionalization of psychology in the area of mental health, in a moment when the main target was education-focused psychology.

Mejía-Ricart, Tirso

Born *Santo Domingo, (Dominican Republic), 16 June 1936*

Josefina Záiter

Universidad Autónoma de Santo Domingo, Santo Domingo, Dominican Republic

Keywords

Dominican Republic · Dominican psychology · Psychology training · Social psychology

The academic and professional work of Tirso Mejía-Ricart has great importance for the development of psychology in the Dominican Republic. He is the founder of the first Department of Psychology at the Universidad Autónoma

de Santo Domingo (Autonomous University of Santo Domingo, UASD) in 1967. He designed the career of psychology at this university and developed the first study plan for the degree in psychology. His academic training has an integration of broad interdisciplinary, in health sciences and social sciences. He studied medicine at UASD (1954–1958); in parallel with medical studies, he studied philosophy and letters. His studies in psychiatry and psychology were carried out at Boon University, Germany, 1961–1965.

His interest in psychology studies is evident when he participated in the First Inter-American Psychology Congress, organized by the Inter-American Psychological Society (SIP), which was held in 1953, in Ciudad Trujillo (today the City of Santo Domingo). What it meant for Tirso Mejía-Ricart to have participated in this first psychology congress he refers to when he stated that: “For me, I attended the sessions of the First Inter-American Psychology Congress as a first-year medical student and since then I have dedicated myself to virtually devour the scarce psychology books that passed through the Dominican bookstores and libraries of classical and contemporary psychologists, and that since 1954 I took the courses of General Psychology, Abnormal Psychology and Applied Psychology as a parallel student of the Faculty of Philosophy and Letters” (Mejía-Ricart, 1998).

In 1957, he produced an essay entitled “Psychological Process of Violent Acts,” a pioneering publication of Dominican scientific psychology (Mejía-Ricart, 1998). With this, he received the “Doctor Báez” award from the Faculty of Medicine.

The beginning of professional studies in psychology, in the Dominican Republic, occurs within the framework of the University Reform, at the UASD, that took place in the 1960s, when significant changes were introduced at the University of Santo Domingo. The Renewal Movement places the university, the primacy of America, at the height of the proposals of the Manifiesto of Córdoba that was the basis of the University Reform of Córdoba. With the reform, teacher

and student participation is recognized and a new organization is given to the faculties. Tirso Mejía-Ricart was a leading figure in the Renewal Movement at the UASD. Professor Enerio Rodríguez highlights the following: “The Renewing Movement, as its promoters baptized it, deepened the process of democratization of higher education in the country, facilitating access to higher education for large groups of the population, opening new careers, in the humanistic and social areas as well as in the scientific and technological ones. . .” (Rodríguez Arias, 2009).

The first Department of Psychology in the Faculty of Humanities of the UASD was established in 1967, its first director being Tirso Mejía-Ricart.

His contributions to the advancement of psychology in Dominican society include his contributions to social psychology, carrying out teaching, research, and publication work.

Professor Tirso Mejía-Ricart also participated in the establishment and initiation of the first Master’s Degree in Community Psychology at the Autonomous University of Santo Domingo (1980).

His intellectual work in psychology has provided a wide bibliography in general psychology and social psychology, and many of his texts are used in the training of generations of Dominican psychologists.

From his activity, as a government official, he influences the design and promotion of social policies, in the municipalities and in the reform of the Dominican State. From 2000 to 2004, he chairs and directs the National Council for State Reform. Mejía-Ricart makes contributions to the integration of community psychology in municipalities. He created “. . . the General Directorate of Community Action of the National District City Council, in 1980, in this instance psychology actions were carried out, for which various psychologists were employed” (Mejía-Ricart, 1998). He has been designated as Historian of the City of Santo Domingo de Guzmán.

He is a Merit Professor at the Universidad Autónoma de Santo Domingo (UASD), and

member of the Academy of Sciences of the Dominican Republic.

Since his participation as Representative in the National Congress, he was a promoter of the law that establishes the Dominican College of Psychologists – CODOPSI in 2001. For his contributions to the constitution of the Dominican College of Psychologists (CODOPSI), he was granted in 2006 a Diploma of Recognition.

Ralfy Mendes de Oliveira went to primary school in Itaperuna and Laje do Muriaé, in the countryside of the state of Rio de Janeiro. From 1930 to 1934, he attended high school at the Instituto Comercial Campos dos Goytacazes (Commercial Institute of Campos dos Goytacazes), where he received technical training as an accountant. He started working in his hometown, later moving to Rio de Janeiro and Niteroi. Since then, he showed interest in popular music and became famous as a composer and singer of samba-canção. In Niteroi, he established contact with the Salesian Fathers of Colégio Santa Rosa (Santa Rosa High School), choosing to devote himself to educational activity and religious life. In 1936, he was sent to the introductory course for seminary education in Lavrinhas, in the interior of São Paulo, becoming a Salesian novice in 1940. Between 1941 and 1943, he graduated in Philosophy at the Faculdade Salesiana de Filosofia, Ciências e Letras (Salesian Faculty of Philosophy, Sciences and Letters), in Lorena, where he had his first contacts with Psychology. Due to the values of the Salesian

Congregation, he was sent to study Pedagogy at the Instituto Salesiano de Filosofia e Pedagogia (Salesian Institute of Philosophy and Pedagogy) in São João del-Rei, an opportunity in which he proposed the hypothesis that Music could be a means for promoting human development. Between 1947 and 1950, he studied Theology at the Instituto Teológico Pio XI (Pius XI Theological Institute), in São Paulo, being ordained a priest at the end of this period. He began his teaching career in São João del-Rei, teaching Philosophy and Psychology at the Instituto Salesiano de Filosofia e Pedagogia (Salesian Institute of Philosophy and Pedagogy) (1951-1952) and participating in the negotiations for the creation of the Faculdade Dom Bosco de Filosofia, Ciências e Letras (Don Bosco Faculty of Philosophy, Sciences and Letters) in the same city.

Ralfy Mendes de Oliveira's became involved in Psychology before the regulation of the profession of psychologist in Brazil, which took place in August 1962, when the science was predominantly spread through its presence in the training of other professionals, notably teachers (Antunes, 2012). He contributed to the transmission of psychological theories and practices between European and Brazilian institutes, since, between 1953 and 1955, he took a Master in Pedagogy, with an emphasis in Psychology, at the Istituto Superiore di Pedagogia (Higher Institute of Pedagogy) of the Pontificio Ateneo Salesiano (Salesian Pontifical Athenaeum), in Turin. There, he received training that was divided into fundamental disciplines, such as Experimental Psychology, Psychology of the Evolutionary Age and Differential Psychology, and those of an applied character to the resolution of educational problems, namely: Methodology of Mental Tests, Bio-Pedagogical Problems of Adolescents, Pedagogical Psychology and Curative Pedagogy. He also worked as an intern at the Laboratorio di Psicologia Sperimentale (Laboratory of Experimental Psychology), directed by Giacomo Lorenzini (1930-2001), and visited research centers in Italy, France, Spain and Portugal. To obtain the title, he presented the research "Diagnosi del talento musicale" (Diagnosis of musical talent), in

which he assessed the musical aptitude, understood as a result of the articulation between tonal quality, sense of consonance, volume, and rhythm, of children and adolescents of different ages and cultural origins through the application of the Seashore Test. Mendes de Oliveira (1954) concluded that developmental stages and individual intelligence patterns interfere in the establishment of musical aptitude. During this period, he participated in the acquisition of psychological equipment and works that made up the Laboratório de Psicologia Experimental (Laboratory of Experimental Psychology) and the library of the Faculdade Dom Bosco de Filosofia, Ciências e Letras (Don Bosco Faculty of Philosophy, Sciences and Letters), taking charge of their transfer from Genoa to the city in Minas Gerais (Batista, 2015).

Back in São João del-Rei, he set up the Laboratório de Psicologia Experimental (Laboratory of Experimental Psychology), becoming its first director (Bomfim & Albergaria, 2004). Then, he began to organize the teaching practices undertaken there, even delivering the inaugural class "Dificuldades da experimentação em Psicologia" (Difficulties of Experimentation in Psychology) (Servo, 1964). He taught Experimental Psychology, Differential Psychology and Psychology of the Evolutionary Age in the Philosophy and Psychology of the Evolutionary Age undergraduate course in Educational Guidance. He also created the Centro de Estudos Pedagógicos (Center for Pedagogical Studies) (1955), an entity that brought together local teachers to receive psychological and pedagogical training and debate contemporary educational problems, and the Serviço de Orientação Educacional e Profissional (Educational and Professional Guidance Service) (1957), which specialized in surveying the mental level and attention index, observation of school performance, analysis of intellectual factors and care for children and adolescents (Servo, 1964). Due to his training and performance, Mendes de Oliveira participated in debates with the government of the state of Guanabara about the presence of Religious Education in the curriculum, an

opportunity in which he argued for the importance of considering the student's integral characteristics. In his perspective, it would be up to this discipline to promote the student's moral development and adequately form their values for life in society.

He was transferred from Faculdade Dom Bosco de Filosofia, Ciências e Letras (Don Bosco Faculty of Philosophy, Sciences and Letters) to various Salesian institutions in Southeastern Brazil, when he began to devote himself predominantly to the education of religious ministers and to pastoral and catechetical work: coordinator of religious education in Niterói (1957-1958); educator of novices (1959-1963) and delegate of Salesian Cooperators in Barbacena (1963-1969) and professor of Philosophical Anthropology, Pastoral Theology, Liturgy and Catechetical in São Paulo and Lorena (1968-1972). Between 1975 and 1979, he was a member of the first Conselho Estadual de Educação e Cultura da Guanabara (Council of Education and Culture of Guanabara State). In the 1970s and 1980s, he was responsible for editing Catholic publications and was an advisor to the Conferência Nacional de Bispos do Brasil (National Conference of Brazilian Bishops) (1973-1980) and the International Council for Catechesis (1988-1993), a committee of the Vatican. Between 1990 and 1999, he lived in Barbacena, working at the Centro Salesiano de Documentação e Pesquisa (Salesian Documentation and Research Center). In 2000, he moved to Campos dos Goytacazes, where he died in 2008.

Ralfy Mendes de Oliveira's path exemplifies the contribution of Catholic priests to the institutionalization of psychology in Brazil during the 20th century (Loureço Filho, 1955/2004). He played a pioneering role in studies in Music Psychology, a discipline that would articulate research on basic psychological processes, information on human development and the production of techniques applied in the school context. In a period prior to the regulation of the profession of Psychology in Brazil, Mendes de Oliveira also argued that the Psychology of Music should

propose techniques for the assessment of effective sensory capacities, create methods for selecting students for music schools and guide aesthetic education practices in educational institutions. Mendes de Oliveira worked in educational institutions and research laboratories promoting the institutionalization of Psychology in Brazil around the middle of the last century.

João Inácio studied at the Faculdade de Medicina da Bahia (Medicine School of Bahia) of the Universidade Federal da Bahia (Federal University of Bahia) (UFBA) and graduated in 1926. Throughout his professional career, he played relevant roles in the fields of psychiatry, forensic medicine/criminology, and as professor and founder of the first graduation course in psychology in Bahia.

As a psychiatrist, he held several public positions. He was appointed chief physician of the Penitenciária do Estado da Bahia (Bahia's State Penitentiary) from 1928 to 1935 and alternate member of the Conselho Penitenciário (Penitentiary Council) (1934–1940), having published, during this period, the book *Criminal Biotypology*, with Rio de Janeiro's endocrinologist Waldemar Berardinelli (1903–1956) (Berardinelli & Mendonca, 1933).

Between 1935 and 1938, he served as director of the Instituto de Criminologia da Bahia (Institute of Criminology of Bahia), and then took over the direction of the Manicômio do Estado Hospital Juliano Moreira (State Mental Institution Hospital Juliano Moreira) (1938–1947). In the 1940s, a period when repression against narcotics gained strength in Brazil, Mendonça integrated the Subcomissão de Fiscalização de Entorpecentes na Bahia (Subcommission for Narcotics Inspection in Bahia) and published an article entitled *The Social Dangers of Marijuana*, in a collection organized

by the Ministério da Saúde (Ministry of Health), through the Serviço Nacional de Educação Sanitária (National Health Education Service) and the Comissão Nacional de Fiscalização de Entorpecentes (National Narcotics Inspection Commission). In this article, Mendonça tried to evaluate, based on the report of a homicide case and the description of the medical-criminological examination performed on the prisoner, the medico-legal issues arising from the use of marijuana, such as, “imputability, responsibility, dangerousness, and civil capacity,” as well as the measures of prevention and repression of marijuana use among the poorer population (Mendonça, 1958, pp. 99–105). His resume contains a list of 124 works, most of them expertise, appraisals, opinions, reports, and bulletins, among other documents, which demonstrate his effective performance as a criminal medical expert (Carvalho, 2001; Costa, 1997; Jacobina, 2001; Silva, 2010).

As a professor, João Mendonça joined the Faculdade de Ciências Econômicas da Bahia (School of Economic Sciences of Bahia) in 1935. He taught in the graduation course of Administração e Finanças (Administration and Finances) and, in 1937, took office as full professor of *psychology, logic, and ethics* of the mentioned course. In 1942, he was admitted to the then called Faculdade de Filosofia da Bahia (School of Philosophy of Bahia), currently Faculdade de Filosofia e Ciências Humanas da UFBA (UFBA's School of Philosophy and Human Sciences), and was sworn in as founding full teacher of *psychology* by Director Isaias Alves.

The insertion of psychology in the licentiate courses at the Faculdade de Filosofia da Bahia (School of Philosophy of Bahia), in the period before the profession was regulated, made it possible to form the first psychology professionals and for them to work in sectors such as education, labor, and clinic in Bahia. Besides the chair of psychology at the Faculdade de Filosofia (Philosophy School), Mendonça was also a member of the Conselho Técnico Administrativo (Technical Administrative Council), which

became the Conselho Departamental (Departmental Council), as representative of the philosophy section, and coordinated the specialization course in educational orientation.

In 1947, he defended his dissertation at the UFBA, with the theme *Learning from the psychiatric clinic: introduction to the practical didactics of mental illness clinic* (Mendonça, 1947). From the 1950s on, when national groups started to organize themselves in favor of the regulation of the psychology profession, he followed the debates and participated in the national movement and in events organized in other states, such as the I Congresso Brasileiro de Psicologia (Brazilian Congress of Psychology), which took place together with the II Congresso Latino-americano de Psicologia (II Latin American Congress of Psychology), held in 1953. This congress had been planned by Radecki, who died before it was held. He was also part of the commission that drafted the draft regulation of the profession (Baptista, 2010).

In the early 1960s, he presented to the Universidade Federal da Bahia (Federal University of Bahia) his project for the creation of a graduation course in psychology, which went through bureaucratic obstacles and political and corporative disputes for almost a decade, until it was effective in 1968. He was the first coordinator of the course. He died in 1969, a year after the implementation of the course, the first in a state public institution and in the Northeast region of the country, an important fact for the developments of psychology in Brazil (Silva, 2020).

Bolivia · Psychiatry · Social psychology

Jaime Mendoza-González was a Bolivian physician and essayist who obtained his M. D. at the Mayor Real y Pontificia San Francisco Xavier de Chuquisaca University (Major Royal and Pontifical San Francisco Xavier of Chuquisaca University, Sucre, 1901).

Endowed with a great sense of social and philanthropic service, he founded the first schools, hospitals and sports complexes in the mining centers of Llallagua and Uncía (municipalities located in the Department of Potosí, southwestern Bolivia) (Campohermoso & Silva, 2007).

He stood out due to various roles that he held such as those of poet, novelist, military man (participating in the War of Acre –border conflict and war between Bolivia and Brazil between 1903 and 1905–, as a surgeon), and teacher (at the Faculty of Medicine, 1916–1929, of his *alma mater* – which earned him the “Maestro de la Juventud”, Teacher of Youth, award granted by his own students–, where later he would become Dean and even Rector in 1930). He was also politician (deputy and later senator of the republic, representing the Department of Chuquisaca, 1931–1936), and journalist (writing for various newspapers in La Paz and Sucre, in some even becoming founder or director of others, such *Nuevas Rutas*). In 1925 he was appointed director of the Hospital Psiquiátrico Gregorio Pacheco (Gregorio Pacheco Psychiatric Hospital, Sucre), today Instituto Nacional Psiquiátrico Gregorio Pacheco.

Between 1911 and 1914 he traveled to Europe to specialize but also to broaden his cultural horizons, visiting countries such as Spain, Germany, England and France where he met the poet Rubén Darío (1867–1916), who after reading some of his original writings nicknamed him “El Gorki Boliviano” (“Bolivian Gorki”), which is a reference to the great Russian writer Maxim Gorki (1868–1936).

From his extensive work, we can highlight two novels: *En las tierras del Potosí* (In the lands of Potosí, 1911), in which he presents the inhumane experiences of the exploited workers in the mining centers of Llallagua and Uncía; and *Páginas bárbaras* (Barbarian pages, 1917), that deals with the excesses committed by Bolivian *gamonales* in the Amazon region, where rubber was exploited. Making a display of his geographical knowledge, he wrote *El factor geográfico en la nacionalidad boliviana* (The geographic factor in Bolivian nationality, 1925), in addition to *El macizo boliviano* (The Bolivian massif, 1935) stating that “the environment makes man”, stating his opinion that the greatness of the spirit of Bolivian man is equated with the magnificence and beauty of the landscapes of his land (Mendoza-Pizarro, 2016).

He also wrote numerous medical works, where his knowledge expanded to other areas of knowledge, such as psychiatry, psychology and pedagogy, in which he published articles about the psychopedagogical study of child problems in his country regarding the three socioeconomic types of children in Bolivia, *indio*, *mestizo* and *blanco*. (indian, mestizo, white) which was published fragmentarily in various sources.

In *El tripode psíquico* (The psychic tripod, 1930) Mendoza-González proposed a scheme of three strata in which instinct, affectivity and intellectuality were located, from bottom to top. This concept allows analysis and deductions to be made for the study of certain mental diseases. He spoke too of “moral intoxication,” namely the influence of psychological traumas which causes somatic manifestations. Mendoza-González was a believer in geographical determinism and in his numerous works he outlines what can be called a social psychology of the Bolivian.

Ernesto Meneses Morales was the son of José Meneses Molina, a visitor to the French Lacaud Bank and manager of the Banco Nacional de México (National Bank of Mexico), and Concepción Morales Moreno, granddaughter of the renowned lawyer Silvestre Moreno Cora (1837–1922), Presidente de la Suprema Corte de

Justicia de la Nación (President of the Supreme Court of Justice) (1899–1900) in the time of Porfirio Díaz (1830–1915). Due to the revolutionary conflicts between Venustiano Carranza (1859–1920) and Francisco Villa (1878–1923), who together with Emiliano Zapata (1915–1920), also an agrarian revolutionary, refused to dissolve their armies and recognize Carranza's authority as president of Mexico, who took office on May 1, 1917, and whose tendency was moderate and legalistic; like his father's work, Meneses's childhood was marked by upheavals, anxiety, and frequent changes of residence between the states of Tamaulipas, Tabasco, and Veracruz (Meneses, 2000).

At the age of 14, just after beginning his secondary studies in Orizaba, Veracruz, Meneses decided to become a Jesuit and joined the Compañía de Jesús (Society of Jesus) in 1929 in a residence of the order. In view of the uncertain religious situation in Mexico, at the beginning of 1930, he traveled to the United States to begin his career as a priest at Ysleta College of Paso, Texas, the house of formation for Mexican Jesuits exiled by religious persecution, which began in the nineteenth century with the War of Independence, then with the Reform Laws of 1859 proclaiming a Liberal and Secular Republic, and with the Mexican Revolution of 1910, the rebellion against the Catholic Church was radicalized. Priestly formation among Jesuits at that time involved 16 years of study (Meneses, 2000).

Because of the Second World War, Meneses was unable to travel to Europe to study the 4 years of fundamental theology that his priestly formation demanded, so in 1942 he returned to Mexico to extend his preparation in the magisterium for another year, which was another area of his priestly studies.

His stay in Mexico allowed him to attend the inauguration of the Centro Cultural Universitario (University Cultural Center) in March 1943, which in 1953 would become the Universidad Iberoamericana (UIA) (Ibero-American University). There he began his teaching work with high school students who had recently enrolled there (Meneses, 2000).

In July 1943 he returned to the United States to study theology at the Faculty of Theology in St. Louis, Missouri, Kansas (1943–1947). At the same time and at the end of his second year, he traveled to New York to begin his master's degree in education at Fordham University in the summer of 1945. He returned to Kansas to continue his theological studies, and at the end of the third year, he was ordained a priest on June 16, 1946. He remained one more year in St. Louis, Missouri, to complete his fourth year of theology. He returned to New York in the summer and fall of 1947 to complete his master's degree in education, graduating in 1948.

After his ordination to the priesthood and completion of his master's degree in education, he was appointed at Ysleta College in Texas as professor of history of philosophy, experimental psychology, and educational psychology. He also made his fourfold profession on September 8, 1950 (Vergara, 2011; Meneses, 2000).

Commissioned by the Compañía de Jesús (Society of Jesus), in 1951 Meneses moved Ysleta College to Mexico City and set up the Instituto Libre de Filosofía (Free Institute of Philosophy). The effort represented by this move demerit his health, so in 1953 his superiors assigned him to the UIA to teach the courses of general psychology and history of psychology, in addition to advising chemistry students, thus starting his career as a university professor (Meneses, 2000).

At that time, the teaching of psychology was just starting in Mexico; the teaching staff of the psychology career was mostly made up of psychiatrists, psychoanalysts, and philosophers, so the programs of the subjects and their development were poor.

In 1959, he traveled again to New York to continue his doctorate in psychology at Fordham University, returning to Mexico in 1960 to conduct his doctoral research. He obtained his doctoral degree in 1965 with a thesis entitled *An investigation of problems and leisure-time activities of a group of adolescent Mexican boys* (Meneses, 2000).

In addition to being a professor, advisor, and researcher, Dr. Meneses held various positions at the UIA. He directed the Departamento de

Psicología (Psychology Department) and the Centro de Orientación Psicológica (COP) (Center for Psychological Guidance) (1955–1958, 1960–1965) and became academic vice rector (1965–1968) and rector (1968–1977) (Meneses, 2000; Galicia, 2018).

Being simultaneously the director of the Departamento de Psicología (Psychology Department) and the COP, Meneses proposed to increase the academic level. To this end, he promoted the revision of the curricula and tried to avoid the medical and psychoanalytical bias that the degree took, opening it up to other currents such as the experimentalist, the humanist, and the study of psychometrics. Likewise, it favored the acquisition of equipment to carry out research in experimental psychology (Harrsch, 1994). He introduced the subjects of psychology of motivation, learning, and personality, and hired psychologists for the fundamental courses, which gradually gave a more genuine psychological sense to the career. In addition, he formed a library at the COP with numerous works, collections of journals, and projective materials, of psychoanalysis, psychology, and child and youth psychotherapy (Meneses, 1976a, 2000).

During his tenure as rector of the UIA (1968–1977), Dr. Meneses succeeded in granting the institution the autonomy to develop its own curriculum and official validity of its degrees and diplomas throughout Mexico. He promoted the academic reform by changing its structure to departments instead of schools or faculties, among other modifications, both structural and functional, which provided the University with a comprehensive and coherent project for the realization of its institutional ideology (Vergara, 2011; Meneses, 2000).

It also created the Fundación Ibero Ernesto Meneses (Ibero Ernesto Meneses Foundation) in 1999, now the Fundación Ibero Meneses (Foundation Ibero Meneses), as a nonprofit institution with the mission of promoting human development.

He belonged to several national and international scientific associations, and received several awards for his contributions to education, science, and community service, including an Honorary

Doctorate in Science from the UIA in 1981; honorary mention in the Premio Interamericano de Educación Andrés Bello (Andrés Bello Inter-American Award for Education), for contributing to the link between science and humanities, conferred in 1988 by the Organización de Estados Americanos (OEA) (Organization of American States, OAS); the Premio Tlamatini (Tlamatini Award) for his contribution to education, granted in 1996 by the Asociación Civil de Fomento de Investigación y Cultura Superior (Civil Association for the Promotion of Research and Higher Culture) (FICSAC); and the ANUIES Award with the Gold Medal in 1997 for his contribution to Higher Education (Meneses Flores, 2016).

Among his various publications, the book *Official educational trends in Mexico* stands out, written due to his concern for the philosophical bases of education. As there is practically no literature on the subject – it is the only history of education in Mexico written until then – he convened a team of Mexican historians who collaborated on the five volumes that make up the work, each covering a period of education in Mexico.

This book has become an obligatory reference for all research on the history of education in Mexico. In it, Dr. Meneses leaves a legacy of enormous value due to his careful analytical indexes, his extensive bibliography, statistical appendices that chronologically account for legislative changes, decrees, and legal agreements, but above all, for the identification of the major value orientations that have guided education in Mexico (Schmelkes, 1997). However, as Meneses himself warns, “. . . it is difficult to speak of a true philosophy of education in the history of Mexican education” (Proceso, 22 October 1988).

Other of his main books are *Educate by understanding the child*, derived from his experience in orienting mothers about the education of their children at the COP; *General Psychology*, the product of his experience throughout 14 years of teaching this subject; and *The Stelae of the Defeated. The Lords of Jaguar Hill*, the result of a trip to Oaxaca in which his taste for archaeology was born, among other books and articles in specialized magazines.

Dr. Meneses was devoted to the priesthood and educational tasks, and dedicated his life to guidance, service, administration, university teaching, and research. He promoted the teaching of psychology in Mexico, in proximity to history, literature, sociology, anthropology, and fine arts. By understanding man in all his complexity, he stimulated interdisciplinary and openness to all currents of thought in the teaching of psychology.

Mercado Doménech, Serafín Joel

Born *in Mexico City, March 25, 1939*

Died *in Mexico City, December 2, 2017*

Javier Urbina Soria
National Autonomous University of Mexico,
Mexico City, Mexico

Keywords

Mexico · Environmental psychology ·
Cognitive psychology · Scientific psychology

He studied a bachelor's degree in psychology at the Colegio de Psicología (College of Psychology) of the Facultad de Filosofía y Letras (Faculty of Philosophy and Literature) from the Universidad Nacional Autónoma de México (National Autonomous University of México) (UNAM), obtaining his degree in 1964. Six years later, in 1970, he received his Doctorate in Philosophy from the College of Education of the University of Texas.

Mercado's entire working life was spent at the university sphere, particularly at the Facultad de Psicología (Faculty of Psychology) (FP) of the UNAM, which in turn, due to his teaching and research activities, in 2015 conferred him the highest academic appointment: Profesor Emérito (Emeritus Professor).

One of Mercado's main contributions, perhaps the least known, is his impetus to advancing scientific psychology which he defended as a young undergraduate since 1960. Then, he and other students created Galileo Galilei, a study group in which other contemporary undergraduates participated such as Emilio Ribes Iñesta and Antonio Gago Huguet (born 1940).

Undoubtedly, both Mercado's stay with Dr. Riley W. Gardner (1921–2007) at the Menninger Clinic in Topeka, Kansas, and his collaboration, as a student, with Dr. Rogelio Diaz-Guerrero reinforced his adoption of the position to advancing the case for scientific psychology. Another two of his great contributions, these fully known, are his continuous dissemination of cognitive psychology and his drive to the development of environmental psychology in México.

In the early 1970s, both his experimental conviction and his position on cognitive psychology influenced a change in the curriculum and on the programs of the psychology bachelor's degree. This change was conceived simultaneously to the creation of the FP, as an evolution of the Colegio de Psicología (College of Psychology), mitigating the enormous influence that the behavioral approach was taking.

Later on, this tendency came to influence the curriculum of the undergraduate degree in psychology of the Universidad Veracruzana (University of Veracruz) (UV). While Mercado remained as the Director of the Escuela de Psicología (School of Psychology), later appointed the Director of the Escuela de Ciencias (School of Sciences), an important group of young psychologists led by Emilio Ribes Iñesta bred and taught their innovative curriculum. Back then, the career of psychology from the UV was, notoriously, a pole of attraction as well as a pillar to the development of an avant-garde Mexican psychology.

Mercado also participated in modifying the curricula of the master's and doctoral degrees at the FP of the UNAM, convincing its academic peers so that both graduate and post-graduate levels of study focused their work on a research-based approach.

The most representative work of his cognitive approach is the book *Procesamiento humano de información* (Human Processing of Information 1978), which became a mandatory reference not only within Mexican psychology but also throughout Latin America. Extensive was Mercado's editorial work as an evaluator and technical reviewer of translations into the Spanish language of books on thought and language (Bourne et al. (1974), on memory (Anderson and Bowen 1973), on psychometrics (Thorndike 1989), and on methodology and experimental psychology (Kerlinger and Lee 1986; Osgood 1969).

While he adopted his cognitive and scientific approach early, an impulse toward environmental psychology was wrought as part of his work tasks and university experiences, especially during his sabbatical stay at the Universidad Autónoma Metropolitana (Metropolitan Autonomous University) (UAM). There, in a team with Arq. Javier Covarrubias (born 1941), he carried out what can be considered the first formal environmental psychology research work in Mexico. Mercado analyzed the perceptions and motivations of the academic body for not fully accepting the new constructed facilities, built willfully in order to replace the barracks that temporarily housed teachers and students of the first generations and to which an emotional attachment they had developed.

Back at the FP (UNAM), an interdisciplinary group was integrated, and this started a Seminar on Environmental Psychology which produced a curriculum for such study at a master's level, being approved in 1988 by the Consejo Universitario (University Council). With the advent and development of this postgraduate degree, the psychology field expanded its frontiers of knowledge and housed other disciplines, highlighting its multidisciplinary and scientific nature in addressing environmental problems,

both in natural ecosystems and in human built environments.

Within this field, although Mercado covered it broadly, he centered his interests on a concept that he named *habitability* and focused it particularly on urban housing, a labor of which he left evidence in his works. His pioneering works in environmental psychology, his frequent participation in international congresses, and his undeniable leadership led the Environmental Design Research Association (EDRA) to recognize him, in 1991, as the father of environmental psychology in Mexico.

In the same way, in 2005, the Inter-American Society of Psychology awarded him the Inter-American Prize for Environmental Psychology, and, in 2008, the International Association for People-Environment Studies (IAPS) granted him the International Recognition for Outstanding Work and Dedication to Environment-Behavior Research while inducting Mercado into its Hall of Fame.

Other awards that he received were the bestowment, on three occasions, of the Ezequiel A. Chávez Special Chair of the FP; the 2004 Premio Nacional de Investigación en Psicología (National Prize for Research in Psychology), granted by the Consejo Nacional para la Enseñanza e Investigación en Psicología (National Council for Teaching and Research in Psychology) (CNEIP); and the Herman Ludwig Ferdinand von Helmholtz National Medal Award, granted by the Instituto Mexicano de Acústica y la Sociedad Mexicana de Acústica (Mexican Institute of Acoustics and the Mexican Society of Acoustics).

One more of his important activities was his work as a promoter of scientific and professional meetings on environmental psychology, particularly of the Latin American Meetings of Environmental Psychology, held at the Facultad de Estudios Superiores – Iztacala (Faculty of Higher Studies – Iztacala) (UNAM). In addition to his productive work in teaching and research, Mercado had a strong institutional spirit which he demonstrated by accepting additional commitments. For instance, on various occasions he held academic or administrative responsibilities such as Dean of Academic Departments (Educational

Psychology and Experimental Psychology), Dean of the División de Estudios de Posgrado (Division of Postgraduate Studies), and the Secretaría General (General Secretariat) of the FP.

It should be noted that his simultaneous participation in six ruling commissions of the academic personnel of the Department of Psychology from 1979 to 1984 covered the areas of educational psychology, general experimental psychology, work psychology, social psychology, clinical psychology, and neuropsychology. All this work not only speaks to Mercado's vast understanding and knowledge in the various branches of the discipline, but it also tells about the explicit academic recognition that the academic peers always tendered him.

Of his numerous contributions to Mexican and Latin American psychology, these stand out his early work in the dissemination of cognitive psychology and its integration into study programs; his unwavering defense of a scientific approach to psychology, with conceptual solidity and ample vision; as well as his drive to the development of environmental psychology, which in turn opened new channels for interdisciplinary work. They were all his life then, and they are his invaluable legacy today.

Mercante, Víctor

Born in Merlo, Buenos Aires, Argentina, February 21, 1870

Died in Los Andes, Chile, September 20, 1934

María Cecilia Aguinaga
Universidad Nacional de La Plata, La Plata,
Argentina

Keywords

Argentina · Child psychology · Pedagogy · Laboratory · Universidad Nacional de La Plata (National University of La Plata)

Pedagogue. He graduated as a teacher from the *Escuela Normal* (Normal School) in Paraná (Argentina) in 1889. He was Principal of the

Escuela Normal de Profesores (Teachers Normal School) of San Juan (Argentine) between 1890 and 1894. There he began his researches on behavior and knowledge of the child and published the results in *Museos escolares argentinos y la Escuela Moderna (Educación práctica)* [*Argentine School Museums and the Modern School (Practical Education)*] (Mercante, 1893) (Dagfal, 2010). He also was deputy head of the San Juan section of the *Sociedad Científica Argentina* (Argentine Scientific Society), member of the *Consejo General de Educación* (General Council of Education), *Director General de Escuelas* (General Director of Education), and member as provincial deputy in the provincial *Cámara de Diputados* (Chamber of Deputies) in San Juan (Argentina) for the *Unión Cívica* (Civic Union Party). Between 1894 and 1906, he was headmaster of the *Escuela Normal Mixta* (Coeducational Normal School) in the city of Mercedes, approximately 60 miles away from Buenos Aires city, where he implemented changes in the *curriculum* design, in teaching methods, and in school building infrastructure. In 1904, he published *Psicología de la aptitud matemática del niño* (Psychology of child's mathematical aptitude), awarded at the Universal Exhibition of Saint Louis (the United States). In 1906, Joaquín V. González (1863–1923), president of the *Universidad Nacional de La Plata* (National University of La Plata) (Argentina), summoned him to direct the *Sección Pedagógica* (Pedagogy Section) of the *Facultad de Ciencias Jurídicas y Sociales* (Legal and Social Sciences Faculty), one of the first Argentinian university institutions for education training. There he also served as psychopedagogy and methodology associate professor, and founded three laboratories: the nerve micrography, the pedagogical anthropology, and the experimental psychology, where he conducted researches with students from schools belonging to the *Universidad Nacional de La Plata* (National University of La Plata) (Vallejo, 2007) as research subjects.

He was dean of the *Facultad de Ciencias de la Educación* (Education Sciences Faculty) at this university from 1914 until his retirement in 1920. He directed the journals *Archivos de*

Pedagogía y Ciencias Afines (Pedagogy and Related Sciences Archives) (1906–1914) and its continuation, the *Archivos de Ciencias de la Educación (Education Sciences Archives)* (1914–1919) (Barletta, 2011). Between 1915 and 1916, he was *Inspector General de Enseñanza secundaria, normal y especial* (General Inspector of High School, education of elementary teachers and special education), and advised the Justice and Public Education Minister, Carlos Saavedra Lamas (1878–1959), in the implementation of an education reform valid until 1917. This reform incorporated an intermediate school level between the elementary school and the secondary school, and included professional education subjects, laboratories, and observation rooms. The theoretical foundation of the reform, related to the changes that young people experience during puberty, was exposed in *La crisis de la pubertad y sus consecuencias pedagógicas (Puberty crisis and its pedagogical consequences)* (Mercante, 1918) (Dussel, 1993). After his retirement, he was appointed honorary professor at the *Universidad Nacional de La Plata* and dedicated himself to writing and lecture. He was a member of the International Society of Paidology of Paris and the American Academy of Political and Social Science of Pennsylvania, among others (Malter Terrada, 1944). He carried out a sustained task of spreading scientific theories through lectures directed to a nonacademic audience and through publications in the media. He died returning from Chile, where he had participated as an Argentine delegate of the *Segundo Congreso Panamericano de Educación* (Second Pan-American Education Conference).

He developed naturalistic and evolutionary psychology, based on positivist philosophy (Ali Jafella, 2007; Talak, 2008). He called his area of inquiry *Paidology*, defined as the study of the child and considered as a preliminary science of pedagogy. Comte (1798–1857), Darwin (1809–1892), Spencer (1820–1903), Haeckel (1834–1919), Claparede (1873–1940), Stanley Hall (1844–1924), and Lombroso (1835–1909), among others, are the authors that are part of his theoretical and methodological framework (Ostrovsky, 2011).

He conducted several researches based on observation, experimentation, and administration of questionnaires to large groups of children and adolescents, whose results were statistically analyzed. His subjects of inquiry included affectivity, aesthetic feelings, sensory acuity, the mental type of the sexes, attention, memory, mental fatigue, knowledge development, behavior, and the learning process. The fundamental category of his theorization was the aptitude, analyzed in its relations with physical characteristics, ethnicity, nationality, sex, and environmental determinants (Aguinaga, 2018). He systematized a series of procedures for the teaching of mathematics, reading, spelling, composition, and natural sciences. Although he considered inheritance as a determining factor of psychological characteristics, his theorization and his methodological proposals contemplated educational intervention as a modifying action of skills and behavior in the medium or long term. Despite much of Mercante's theorizations being questioned by subsequent developments in Argentine psychology, his theoretical and methodological contribution at the early stage of the discipline in the country is unquestionable.

Thereza Mettel was graduated in Language Studies in 1950 at University of Rio de Janeiro. From 1954 to 1956, she attended as a graduate student to a specialization course offered by the National Child Department of Brazil's Health Ministry, titled Health Clinical Psychology of Children and Youth. In 1958, she obtained a Fulbright scholarship to attend to a specialization course in Psychological Counseling at the University of Wisconsin in the USA, where she also obtained her Master and Doctoral degree in Psychology (1963), advised by Carl Ransom Rogers (1902–1987).

Back to Brazil in 1964, Thereza became a professor teaching clinical psychology at the Faculty of Philosophy, Science and Letters of Ribeirão Preto – University of São Paulo (USP) until 1965. There she helped the Faculty to organize and implement its undergraduate course in Psychology. Back to the USA in 1965, she worked as a clinical psychologist at the University of Wisconsin (1965–1968), and in 1967, she worked as a postdoctoral fellow at the *Children's Treatment Center*, Madison, Wisconsin. She returned to Brazil in 1969 and worked as the coordinator of the Child Psychology Service of the Neuropsychiatry and Medical Psychology Department of the Faculty of Medicine of Ribeirão Preto, São Paulo, until 1974. There she worked as part of a Health Psychology interdisciplinary team in charge of caring for hospital

inpatients, promoting innovative actions such as introducing mothers to care for their children in the infirmary. While in the United States, Thereza worked with Ole Ivar Løvaas (1927–2010), and this allowed her to become a pioneer in diagnosing and treating autistic children from a behavioral approach in Brazil. From 1970 to 1975, she also worked as an advisor of graduate students in the Graduate Program of the Experimental Psychology Department at the University of São Paulo.

From 1974 to 1975, Thereza was a professor at the Catholic University of Rio de Janeiro (PUC-RJ) and became an active member of the group in charge of implementing there the Doctoral Program in Educational Psychology, which involved the Department of Psychology and the Department of Education of that university. At that time, she became the president of the Regional Council of Psychology (Fifth Region), and in 1975 she moved to Brasília to help in the implementation of the Graduate Program in Psychology of the University of Brasília (UnB).

At the University of Brasília, she actively participated in the organization of Councils of Psychology in the country and in the preparation of psychologists, Masters and Doctors in Child Psychology, Developmental Psychology (concerning the study of children and adolescents) and also played an important role in the development of Health Psychology in the country. She carried out, and advised, relevant research in these areas of Psychology, adopting an integrated theoretical perspective stemming from her rich and productive experience as a scientist familiar with Behavioral Analysis, Client-Centered approach, Systemic approach, and Human Ethology. Some of her research topics were mother-infant communication, children's play, child-child interactions, family and teacher-students interactions, with emphasis on promoting children development by working with teachers and mothers of poor families, guiding them to deal with pupils and offspring. At the University of Brasília, she actively participated in a team work with medical doctors and psychologists to promote the recovery and development of undernourished children. She always insisted on the importance of health professionals to establish a positive and trust bond

with patients and their families, highlighting the role of good quality relations and communication with people as the cornerstone of any health improving therapy.

From 1976 to 1979, Thereza was a board member of the Federal Council of Psychology. In 1979, the 6th Regional Council of Psychology honored her with a medal, the “Scientific Psychology Centenary,” for her outstanding contribution to the development of Psychology in Brazil, and next, from 1980 to 1983, she presided the 1st Regional Council of Psychology. In 1981, the Brazilian National Council for Scientific and Technological Development (CNPq) awarded Thereza with a medal for her same relevant contribution to Psychology. She actively participated as member of CNPq and of the Higher Education Personnel (CAPES) of the Brazilian Ministry of Education. She helped creating two scientific journals: *Psicologia: Teoria e Pesquisa (Psychology: Theory and Research*, Institute of Psychology, University of Brasília) and *Psicologia Ciência e Profissão (Psychology: Science and Profession*, a journal of the Federal Council of Psychology). She was the chief editor of *Psicologia: Teoria e Pesquisa (Psychology: Theory and Research)* from 1989 to 1991 and of *Psicologia Ciência e Profissão (Psychology: Science and Profession)* from 1994 to 1998. After retiring in 1994, the University of Brasília honored Thereza with the Emeritus Professor title in 2006.

Thereza dynamically participated in the organization of Regional Councils of Psychology in the country as well as co-founded the National Association of Research and Graduate Programs in Psychology (ANPPEP), in which she worked as vice president from 1988 to 1990 and as president from 1990 to 1992. She also co-founded the Brazilian Psychological Association and became a permanent part of its board. Her work was seminal to consolidate scientific research in Clinical Psychology, Human Development, and Health Psychology, advising dissertations and supervising graduate and undergraduate students to work as future professors and professionals. Her training and experience under Carl Rogers supervision, together with her training and experience as a behavior analyst, allowed her to develop a broad

and systemic view on psychological science and profession. She highlighted the need to study children and adolescents within their natural contexts, in relation to family, school, and other contexts. She underlined the centrality of Ethics and considered empathy and care as utmost qualities of professionals and researchers in Psychology and in medical areas – like physicians, nurses, etc. The affective quality of human relations, according to her, should be the keystone of any psychological or medical intervention.

Thereza always positioned herself against any theoretical or methodological radicalisms. In an interview to the journal *Psychology: Theory and Research* (Branco et al., 2007 p. 133), she said that “in science, there is no final ‘truth’, but only the search for the truth.” According to her, “we need to know how to engage in dialogue, within the realms of Psychology. The dialogue is necessary!” As leader in the organization and development of Psychology in Brazil, she contributed as a constant speaker and discussant in scientific Conferences and Congresses and exerted a significant influence on renowned professionals and academics in charge of educating future psychologists and researchers in the country.

Mier y Terán Rocha, María del Carmen

Born *in Mexico City, Mexico, August 1, 1942*

Laura Olivia Amador Zavala and Oscar Javier Carranza Plancarte
Autonomous University of Aguascalientes,
Morelia, Mexico

Keywords

Mexico · Social psychology · Migration ·
Violence · Gender · Violence against women

She was born and lived most of her life in Mexico City. She studied Psychology from 1962 to 1965 and graduated in 1973 at the Universidad

Iberoamericana (Iberoamerican University) (IBERO). Subsequently, she studied a master's degree in Social Psychology (1968–1969) and a PhD in Clinical Psychology (1993 generation) at IBERO. She specialized in Humanistic Psychotherapy at her alma mater (1970–1974) and later in Couple and Family Psychotherapy at the Instituto Personas (1987–1988).

Her first approach as a researcher was during the development of her undergraduate thesis, which she carried out in Chihuahua, between 1965 and 1966; during this time, she analyzed the psychosocial effects of the migration of a poor Tarahumara community.

Although her undergraduate curricular training was based on the psychoanalytic approach, her professional and clinical interest led her to focus on a social perspective on the diverse realities of individuals. The migration of families living in the countryside led to the accelerated population growth of Mexico City mainly in the late 1960s and early 1970s; this oriented her academic and professional interest toward social problems such as violence and migration and became one of the first referents in the development of studies on migration (from rural to urban) from a psychological perspective.

In 1987, she began her professional practice as a psychotherapist. Between 1968 and 1978, she worked as a researcher at the Center for Social Promotion of the IBERO. From 1972 to 1974, she was appointed Coordinator of Research Projects at the Mexican Center for Drug Dependency Studies.

She had a boost to social psychology not only for her contributions to research and clinical practice but also for her participation in the development of the curriculum for the creation of the bachelor's degree program in Social Psychology at the Universidad Autónoma Metropolitana-Iztapalapa (Autonomous Metropolitan University-Iztapalapa) (UAM-I), which was established in 1974. This milestone was relevant not only for the training of psychologists but also for the development of research in the social field up to the present day. This degree was promoted by the Department of Sociology of the UAM-I and the hand of Dr. Luis Villoro Toranzo

(1922–2014), Mexican philosopher, teacher, researcher, and diplomatic, as well as a great team of collaborators where Mier y Terán contributed from his academic and field experience to the design and curricular content of the program.

After which at UAM-I, she was a research professor from 1974 to 2006, when she retired from academic activity (Universidad Autónoma Metropolitana unidad Iztapalapa, 2020). In that institution, she held various positions; she served as Coordinator of the Bachelor's Degree in Social Psychology (1975–1978), Head of the Department of Sociology (1979–1982), and Coordinator of the Mental Health Program (1999–2002). At this university, she offered a total of 96 courses in the Bachelor's Degree in Social Psychology, teaching theoretical and applied subjects. In total, she directed and advised 98 theses in Social Psychology at UAM-I, emphasizing the topics of social psychology, migration, psychological and sexual violence, gender perspective, abortion, impact of divorce on children, and human rights of children, among others. From 1974 to 2005, she taught elective courses on gender construction and identity, family and couple relationships, field and community work, and, finally, violence from a psychosocial perspective (2002–2006).

She also taught in master's and doctorate programs at IBERO (1994–1996) and the Universidad de Morelos (University of Morelos) (1995–1996). Regarding graduate theses, she advised one master's thesis and three doctoral theses at UAM-I, IBERO, and Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM).

As part of the research team at UAM-I, in the 1990s, she joined the Consejo Nacional de Ciencia y Tecnología (National Council of Science and Technology) (CONACyT) with a research project on the treatment of violence in low-income families, resulting in one of his most interesting publications in which she addressed the experience in changing the lifestyle of migrant families from rural to urban areas. In this project, she was also linked to the “Reintegra” centers (which are still operating in Mexico City) and worked with street children and young people who had fled their homes due to violence and

were reintegrated into their families. This experience led her to visualize the impact of antisocial behavior and violence, integrating the social aspect of these problems into her work as a family therapist.

Once retired from UAM-I, Mier y Terán moved to the city of Querétaro where she worked as a psychotherapist at the Central de Servicios a la Comunidad (Community Services Center) (CESECO) of Santa Bárbara and San Juan del Río of the UAQ (2007–2015). She also has been responsible for the Programa de Prevención y Tratamiento de la Violencia (Prevention and Treatment Program), which is still in force (Universidad Autónoma de Querétaro, 2021).

Among the multiple activities she developed, it is worth mentioning her participation as a member of the International Editorial Committee of the journal “Alternativas en Psicología” coordinated by the Asociación Mexicana de Alternativas en Psicología (Mexican Association of Alternatives in Psychology) (AMAPSI) (from 2003 to date) (Revista Alternativas en Psicología, 2021). She was Guest Professor at the Universidad Autónoma de Barcelona (Autonomous University of Barcelona) (UAB) (June 1993 and September 2005); a judge in the Annual Research Awards of the Universidad Autónoma de Nuevo León (Autonomous University of Nuevo Leon) (UANL) (1994–2009); jury of the Academy Awards for the best doctoral theses in social sciences and humanities granted by the Academia Mexicana de Ciencias (Mexican Academy of Sciences) (2003); and coordinator of the Editorial Board of the Division of Social Sciences and Humanities of the *Revista Iztapalapa* (Iztapalapa Journal) of the UAMI (1988–1989), among others.

She published nearly 20 articles highlighting the perspective of migrants and the design of strategies to improve their quality of life. Based on gender perspective analysis, she detailed how women who migrated from rural to urban areas unwillingly perpetuated their roles by limiting themselves to family and household work without receiving economic remuneration; this caused frustration, feelings of dissatisfaction, doubts about their own capabilities, high levels of stress, and

an uncertain and pessimistic future. Another study, also focused on women, is working on the analysis of sociocultural and family characteristics of women deprived of their liberty and how these permeate both antisocial behavior and drug use.

She also received an acknowledgment for her career given by the Department of Psychology of IBERO, which can be found in the Journal of the Department of Psychology January to July 1992 Vol. 5 Num. 1 and 2 page 8. From this same institution, she received an acknowledgment for the investigation of his doctoral thesis on February 15, 1994.

Finally, it should be noted that doctor Mier y Terán currently lives in the city of Querétaro, where she continues to work in private clinical practice and collaborates with community centers for low-income people.

Polish psychologist. She was one of the first graduates of the undergraduate psychology programs in Argentina. She mainly contributed to the

scientific studies of personality. She was a pioneer in the diffusion of Hans Eysenck's factorial model in South America.

Ewa Borkowska – according to the Polish spelling – was the daughter of Tadeusz Jan Kazimierz Borkowski and Elżbieta Raps.

Her access to early literacy was encouraged by her father. From her childhood, she frequented great classics of Polish national and world literature. She studied humanities and learned languages at the College of the Sisters of Notre Dame. However, her aspirations to enter university were long deferred.

The celebration of Ewa's eighteenth birthday was overshadowed and tragedy broke into the peaceful life of the Borkowski family with the invasion of their homeland – on September 1, 1939, by the Nazi Army, and on September 17 by the Soviets – triggering World War II. The family consequences of these events were magnified since Ewa's father was a military judge in the Polish army. He managed to escape the genocide known as the Katyn massacre, in which about 22,000 Polish citizens (officials, civil servants, landowners, intellectuals, Christian priests, under the accusation of being saboteurs) were shot on Stalin's orders (Biskupski, 2018). However, officer Borkowski was taken prisoner while Ewa, her mother, and her brother were deported by Narodny komissariat vnutrennikh-NKVD (People's Commissariat of Internal Affairs) to the region of Siberia for two years (Mikusinski, 1996). After losing contact with the father and living through shocking survival experiences, they were released in 1942 and the family managed to reintegrate. Ewa enlisted in the Women's Military Service acting under British command in administrative tasks and official missions. As a result, she went from Iran, Iraq, Egypt, and Palestine to England and Ireland, obtaining several awards. In 1945, shortly before the end of the war, she was transferred to France. There she met and married Zygmunt Jerzy Mikusinski (Kresy Siberia Virtual Museum, 2014; Mikusinski, 1996).

In search of work opportunities, the Mikusinski family migrated to Argentina, a country that seemed promising because it was

undergoing a process of modernization and industrialization. They settled in San Luis, a small city in the center of the country. There Eva Mikusinski – as she became known – was employed as a librarian and translator at the Departamento Técnico del Ministerio de Educación de la Provincia (Technical Department of the Provincial Ministry of Education) (Mikusinski, 1996).

From 1940 onwards, new cultural scenarios opened up in San Luis with the opening of university studies at Universidad Nacional de Cuyo-UNC (National University of Cuyo), due to the name of the region, Cuyo, which included the provinces of Mendoza, San Luis and San Juan. The new UNC gradually opened up the way for scientific development and, in particular, for psychology in the province of San Luis. In 1953, with the interest of making higher education for teachers a priority, a specialization course in psychology was opened. In 1956, under the direction of Plácido Horas (1916–1990), the Instituto de Investigaciones Psicopedagógicas (Institute of Psycho Pedagogical Research) was organized and, in 1958, the undergraduate Psychology Program was established (Klappenbach, Marincevich, Arias and Berastain de Montoya, 1995).

Within this framework, Eva Mikusinski managed to enter university in 1949. She graduated as Professor of Pedagogy and Philosophy and joined the Institute's teaching staff. She was among the first students in the undergraduate Psychology Program in 1958, and she graduated in 1963 with an undergraduate thesis on: *Elaboración de una escala actitudinal para medir la supersticiosidad. Estudio Preliminar* (Elaboration of an Attitudinal Scale to Measure Superstitiousness. Preliminary Study).

Immediately, she started her PhD in Psychology, and she was the second one to achieve this degree at the UNC, and possibly in the country (Piñeda, 2018b). Most of her postgraduate training was done between 1964 and 1966 at the University of London (Department of Psychology, Institute of Psychiatry, Maudsley Hospital) under the direction of Hans Eysenck (1916–1997). At the same time, she took several seminars at the

Tavistock Clinic and the West Hampstead Clinic directed by Anna Freud (1895–1982). This opportunity was provided by a grant from the recently created Consejo Nacional de Investigaciones Científicas y Técnicas-CONICET (National Council for Scientific and Technical Research) (Berastain de Montoya, 1995; Mikusinski, 1996), whose funding was unusual for the social sciences at the time (Hurtado, 2010).

On her return, in 1966, she became Director of the Institute of Psycho Pedagogical Research until 1973, when the UNC's San Luis headquarters became the Universidad Nacional de San Luis-UNSL (National University of San Luis). At this new university, Dr. Mikusinski continued her work as a professor and researcher in psychology. There she developed a training program for psychologists and research focused on the scientific study of personality, mainly from the Eysenckian perspective, but also integrated contributions from Paul Fraise (1911–1996) (La Sorbonne, Paris, France) and Robert Kastenbaum (1932–2013) (Wayne State University, Detroit, USA) who guided her in postdoctoral studies (between 1969–1970 and 1972, respectively). He conducted several research projects of the highest scientific level and social relevance for the region. He trained several generations of psychologists, directing a hundred theses on personality and motivation. These investigations contributed to the construction and validation of tests for psychological evaluation that were pioneers in Latin America, among them, the first adaptation of the Eysenck Personality Scale in South America (Andrade and Leone, 2013; Piñeda, 2018a).

In 1986, the researcher decided to retire in order to be free to emigrate to France to foster new family projects. However, the UNSL extended her academic work as Consulting Professor and Representative Member in France. CONICET hired her for two more years as Principal Researcher (one of its highest ranks in the scientist career). At that stage, Dr. Mikusinski joined the Laboratory of Experimental Psychology directed by Paul Fraise, continuing with the studies on personality and motivation.

In 1987 she took part in the founding ceremony of the Asociación Argentina de Ciencias del Comportamiento (Argentine Association of Behavioral Sciences-AACC), one of the most important scientific societies in the field of Psychology in Argentina (Piñeda, 2010).

In 1989 she decided to finish his scientific work and definitively retire to family life.

Andrés graduated from the Universidad de Barcelona (University of Barcelona) in 1954 with a

degree in literature. When he arrived in Venezuela, he worked for International Business Machine (IBM) as a manager of orders and programs. He began his studies in psychology at the Universidad Católica Andrés Bello (UCAB) (Andrés Bello Catholic University) in 1961, culminating in 1965. Then he developed a postgraduate degree in psychological counseling, which he completed in 1967.

He directed the Escuela de Psicología (School of Psychology) of the UCAB (1969–1972), serving at the same time as a professor in the courses of general psychology, personality, and psychological counseling. During his tenure, he completed the curricular renovation of the undergraduate program in psychology, which had been in force since 1965; he changed the length of the curriculum from four (4) to five (5) years and incorporated the development and presentation of the graduate work for the completion of the degree.

The new curriculum was validated by Benjamin Wolman (1910–2000) and B. F. Skinner (1904–1990). Skinner visited the university and carried out academic activities during their presence as an external peer reviewer. In particular, Dr. Skinner visited UCAB in February 1972, being the first school of psychology in a country outside the USA to be visited by him due to the efforts made by Dr. Miñarro.

The curriculum proposed in 1970 has been revised every decade since then, only covering variations and not profound changes, which confirms the soundness of the study plan developed by Miñarro and his collaborators at the end of the 1960s.

Along with his work as director of the School of Psychology, he worked as a counseling psychologist (1970–1971) at the Centro de Orientación del Colegio La Salle La Colina (Counseling Center of La Salle La Colina High School), where he incorporated undergraduate students in professional practices related to psychological counseling (Gómez, 2008).

In 1972, a strong institutional crisis arose in the UCAB due to the demands for renewal in its management lines, made by students and professors, which caused the disincorporation and dismissal of some of them, as a result of the instructions of the rector and in response to the recommendations of the commission of the

Episcopate and Rome. These recommendations urged to leave Marxist thought out of the institution. This triggered a series of demonstrations and the closure of the university. The calm came with the resignation of Rector Pío Bello and the reinstatement of students and professors.

All these events led him to leave his position as director. Subsequently, he worked in market research and public opinion in the private sector (1973–1982), field in which he published one of his most important publications, whose content is oriented toward statistical analysis in market research (Miñarro-Llagostera, 1989).

He returned to UCAB (1983) as Dean of the Facultad de Humanidades y Educación (Faculty of Humanities and Education), which made him the first psychologist to hold such an important position. He received the degree of Doctor with honors for his dissertation on *Effectiveness of a psychotherapy based on Transcendental Meditation in modifying "type A" behavioral patterns in Ischemic Cardiopaths* (Miñarro-Llagostera, 1987).

During his tenure as a dean, he accompanied other professors in the creation of the postgraduate degrees in Desarrollo Organizacional (Organizational Development) and Psicología Cognitiva (Cognitive Psychology), subjects where his experience in the organizational area and his wide knowledge in artificial intelligence constituted excellent support for their development. He was part of the academic staff of these postgraduate programs.

He finished his work in the dean's office in 1991 and founded the Centro de Investigaciones del Comportamiento (Behavioral Research Center), and he remained in that position until his retirement (2003). He also coordinated the research line on culture and organizational climate and was part of the organization of the journal *Analogías del Comportamiento* (Behavioral Analogies), a publication that is still in force at the School of Psychology (Gómez, 2008).

He was appointed executive secretary of the Consejo de Desarrollo Científico, Humanístico y Tecnológico (Council for Scientific, Humanistic and Technological Development, CDCHT) of UCAB (1995), from where he contributed to the formulation and consolidation of the university's research policy.

His participation in activities of a professional nature was diverse: At UCAB he was a faculty advisor in different areas. In the public sector, he contributed to the creation of the Law for the Practice of Psychology – sanctioned in 1978 – and of the Federación de Psicólogos de Venezuela (FPV) (Federation of Psychologists of Venezuela), an institution in which he was accredited with the number 145.

For his academic merits and contribution to society, he received several distinctions: By the Venezuelan State, he received the Francisco de Miranda Order (1978) and the Andrés Bello Order (1988); by the FPV, the "Order of Merit" (1987), and by the UCAB the Order "Academic Merit" in its first class (1991).

Son of the military doctor Rafael Mira Merino, a specialist in tropical medicine and subinspector of Health of the Spanish Army in Cuba, and Emilia López García, Emilio Mira y Lopez was born in Cuba when his father was serving there. The family returned to Spain after the independence of that Spanish colony (1898), settling initially in Galicia, soon moving to Barcelona. It was in this city that Mira completed his studies, did his medical studies, and built his professional life. In 1918, he was a clinical assistant physician at the Clinical Hospital of Barcelona. He obtained his doctorate at the Complutense University of Madrid, with the thesis *Las correlaciones somáticas del trabajo mental* (the somatic correlations of mental work), in 1922, in which he sought to demonstrate that there is a positive correlation between psychic processes and the activity of the vascular and vegetative systems (Miralles Adel, 1979). All his titles were obtained with praise.

After graduating, Mira and Mrs. Pilar Campins were married in 1919. The couple had three daughters.

He became a physician at the Barcelona mental illness dispensary and, in 1924, was appointed as a psychiatrist at the Municipal Assistance Office. In 1926, he became a physician in the Asylum Psychiatry Section of the Parque de Barcelona and participated in the creation of the Association of Neuropsychiatrists. In 1930, he became a member of the International Committee of Mental Hygiene and, in 1932, a medical consultant to the Instituto Mental Pedro Mata. Finally, he was appointed professor of Psychiatry at the University of Barcelona in 1933. He taught at the Clínica Psiquiátrica Municipal de Urgências (Miralles Adel, 1979; Pigem Serra, 1996). Also in 1933, he became director of the Instituto Psiquiátrico de Sant Boi (Sección de Mujeres) and took over a private enterprise, together with Jerónimo de Moragas: the Clínica Psiquiátrica Infantil La Sageta. He held other positions: in 1934, president of the Catalan Society of Psychiatry and Neurology, vice-president of the Spanish Association of Neuropsychiatrists, member of the Higher Psychiatric Council of Madrid; until 1937, he edited the *Revista Catalana de Neurologia i Psiquiatria*; in 1935, he was president of the Spanish League of Mental Hygiene and director of the Instituto

Psiquiátrico Feminino de Sant Boi; in 1936, he created the Preventorio de Psiquiatria Municipal. Mira's theoretical approach is seen by many authors (Miralles Adel, 1979) as developed in his psychiatric face, with some characteristics: (a) the relevance of the role of science in improving the conditions of everyday life, since science can be subdivided into "pure science" and "applied science"; (b) evolutionism as the main mark of this science; and (c) the psychophysical unity of the human being. These characteristics will be present in his entire work.

Parallel to his work as a psychiatrist, Mira became in 1919 in charge of the Psychometrics section of the Institute of Professional Guidance. The so-called School of Psychotechnics of Barcelona obtained international recognition, enabling the II International Conference of Psychotechnics, of the recently created International Association of Psychotechnics – after 1955 renamed the International Association of Applied Psychology (IAAP) – to take place in Barcelona in 1921 and Mira to be the president of the VI Conference, also in Barcelona, in 1930. When he took over, one of the questions was whether the institute would make professional orientation or selection, since in many countries where the psychotechnics selection was implemented, there were violent protests from the worker, under the consideration that many of them would be without work with the use of this model. In Mira's vision, the selection could be seen in a positive way, because instead of detecting who is not suitable to occupy a place, it would indicate who is the most suitable to carry out such work, and who would be more suitable for other functions. The institute has decided to dedicate itself fundamentally to guidance, without leaving the possibility of making any selection whenever the need so requires (Pigem Serra, 1996).

Mira also held various positions in the area of psychotechnics. In 1926, he became director of the Institut de Orientación Profesional which, with the proclamation of the Republic in 1931, became the Institut Psicotècnic de la Generalitat. He also taught courses in Legal Psychology in 1931, which allowed him to publish one of his best-known books (Mira y López, 1932). He created the first journal of psychology in Spain,

Revista de psicología i pedagogia (Saiz & Saiz, 1996).

He was due to be the president of the 11th International Congress of Psychology, which should have taken place in Madrid in 1936 and which, due to the Spanish Civil War, was transferred to Paris, to be held in 1937. Mira was against cancellation and transfer, arguing that the (war) situation would be an opportunity for participants to learn more psychology than in their peaceful universities (Carpintero & Lafuente, 2008).

In Barcelona, he was a member of the *Unió Socialista de Catalunya* and editor of its newspaper, as well as acting in popular clinics. With the Spanish Civil War (1936–1939), he became head of the Psychiatric Services of the Republican Army in Catalonia, also performing selection of pilots and recruits, on which occasion he created the first version of what would later be his myokinetic psychodiagnosis test (PMK). He directed the Women's Professional School, created to enable the replacement of mobilized men.

With the defeat of the Republican Army, Mira managed the evacuation of the patients who were under his care and went into exile with his family in France. His Cuban socialist friends sent him Cuban passports (Rosas, 1995), which enabled him to begin his tour in different countries: France, England, the United States, Cuba, Argentina, and Uruguay, before settling in Rio de Janeiro, Brazil (1947), until his death in 1964.

From France, Mira went to England with a scholarship as a research fellow of the Society for Protection of Science and Learning, where he completed the preparation of the PMK at the Maudsley Hospital in London, making the first communication about it to the Royal Society of Medicine on October 12, 1939.

After Europe, he went to the United States and Cuba, giving lectures and courses. He attained his first permanent post in Argentina, where his wife and daughters went to meet him in 1940. It seemed like a good choice, a Spanish-speaking country, known for its European references, and where many Spaniards were already exiled. He became a psychiatrist at the La Chapelle, a private sanatorium.

In 1941, he was invited to give courses in Chile. He returned to the United States also in 1942 where he gave lectures in different universities, becoming a fellow of the American Psychiatric Association.

His main work in Argentina took place in 1943, when he was named director of the Psychiatric and Mental Hygiene Services of the Province of Santa Fe, where he founded and directed the Psychiatric Hospital, named Psychiatric Hospital Dr. Emilio Mira y Lopez. He lost his post because of his political background (Rossi et al., 2014).

Although Mira y López lived in Argentina for only 4 years, his contribution was meaningful for certain groups of academics – such as Horacio Rimoldi (1913–2006), Nuria Cortada (1921–2013) – who aspired to a scientific psychology, seeking to overcome traditions oriented towards philosophy, deeply rooted in the academic culture of the country. Despite the scarce institutional insertion that he achieved in Argentina, through a solid, wide, and lasting network of informal relationships, he contributed mainly to the development of psychotechnology that influenced the beginnings of the process of professionalization of psychology during the 1950s (Piñeda, M. A., sep. 2020, personal comment).

Even after he had already settled in Brazil, he kept publishing in Argentine media such as Kapelusz and El Ateneo publishing houses, producing works of applied psychology that shaped several generations of scholars in that country. Also, his PMK continued to be widely used in the country during the 1950s.

As a result, in 1944, he migrated to Uruguay, hired by the Ministry of Education of that country to create and run the Institute of Professional Guidance of Montevideo. He directed the Sebastián Morey Otero Psychopedagogy Laboratory, where he began the systematic application of PMK in school children. It was on this occasion that he met Alice Galland, a sanitary nurse, trained in Switzerland. Mira divorced D^a Pilar, who returned to Spain with their daughters, and began a new life with Alice Galland.

In 1945, on the recommendation of Helena Antipoff, he held lectures in several cities in Brazil, at the invitation of governmental and private

institutions. With their success, he was invited to organize and direct the Instituto de Seleção e Orientação Profissional (Institute of Selection and Professional Guidance, ISOP), an autonomous organ of the Getúlio Vargas Foundation, an institution located in Rio de Janeiro (Brazil) that had as its objectives the documentation, study, and research in the field of work rationalization (Rosas, 1995).

Mira settled in Rio de Janeiro with his wife, D^a Alice, in 1947. The four children of this union were born in this city.

In Brazil, he did not restrict himself to psychotechnics, maintaining a private practice, although he did not revalidate his medical degree. He maintained his international trajectory. His routine in the following years was to go to universities in different countries, teach courses, and receive degrees: Guatemala, Mexico, Cuba, and Venezuela (1948); Cuba (1954 and 1956); Argentina (1955, as president of the Experimental Psychology Section of Unesco); Venezuela (1958); Cuba and Argentina (1960); and Ecuador (1962). He also continued his participation in international congresses, such as the International Congress of Applied Psychology (ICAP), in Bern (1949), Paris (1953), London (1955, where he was the delegate of Brazil), and in Rome (1958). He also participated in other congresses, such as the International and Latin American Psychiatry Congresses. He participated in the XIII International Congress on Psychology (ICP, 1951), which founded the International Union of Psychological Science (IUPsyS) and in whose assembly he was present, together with Helena Antipoff, representing Brazil (Rosenzweig et al., 2000). The proceedings of the I Interamerican Congress of Psychology (CIP), held in the Dominican Republic in 1953, state that he was cited six times by the lecturers, among them Werner Wolff (1904–1957), the first vice president of the new entity, the Interamerican Society of Psychology (SIP). In 1955, he was elected vice president for the Atlantic Region of the SIP, and 4 years later, he was secretary-general of the VI Interamerican Congress of Psychology, which took place in Rio de Janeiro, the first international congress of psychology held in Brazil.

Although the epicenter of his activities in Brazil was ISOP, he taught courses for several organs of the Armed Forces, probably as a result of his work focused on military psychology, and organized the Professional Guidance Service of the Education Secretariat of the State of Minas Gerais, as well as, together with Helena Antipoff, the National Department of Children.

At ISOP, it created the perspective of articulating the scientific work with the daily problems and with practical actions to solve them. The organ was constantly reported in the newspapers at the time, either by its activities or by the frequent interviews with Mira or the publication of his articles on psychosocial topics. ISOP branches were created in seven other Brazilian states. The Brazilian Association of Psychotechnics (1949) and the journal *Arquivos Brasileiros de Psicotécnica* (1949) were created, and Mira was the general secretary of the journal.

In Brazil, Mira was unable to join the university faculty because he chose not to validate his medical degree. Despite this, he was responsible for the training of a large number of the first Brazilian psychologists, through the numerous extension courses offered by ISOP as well as through his lectures. Its audience came mainly from those graduated in education and philosophy courses, avid for knowledge in psychology. This audience was the basis of the movement for the regulation of the profession and of psychology courses, which began with the draft law proposed by the Brazilian Psychological Association, published in the *Arquivos Brasileiros de Psicotécnica* in 1954 (Jacó-Vilela & Rodrigues, 2014).

ISOP, the journal and the association formed a cohesive whole that corresponded to the needs of the country at that time: With the emphasis on industrialization, it needed a type of knowledge, psychology, and technicians – the psychologists – capable of dealing with the implications of the “human factor” in the rationality of the new mode of production.

Mira’s written production is vast and varied, involving books, with various translations and editions; articles in scientific journals from

different countries; articles in newspapers; and interviews, which can be seen in the issue of *Arquivos Brasileiros de Psicotécnica* dedicated to his memory (volume 16, issues 2 and 3, 1964). This aspect had been initiated for financial reasons, as a translator of German psychiatry works as well as Freud's books. One of his most important works is the *Psychiatry Manual* of 1935, in three volumes. In general, his biographers saw a cut in his production – the effective one, which lays new intellectual foundations, was situated in the Spanish phase. In the intermediate phase, there was a great work, *Psychiatry in the War* (1944), fruit of his experience in the Spanish Civil War. In the Brazilian phase, however, his production is basically a recompilation of the previous production, often only translation into Portuguese; he used mainly Argentinean publishers, as many of these were also exiled from Spain (Klappenbach, 2007). His original works in the country were only two, *Military Psychology* (1950), in which he used his experience in war, and *Psychology and Soccer* (1964), published postmortem, derived from the use of PMK in the selection of players for the Brazilian National Team in the World Cups of Soccer in 1958 and 1962.

For Mira, psychotechnics represented an application of his understanding of the human being as a psychophysical unit, the PMK concretizing this orientation (Miralles Adel, 1979). For its use in Brazil, he had the collaboration of Alice Galland, who took care of the statistical procedures for its standardization and the training of the technicians for its use.

His career has been crowned by numerous awards, from the student period in Spain to posthumous awards in Brazil. His name appears in the census of the main psychologists of the world conducted by Annin et al. (1968).

Emilio Mira y López left his mark on several moments in the history of psychiatry and psychology. In the specific case of Brazil, Argentina, and Uruguay, the role he played in the dissemination of psychology and in bringing Brazilians closer to the psychology that took place worldwide was, without a doubt, his main mark.

School diagnosis · High abilities

In 1946, Maria Helena Novaes Mira, at the age of 19, graduated in philosophy and languages from Universidade Santa Úrsula, USU (Saint Ursula University), Rio de Janeiro, and completed her course on *Historical and Artistic Museums* that same year at the Museu Histórico Nacional (National History Museum). The following year, she spent 6 months visiting art centers and museums in Portugal, Spain, France, Italy, and Switzerland when she became interested in psychology. On her return to Brazil, she found out that a psychology degree program was not yet available in the country. As a result, she chose to specialize in two areas of study: The first one was occupational therapy at the Associação Brasileira de Educação (Brazilian Association of Education), which “provided her with the opportunity to further advance her studies in Biology, Psychology and to acquire practice in the field of

re-habilitation” (Wintter, 1997, p. 84); the second one was developmental psychology at the Instituto de Seleção e Orientação Profissional da Fundação Getúlio Vargas (ISOP/FGV) (Institute of Selection and Professional Guidance of the Getúlio Vargas Foundation).

In 1952, still as a student, Maria Helena initiated a series of research projects in the area of evaluation and testing. In 1956, she traveled to England on a British Council scholarship to work as a rehabilitation intern in English public hospitals. On her return to Brazil, along with Emílio Mira y Lopes, she participated in the creation of the Centro de Testes Psicológicos e Educacionais (Center for Psychological and Educational Testing) in a joint venture between ISOP/FGV and Ford Foundation (1957). This joint effort granted her, during the same year, an internship at the Educational Testing Service of Princeton University in USA and the opportunity to visit reference centers in American universities (University of Illinois in Chicago (UIC); San Francisco State University; and Stanford University in Berkeley, Columbia University in New York). The following year (1958), Maria Helena returned to Brazil and launched the first standardized battery of Educational Development Tests, initiating this way her work focusing on diagnostic activities and professional counseling of adolescents and adults. In the late 1960s, she organized, as a coauthor, *The Glossary of Terms related to Psychological Tests and Measures* (Novaes & Martins, 1969), and in 1969, she published the book *Tests and Models in Education* (Novaes, 1970).

In 1954, along with a team of physicians, Maria Helena participated in the foundation of the Associação Brasileira Beneficente de Reabilitação (ABBR) (Brazilian Beneficent Rehabilitation Association) which aimed to provide specialized care for poliomyelitis victims and those with motor sequelae. From 1957 on, she becomes a faculty member of the Rehabilitation School of the ABBR and, for 20 years, taught psychology at the Escola de Formação de Fisioterapeutas e Terapeutas Ocupacionais (School of Professional Development of Physiotherapists and Occupational Therapists), creating the Centro de Testes Psicológicos e Educacionais

Center for Psychological and Educational Testing at the same institution. During that same period, she organized, along with Therezinha Lins de Albuquerque, the Psychology Bureau at the Escola Guatemala (Guatemala School), an experimental school of the Instituto Nacional de Estudos Pedagógicos (INEP) (National Institute of Pedagogical Studies) and created, within the same school, the Serviço de Orientação Psicopedagógica (Psychopedagogical Guidance Service) where she worked for 11 years (Wintter, 2004). In 1959, she was invited by Father Antonius Benkő to become a faculty member of the Instituto de Psicologia Aplicada Institute of Applied Psychology of the Pontifícia Universidade Católica do Rio de Janeiro (PUC-Rio) Pontifical Catholic University of Rio de Janeiro to implement the course *School Psychology and Learning Problems*. For 40 years, she worked in the Psychology Department of PUC-Rio, where she coordinated the Núcleo de Estudos e Ação sobre o Menor (NEAM) (Center for Studies and Actions on Minors), and in 2004 was awarded the title of Professor Emeritus.

In 1960, Maria Helena returned to Switzerland to do a specialization course at the University of Geneva, a decision that proved to be key both for her doctoral dissertation "*Creativity with children*" as well as for her postdoctoral teaching degree thesis "*Adaptive modalities of school behaviors*" (1974). Her work on children creativity was further developed in a book (Novaes, 1986), and both research studies were defended at the Universidade Federal do Rio de Janeiro (UFRJ) (Federal University of Rio de Janeiro), where she had been teaching since 1960 (de Alencar, 2008). In 1978, she returned to the Center of Genetic Epistemology, at the Jean-Jacques Rousseau Institute, in Genève, for a postdoctoral fellowship with researchers such as Barbel Inhelder (1913–1997), Robert Dottrens (1893–1984), André Rey, and Jean Piaget himself (1896–1980); this was followed by another postdoctoral fellowship, this time at the Laboratory of Child Psychobiology of the University Paris V, with René Zazzo (1910–1995) and Bianka Zazzo (1915–2007). These studies inspired Maria Helena to create an interpretative model of

pedagogical action, presented in the book *Pedagogical Psychology*, published initially in 1982 (Motta, 1999).

Maria Helena worked as a consultant from 1973 to 1989, at the Centro Nacional de Educação Especial (CENESP) (National Center for Special Education), linked to the Ministério de Educação e Cultura (Ministry of Education and Culture), coordinating research studies and projects in the area of gifted and talented students. From 1974 to 1978, she was president of the Associação Brasileira para Superdotados (Brazilian Association for the Gifted) (Novaes, 1979). The experience with children suffering from dysrhythmia, hyperactivity, and neurological deviations at the Centro de Orientação Juvenil (COJ) (Youth Orientation Center) of the Instituto Fernandes Figueira (IFF-FIOCRUZ in 1978) (Fernandes Figueira Institute) in Rio de Janeiro consolidated a genuine interest in gifted children. She created an emotional literacy program with preschool children in the community of Rocinha (Rio de Janeiro) based on Daniel Goleman's (1946–) theory of emotional intelligence, which aimed at providing funding to schools to deal with "well-endowed children." The program generated a sophisticated "reference matrix for the development of potentialities of children with high abilities" (Novaes, 1997).

In the field of developmental psychology, Maria Helena contributed with research involving both children and the elderly. From 1996 until her death, she devoted herself to the "Programa de Ativação Cerebral Criativa" (PACC) (Creative Brain Activation Program), defending the importance of intergenerationality, the interaction between generations, and the conception of aging as a transgenerational passage. She developed techniques for the prevention of memory deficiency in the elderly, working with groups of elderly people of various socioeconomic groups and ages, winning the competition "Proposals for a university in the third millennium" sponsored by the Fundação Universitária José Bonifácio (FUJB/UFRJ) (José Bonifácio University Foundation) with her work "*The university in the third millennium: an imagined turnaround*." This paper reflects on the contradictions, uncertainties, and

complexities of today's society, themes discussed in the book "*Contemporary Paradoxes*" published in 2008. This book completes a previous one called "*Commitment or alienation facing the next century?*" (Mira, 2000).

In an interview to Geraldina Witter in 1997, Maria Helena pointed out that she participated in the commission that presented the project that "regulated the profession of psychologist (Law 4.119) at the National Congress which defended the specificity of the contributions of the psychology professional."

Dr. Novaes received the medal of the National Order of Educational Merit twice (1994 and 2001) from the Presidents of Brazil, and in 1998, she was Honored Professor at the VII Symposium of Research and Post-Graduation in Psychology by the Associação Nacional de Pesquisa e Pós-Graduação em Psicologia (ANPEPP) (National Association of Research and Post-Graduation in Psychology). Creative and with an innovative mind, she leaves a legacy of new ideas reflected on her scientific research studies, the training and development of new researchers, awards, and a vast academic production, composed of many books, sometimes reedited and translated into other languages, book chapters, and articles, almost all published in the *Arquivos Brasileiros de Psicologia Aplicada* (ISOP/FGV) (Brazilian Archives of Applied Psychology).

Miret Monsó, Josep

Born *Barcelona (Spain)*, 14 July 1918

Died *Barcelona (Spain)*, 7 January 1995

Virgilio Ibarz

Universidad Ramon Lull, Barcelona, Spain

Keywords

Spain · Venezuela · Adolescence · Psychiatry

José Miret Monsó was a Spanish psychiatrist. He studied high school at the Balma Institute. He began medicine, but the Civil War interrupted its studies. He showed his interest in psychiatry and, during the time that the Facultad de Medicina (Faculty of Medicine) was closed, he attends as an intern at the Dispensary of Psychiatry of the Medical Clinic, directed by Agustí Pedro Pons (1898–1971) at the Hospital Clinic de Barcelona. During the last years of his degree, he attends as an intern at the Psychiatric Clinic of Joaquim Fuster Pomar (1901–1982).

In 1946, Miret began to work at the Institut psicotècnic (Psychotechnic Institute) de la Mancomunidad de Catalunya (Barcelona Provincial Council) and was responsible for the Characterology Section. This institution (with international prestige) had been directed, before the Civil War, by Emilio Mira y López (1896–1964).

In 1953, Miret moved to Venezuela hired by the Universidad de los Andes, in the city of Mérida. Olivér Brachfeld had founded the Instituto de Psicosisíntesis y Relaciones Humanas (Institute of Psychosynthesis and Human Relations) at the Universidad de los Andes (Universidad de los Andes) where Miret held the chair of Psychiatry. However, at the end of the

1953–1954 academic year, the Institute was closed and Brachfeld returned to Spain. Miret remained in Venezuela and, in Mérida, he validated his medical degree and later obtained Venezuelan nationality.

Since 1954, he was professor of the chair of Psychiatry, adjunct professor of clinical semiology, and visiting professor of Anthropology at the Faculty of Humanities. He remained in Mérida until September 1957. In 1958, he was hired by the Universidad Católica Andrés Bello (Andrés Bello Catholic University) of Caracas to take over the chairs of General Psychology and Differential Psychology. Later he was appointed dean of the Facultad de Psicología (Faculty of Psychology) of the Andrés Bello University. Miret was appointed president of the “Cercle Català” of Venezuela in 1969.

Miret remained in Caracas from 1958 to 1982, holding these chairs. In 1967, he won the Carles Gardó prize for his work *La autoridad paterna y el entendimiento con los jóvenes* (Paternal authority and understanding with young people), published in 1970, in which he addresses the problem of tensions between generations. It exposes the mentality of the generation of young people of the 1930s in Spain, the “burned generation” after the Civil War and the generation of the 1960s. The time in which we live, states Miret, requires a new dialogue in the substance and the form. The “principle of authority” must be proscribed as being counterproductive. On the contrary, there must be a concern to establish a new ethic of dialogue and growth.

From 1973 to 1975, he was a professor at the Universidad Central de Venezuela (Central University of Venezuela, UCV) in Caracas and taught graduate courses, especially on adolescent psychology. He also collaborated with other Venezuelan institutions such as Instituto Universitario de Nuevas Profesiones [University Institute of New Professions] and Universidad Nacional Experimental Simón Rodríguez [Simón Rodríguez National Experimental University] with courses on sexology, drug addiction, and alcoholism.

In 1975, he presented his doctoral dissertation at the Universidad de los Andes *Psiquiatría y Psicología Clínica: confluencia y delimitación*

de campos y funciones profesionales (Psychiatry and Clinical Psychology: confluence and delimitation of fields and professional functions). In 1981, he won the Martí Julià prize for his work *Contribució a l'estudi de la imatge psicològica de la pell* (Contribution to the study of the psychological image of the skin), published in 1986.

Miret developed in Venezuela some jobs that he had started at the Barcelona Psychotechnic Institute. Many young people passed through this center to do professional orientation. Another facet of Miret's work in Venezuela is his publications on characters from the history of literature. His works on Goethe, Schiller, Manzoni, or Amado Nervo, published as book chapters of a literary collection from the years 1944–1946, stand out. He also published extensive works on Freud from 1954 to 1956.

In 1954, he published *Consideraciones médico psicológicas sobre la brujería y el curanderismo* (Medical-psychological considerations on witchcraft and quackery), a book which includes a series of articles published in the journal *Profesiones Médicas* (Caracas). In 1972, in Caracas, he published a book on the face, expression, and gesture, with photographs, and in 1987, a historical paper on astrological typology to the vector typology, a descriptive work, which connects with Miret's dedication to characterology at the Psychotechnic Institute from Barcelona. In the University of Los Andes, Miret had met Lluís Noguer y Molins (1886–1972), a medical doctor who was in Mérida from 1944 to 1958 and was an important figure of the local Faculty of Medicine.

During the years of stay in Venezuela, Miret publishes more than 30 works and articles on family mental hygiene, Szondi and Wartegg tests, and psychological problems of children and young people.

At the beginning of the 1980s, he regained Spanish nationality. On September 28, 1982, Miret returned to Barcelona. He dedicated himself to private practice and to researching in the history of medicine, especially Catalan physicians who had to go into exile. In 1992, he was appointed a corresponding member of the Royal Academy of Medicine of Catalonia. In the last Congress on the History of Catalan Medicine that Miret was able

to participate in, in 1994, he presented the theme “The Psychotechnic Institute of Barcelona (1914–1986),” where he emphasized that this institution was solid, balanced, and active.

Miret had an important role in the beginnings of psychology in Venezuela with his historical and literary-psychological studies, but also with his emphasis on nonverbal behavior.

 Psychological tests

Óscar Miró Quesada de la Guerra was a Peruvian intellectual best known by his journalistic pseudonym, “Racso.” He studied at the *Universidad Nacional Mayor de San Marcos* (National University of San Marcos, UNMSM, Lima), where he obtained the degree of Doctor of Letters (1910) and Doctor of Law (1911). In his *alma mater*, he taught sociology (1910–1912), pedagogy (1913–1914), criminal law (1915–1917), and criminology (1918–1929).

He is considered the pioneer of science journalism in Peru. His work deserved the recognition of Albert Einstein (1879–1955) for his articles on relativity (Miró Quesada, 1985). While in Europe between 1904 and 1908, he attended the *Sorbonne Université* [Sorbonne University, Paris] as a free student and was especially interested in the psychology laboratory of Alfred Binet (1857–1911), the creator of the intelligence scale that bears his name. In psychology, he opted for the experimental approach. He also highlighted the rise of psychological testing in the United States and was also an early diffuser of Freudian ideas in Peru.

Starting in 1923, he directed the Departamento de Antropología Crimninal (Department of Criminal Anthropology) of the Facultad de Derecho (Faculty of Jurisprudence) at UNMSM, which had a small experimental psychology laboratory equipped with psychological tests such as those of Binet and Yerkes intelligence, a taquitoscope, a scale of pressures, and a thermal suggestor among others. This team also served for Miró Quesada to act as a criminologist expert evaluating the inmates of the Lima prison (García, 2011).

Mainly concerned with the dissemination in Peru of scientific advances and new philosophical trends, Miró Quesada frequently used the pages of the newspaper *El Comercio* (owned by his family) also to deal with psychological issues or to invite specialists in psychology and psychiatry to write articles on their respective disciplines, such as Honorio Delgado (1892–1969) (Miró-Quesada, 1985).

Molina Avilés, Jorge Orlando

Born in Mérida, Yucatán, México, on April 30, 1944

Gabriel Vázquez Fernández
Department of Professional Education, National Autonomous University of Mexico, Mexico City, Mexico

Keywords

Mexico · Critical Marxist psychology · History of psychology

Jorge Molina Avilés is a figure who stands out in the events that gave “life and identity” to the Facultad de Psicología (Faculty of Psychology) (FP) at the Universidad Nacional Autónoma de México (UNAM, National Autonomous University of Mexico) and to the discipline as a profession in Mexico. He was born to a provincial, extended, and well-educated family. His father, Max Molina, was a primary and secondary school teacher whose leftist political ideology led him to a confrontation with the State Governor and had to move his family to Mexico City when Jorge was 15 years old. In 1961, Jorge Molina started high school at the Preparatoria 5 (Preparatory School Number 5) at the UNAM, his alma mater and workplace to date. In 1964, after pondering between his love of biology and psychology, he entered the Colegio de Psicología (College of Psychology) of the Facultad de Filosofía y Letras

(Faculty of Philosophy and Literature (FFyL)) at the UNAM. His peaceful and amiable character, as well as his inclination for active participation, led him to immediately join a group of older students and some of his own generation, who identified themselves by their interest in scientific psychology and would later have a profound influence in other students.

His first 2 years of his professional training were a time of academic commitment and discovery of scientific psychology and learning theories, interrupted by a university strike in 1966 fueled by an academic reform proposed by Ignacio Chávez Sánchez (1897–1979), rector of the University. Paradoxically, the political conflict at the University favored an academic movement inside the FFyL that gave rise to a profound and radical change in the teaching and practice of psychology. At the time, the principal demand of the students and some professors was a new curriculum, but the idea that it was necessary to separate psychology from the FFyL to pursue the development of scientific psychology took over.

In the late 1960s, the UNAM and other universities in Mexico were in turmoil. For many psychologists, it was a preamble to a distinguished and productive academic or professional career. It was also a preamble for the founding of the FP in 1973.

A select group of students showed the interest in scientific psychology and searching for a more suitable environment for it; moved to the Universidad de Veracruz (Veracruz University) in Xalapa, Veracruz; and later left the country to pursue graduate studies abroad. The students who remained at the UNAM, accompanied by an outstanding group of professors, were the principal instigators of the events that transformed Psychology in Mexico. Jorge Molina was one of those students.

In 1969, Jorge Molina obtained his licentiate in psychology degree, and a year later, he and Héctor Enrique Ayala Velázquez presented the first case of behavior modification in Mexico at the XIX International Congress of Psychology in London, England. In 1975, Jorge Molina, Benjamín Domínguez (born in 1947), and Gloria Silvia

Macotela Flores (1947–2006) organized the III Congreso Latinoamericano de Análisis de la Conducta (III Latin American Congress of Behavior Analysis), presided by Jorge Molina with Frederic B. Skinner (1904–1990) as special guest and honorary president. This was the only occasion in which B. F. Skinner visited Mexico.

In 1971, Jorge Molina made his first trip to the Republic of Cuba and returned inspired and motivated to delve in the study of Marxist psychology.

Later on, his academic endeavors would take him to the study of human information processing, to the history of psychology in Mexico, and eventually to his current academic interest in social constructivism and postmodern and systemic psychotherapies.

From 1974 to 1977, Jorge Molina served as the head of the Experimental Psychology Unit, his first administrative job at the UNAM. Later on, as the head of the División de Estudios Profesionales (Professional Studies Division) of the FP (1980–1984), he organized a series of academic meetings and student exchanges as part of the Encuentro de la Psicología México-Cuba (Mexico-Cuba Psychological Meeting), in collaboration with the Facultad de Psicología (Faculty of Psychology) at the Universidad de La Habana (University of La Habana), and travelled extensively to the Caribbean and Central America establishing contact with many psychologists of the region that subsequently would visit Mexico. In this period, Jorge Molina starts writing about the history of psychology in Mexico.

From 1985 to 1989, he headed the División Universidad Abierta (Open University Division) of the FP at the UNAM and repeated at this post again in 2004 and 2018. In 1974, he was elected to the first Consejo Técnico (Academic Council) of the FP and in 1976 to the first Consejo Técnico of the Escuela Nacional de Estudios Profesionales Zaragoza (Academic Council of National School of Professional Studies Zaragoza) at the UNAM.

The critical exploration of new theoretical perspectives in psychology and an immovable commitment to social justice shaped the long road that took Jorge Molina Avilés from behaviorism to the

development of a dialectic-materialistic psychology, to his interest in the history of psychology in Mexico, and to his current interest in systemic approaches to therapy.

In a broad sense, the plurality of Jorge Molina Avilés' academic and professional career of more than 50 years mirrors the vicissitudes of the evolution and plurality of the FP at the UNAM.

Molina Garmendia, Enrique

Born *in La Serena (Chile) on August 4, 1871*

Died *in Concepción (Chile) on March 8, 1964*

Elizabeth Pardo-González

Universidad Católica del Maule, Talca, Chile

Keywords

Chile · Educational psychology · Educational guidance · Pedagogy · Philosophy

Enrique Molina was born in the city of La Serena. Enrique's primary education began at *Colegio de Preparatorias de Pedro Boyle* (Pedro Boyle High School) and continued at *Escuela Pública Superior* (Public High School), directed by Mariano Araya. He later entered *Sección Preparatoria del Liceo de Hombres de La Serena* (Men's High School of La Serena) and *Escuela Pública de Niñas* (Public Girls' High School) of Juana Nepomucena. He then returned to the Men's High School of La Serena, where he completed his humanities studies. In 1887, he entered law school at *Universidad de Chile* (University of Chile), although he later entered the *Instituto Pedagógico* (Pedagogical Institute), where he obtained a degree in history and geography, before graduating as a lawyer. His life represented an open humanism, and his work focused on the areas of education, psychology, philosophy, and sociology (Molina, 1974; Ossandón, 2016; Oyarzún, 1964). Throughout his career, he held several different positions. He was rector of *Liceo de Hombres de Talca* (Men's High School of Talca) and *Liceo de Hombres de Concepción* (Men's High School of Concepción); was appointed rector for life of *Universidad de Concepción* (University of Concepción); served

as Minister of Education between 1847 and 1848; and was a member of the *Facultad de Filosofía* (Faculty of Philosophy) at the University of Chile (Bazán, 1954; Molina, 1974).

Molina pointed out the relevance of the knowledge of psychology in the teaching profession (Molina, 1974), and he gave great importance to the role of the teacher as a counselor and trainer of values and morals in young people (Molina, 1906). He stated that the bases of almost all the most transcendental problems found a solution in the principles of psychology, logic, and sociology. Molina considered it important to achieve an assimilation of basic notions about the functions of intelligence, will, feelings, and social evolution. The fact that such teaching was not carried out in Chilean education was particularly sensitive, since, without it, young people received an incomplete education (Molina, 1907; Villalobos, 2016). It is important to note that he showed great concern about the lack of guidance for young people, a situation that caused them to graduate with a moral void, without volition and character (Molina, 1912).

In his text *Educación Contemporánea* (Contemporary Education), he raised the need to incorporate the study of psychology and morality, as well as gathered critical reflections on the importance of personality in education and social life (Molina, 1914). Advances in psychology and pedagogy, mainly in the United States and Germany, led Molina to consider and enhance the value of individuality in education. In his opinion, a teacher should take the attitude of an open-minded psychologist in order to understand the complexities of the soul, since it is not possible to consider students as a uniform mass susceptible to being cast in a single mold (Molina, 1914). In this sense, he enhanced the relevance of child psychology in the construction of character and individuality. On the other hand, he incorporated the explanations of Jean Martin Charcot (1825–1893) and Alfred Binet (1857–1911) regarding psychological evaluation and mental pathologies. At the same time, Molina emphasized the importance of determining the types of abnormal children for pedagogy, and he considered that this approach avoided the application of

useless, counterproductive, and often cruel procedures. Abnormal children could be abnormal pathologically due to lack of intelligence, or pedagogically, if they had acquired instruction inferior to that which corresponded to their age (Molina, 1914). Additionally, he recognized the lack of establishments and specialized teachers to work in the field of special education (Molina, 1912).

Between 1918 and 1919, on behalf of the *Gobierno de Chile* (Chilean Government), he visited universities in the United States. At the University of Wisconsin, he met Joseph Jastrow (1863–1944), and at Harvard University, he visited the Psychology Laboratory founded by William James (1842–1910). Molina reported that, during his stay, he was able to appreciate the efficiency and advanced nature of the psychology departments he visited. He analyzed, in turn, the reality of education in Chile and concluded that it was following the example of German and French universities, where it was presumed that young people had reached the necessary maturity to know how to self-manage; however, on many occasions, they were overwhelmed and disoriented. In the United States, on the other hand, students were given careful, affectionate, and very accurate attention, with concern for their health, morality, exercise, and entertainment. The situation in Chile worsened when teachers were kept away from their students, which was understood to happen with teachers who were not university professors by profession, since they were there only to give classes and not to be *psychagogues*, that is, conductors of souls (Molina, 1921).

In one of his speeches, at the inaugural session of the *V Congreso Científico* (V Scientific Congress) organized by the *Sociedad Científica de Chile* (Scientific Society of Chile), Molina stated that psychology was one of the sciences whose lack of flourishing was notorious in Chile. For him, psychology was the science of the soul, studying people's intelligence, feelings, passions, and character. The different branches of psychology allowed for detailed study of the soul of children and men, making it useful not only for

education, but also for setting new directions for the social sciences and enriching their methods through the psychology of peoples, i.e., the study of the common elements of race, feelings, and beliefs of a nation (Molina, 1974).

In summary, beginning in the first decades of the twentieth century, Molina provided important reflections that led to the construction of an incipient educational psychology, necessary for the construction of character, the recognition of individuality, the orientation and formation of values of children and young people, and other essential elements in education (Molina, 1906; Molina, 1974).

Ana Molina Peralta was the daughter of Antonio Molina Azpéitia (1916–1996) and Ana Peralta León (1908–2001), Spanish republican refugees in France at the end of the Spanish civil war, in 1939. They lived in that country until March 1948 when they emigrated to Venezuela, at which time she was 7 years old.

It was in Venezuela where she attended her elementary and high school, and later the Universidad Central de Venezuela (UCV) (Central University of Venezuela), where she graduated with a degree in Psychology in 1962, the third graduating class of a still nascent undergraduate program.

Parallel to the formal academic plan of the Escuela de Psicología (School of Psychology), she was trained as a psychotherapist; she sought a career in the study of Psychoanalysis; however, she faced, at first, the prevalence of psychiatric and positivist approaches, which led her to emphasize the need to train students in the Psychology undergraduate program, with the guarantee of a representation of the psychological models of the time.

She worked as an undergraduate professor at the School of Psychology of the UCV between 1963 and 1989. She lived in her academic life, the moment of greatest effervescence regarding the curricular changes of the preliminary studies program, as well as the raid of the UCV (1969), during the first presidency of Dr. Rafael Caldera (1969–1974). She was assigned to the Chair of Differential Psychology (1962–1963), to the Chair of Clinical Psychology (1964–1969) of the

Department of Clinical Psychology, to the Chair of Clinical Practices (1969–1975), of Theories in Clinical Psychology (1976–1989), and of Clinical Child Psychology (1969–1989) in the same Department. In addition to teaching required courses, she developed a syllabus for elective courses related to the approach to children, with clinical practice under the dynamic approach and the course Psychology of Health, which she taught from 1985 to 1988.

As a professor, special mention should be made of the first Dynamic Clinic undergraduate training project (1977), which gave way to the consolidation of the current Dynamic Clinic option in the School of Psychology at the UCV. She maintained the applied field as a core formative element, hence the imprint that marked her teaching practice, which is reflected in her expression “... Students must do applied for work, accompanied by teachers, from the first moment and see the usefulness of what they do, hence the need for the teacher to have his identity and give the student the freedom to define his own....” (Prieto Rodríguez, 2021, 8m1s; translation is mine).

As a postgraduate professor, she organized and coordinated the hospital postgraduate program *Residencia Programada en Psicología de la Salud* (Programmed Residency in Health Psychology), between 1987 and 1999, considered the first postgraduate program with these characteristics in Venezuela and genesis of the subsequent foundation of the Sociedad Venezolana de Psicología de la Salud (Venezuelan Society of Health Psychology) of which she was founder and first president (1990). She also collaborated with the Specialization courses developed by the Facultad de Medicina (Faculty of Medicine) of the UCV in Pediatrics and Child Care (1977–1987), was a teacher of the Specialization Course in Critical Medicine in Pediatrics (1981–2005), in Nursing (1984–2005), and the Specialization Course in Clinical Psychology (1991–2005) of the Facultad de Humanidades y Educación (Faculty of Humanities and Education) of the same University. In 2008, she was responsible for the Curso Introductorio a la Salud Mental (Introduction to Community Mental Health

Course) for mental health professionals and community leaders under the auspices of the Alcaldía Mayor de Caracas (Mayor's Office of Caracas), Venezuela.

In the health care field, since 1972, she worked as a psychoanalytically oriented psychotherapist in public institutions and in private practice; she worked as a psychologist in the Albergue Central del Consejo Venezolano del Niño (Central Shelter of the Venezuelan Children's Council) (1966–1973) and in the Hospital de Niños Jose Manuel de los Ríos (Children's Hospital José Manuel de los Ríos, Caracas) (1961–1998). She was also attached to the Servicio de Terapia Intensiva Dr. Xavier Mugarra (Intensive Care Service Dr. Xavier Mugarra) of the same center from 1980 until her retirement in 1998; however, she continued as a volunteer until 2006. She was also co-founder of the Oficina Nacional de Denuncias del Niño Maltratado (Fondenima) (National Complaints Office for Abused Children) in 1983 and remained as an advisor from 1998 until 2002.

She published as a co-author in 1983, on the first case detected in Venezuela of Munchausen's Syndrome by Proxy. She is a member of the Sociedad Psicoanalítica de Caracas (Psychoanalytic Society of Caracas) and still practices as a psychotherapist. In recognition of her work as a Hospital Psychologist, her name was given to the Servicio Autónomo de Psicología Clínica y de la Salud (Autonomous Service of Clinical and Health Psychology), which operates at the Hospital Jose María Vargas (José María Vargas Hospital) in the city of Caracas and also Award XIX Jornadas Nacionales de Pediatría y Puericultura Dr. Oscar Mayz Vallenilla (1992) and Honorable Mention Dr. Luis Ceballos: VI Congress of Burns (1997).

Fernanda Monasterio was a Spanish medical doctor and psychologist, which made an important contribution to the processes of the institutionalization of the degrees and profession of psychologist in Argentina.

She was born into a family whose father, Fernando Monasterio, was a member of the Spanish Army. He had to move to the city of El Ferrol, Galicia, for a few years, and then came back to Madrid. This is where the young girl did most of her studies. She was a high schooler as an internal student in a private religious school, but when she was 16 the Spanish Civil War took place (1936–1939), and, at its end, as a result of the war, her father, who had been an officer in the defeated Republican army, had to flee with the whole family first to France and then to Mexico, where they settled. Nonetheless, the young girl chose to come back to Spain for her medical studies which she had chosen at an early age, and became a student at the Universidad Central de Madrid (Central University of Madrid, now Complutense) where she graduated as a physician in 1941.

She became a doctoral student of the famous Spanish clinician Gregorio Marañón (1887–1960), both a great endocrinologist and a great humanist and essayist. This largely influenced her. Under his direction, she wrote an MD thesis on “Depressive symptoms in acromegalic disease” (1945). She then cultivated the psychiatric and psychopathological fields, collaborating with Jose Germain (1897–1986), a well-known psychiatrist and psychologist who had done important work on psychotechnics in the 1930s, and was then initiating a group on applied psychology in the country, which in the long run would pave the way for an updated Spanish contemporary scientific psychology (Carpintero, 2007). But in the 1940s and 1950s, she did not find a job that would satisfy her interests in combining clinical work and teaching delicacy in medicine. Then, after some failed attempts, and according to the advice of her teachers, she was forced to move herself to the Latin American countries, in search of such a desirable opportunity.

Many years later, she explained the reasons to move to the American continent: “Well, there were some reasons. First, my parents were there, and,

moreover, in Spain there hadn’t in those days been a program in psychology” (Dagfal, 2011, p. 39)

In 1952, Fernanda Monasterio moved to the Universidad de Cochabamba (University of Cochabamba) in Bolivia, where she entered as a professor of physiology, filling a vacant post left by the Spanish doctor Augusto Pi Suñer (1879–1965). Two years later, she moved to Argentina, the country in which her family gathered together anew. She spent a short period at the University of Cuyo, replacing there Dr. Horacio Rimoldi (1913–2006), who had left for the USA; then she changed to the Universidad Nacional del Sur (National University of the South) in the city of Bahía Blanca, and got in contact with the Universidad Nacional de La Plata (National University of La Plata), where she received an important support from Alfredo Calcagno (1891–1962), a very distinguished professor of education who had joined that university in substitution of Victor Mercante (1870–1934), a great educator pioneer in that university (Dagfal, 2009). The time was ripe for new developments; the Peron’s Era had come to an end, and a period of new freedom for the intellectual world of the country had begun.

In those days, the movement toward the creation of a degree in psychology was growing, and had received a great impulse at the First Argentinian Congress of Psychology that took place in Tucumán in 1954 (Klappenbach, 2000). Such an interest had also grown in La Plata. First, an Institute of Psychology was established, to care for those clinical aspects which were always present in educational activities. Monasterio obtained there a job, and was in charge of a course on “Psychology of childhood and adolescence.” From there, she was able to enlarge the activities of the Institute, and eventually a committee was implemented to design a curriculum for a professor of psychology. It was composed by three Spanish emigrants – Juan Cuatrecasas (1899–1990), who was teaching anthropology there; Angel Garma (1904–1993), a psychoanalyst who largely contributed to the process of institutionalization of this movement in Argentina, and Fernanda Monasterio herself – along with two local professors – Calcagno and Luis María Ravagnan (1902–1984) (Quintana & Feldman, 2007).

In 1957, the first steps were taken toward the creation of a chair and a degree in psychology. The following year, in 1958, there was a contest to name a professor that would be in charge or organizing these new studies. Two people applied for the job: Angel Garma, who conceived the degree according to a psychoanalytic model, and Fernanda Monasterio, who built her program according to a model of psychology as a natural and empirical science. This later one was selected, and in consequence, she was charged with the task of creating a career in psychology for the university. She introduced in it a high degree of professionalism, and conceived the individual's psychobiological development as its core dimension, clearly related with the educational needs of the institution. In some documents, she defined psychology as the "study of behavior and personality," far from psychoanalytical thought; she was always in favor of an academic and systematic science of human psychism.

Some well-known professors joined the new department: Luis María Ravagnan, Nuria Cortada (1921–2013), and Juan Carlos Pizarro, among others. Great attention was paid to educational and work psychology, and the clinician was mostly conceived as a collaborator for the medical doctors, who had mainly to focus on assessment and verbal psychotherapies.

During that time, she, as a member of the Sociedad Argentina de Psicología (Argentinian Psychological Society), was able to organize and chair the Eighth Congress of the Interamerican Society of Psychology (SIP), at the city of Mar del Plata (Argentina) in 1963. This was a success, and new support was garnered to its organizer (Carpintero, 2012). Nevertheless, at that time, the psychoanalytic movement was continuously growing, and its ideas and concepts were inspiring more and more the teachings of the psychological department in La Plata. In the end, Monasterio felt herself without support as its director, Calcagno, who had been always a firm defender of her work, had moved to UNESCO in Paris, and his support was then missing. In 1966, she finally resigned and ended her career at La Plata, and also in Argentina.

Coming back to Spain, she maintained a private clinical activity, with occasional participation

in scientific and social events at the Spanish Psychological Society. She considered herself as an anthropologist, always focusing on the human person. She also was a member of an association of humanistic doctors, contributing with some essays to its meetings. She felt herself close to feminist movements, although she lived as an independent person until her final days. She left a personal work, interesting but not very extensive, and without great recognized disciples.

Monefeldt Müller, Malvina Louise

Born *Mayagüez, Puerto Rico, 26 December 1892*

Died *1 June 1967*

Vivian E. Olivera Santiago
Department of Psychology, University of Puerto Rico, Río Piedras, San Juan, Puerto Rico

Keywords

Puerto Rico · Educational psychology · Psychological testing

Malvina L. Monefeldt was the daughter of Jens Alexander Gerbhardt (also known as Gerdard Monefeldt), a British viceconsul born in Denmark, and Adriana J. Müller born in Saint Croix, Virgin Islands. Malvina Monefeldt studied in the public schools of Puerto Rico in Mayagüez and entered the University of Puerto Rico where she obtained a normal diploma in 1912.

As soon as she graduated, Malvina Monefeldt started working for the Department of Public Education of Puerto Rico first as a rural teacher and later as principal and supervisor. She worked for this agency from 1915–1919. In 1919, she moved to Río Piedras, Puerto Rico, and started working until 1926 as a critic teacher in the Practice School of the University of Puerto Rico (today *Escuela Elemental de la Universidad*, Elementary School of the University of Puerto Rico). She was then hired as an instructor at the Department of Education of the University of Puerto Rico in Río Piedras. Studying during the summer sessions, she earned a bachelor's degree in science at Columbia University in 1927, then a master's degree in Education in 1930, specializing in psychology of children and adolescence.

In 1927, Malvina Monefeldt was hired as a professor at the University of Puerto Rico, Río Piedras Campus (UPR-RP), where she worked until 1962 when she retired, but continued teaching part-time until 1963. She taught a diversity of psychology courses, including psychology of children and adolescence. From 1937–1939 she also offered psychological counseling services at both UPR and St. John's School, where she also spent 2 years administering psychometric tests (Personnel Record, 1919–1963).

Malvina Monefeldt was one of the pioneers in psychological testing in Puerto Rico. She worked with Dr. Fred Walters (1879–1962), Prof. Alfredo Silva (1897–1980), and Ms. Mercedes Chiqués Walsh (1893–1976) on the translation of Stanford Binet in 1933 and in the development of *Test Hispanoamericano de Habilidad y Logro, para grados 3–12* (Spanish-American Test of Skills and Achievement, for grades 3–12) (Álvarez, 2006; Roca de Torres, 2007). They constructed six forms of *Test Hispanoamericano de Habilidad y Logro* (Hispanoamerican Test of Skills and

Achievement) for high school students. This same group of researchers translated the 1916 edition of the Stanford-Binet Intelligence Test. Their translation was the one used in Puerto Rico to evaluate our children until Pablo Roca de León (1951, 1953) published his translation and adaptation of the Wechsler Intelligence Scale for Children (1949) and the 1937 edition of the Stanford Binet Intelligence Scale for Children (Roca de Torres, 2007).

In 1961 the University of Puerto Rico granted to Prof. Malvina L. Monefeldt the title of *Professor Emeritus*, the highest honored bestowed by the UPR-RP to retired professors (Personnel Record, 1919–1963). She was an active member of *Asociación de Psicólogos de Puerto Rico* (Puerto Rico Psychology Association, APPR) and American Association of University Professors.

Montero Rivas, Maritza

Born in Caracas, Venezuela, November 11, 1939

Juan Carlos Canga Linares
Federation of Psychologists of Venezuela (FPV),
Central University of Venezuela (UCV), Caracas,
Venezuela

Keywords

Venezuela · Community social psychology ·
Political psychology

Maritza attended elementary and high school in Caracas, and at the age of 16, she began her university studies at the Universidad Central de Venezuela (UCV) (Central University of Venezuela). Her first degree was in Law, as was the tradition in her family. She graduated as a lawyer in 1962, but her interest in the life situation of people motivated her to study psychology, obtaining her degree in 1967.

In 1968, after graduating as a psychologist, she participated in a competition for credentials at the Institute of Psychology of the UCV, where she was finally selected, thus beginning her long career as a researcher. Shortly thereafter, she was offered to teach at the School of Sociology and Anthropology of the UCV. From that moment, she alternated her activities as a researcher and professor of the courses “General Psychology” and “Social Psychology.”

Her first research works from the School of Sociology and Anthropology were in the psychopolitical area: The first was an electoral survey in the city of Caracas in 1972, during the electoral campaign for the presidency won for the period 1989–1993 by Carlos Andrés Pérez (1922–2010); later, another survey on the political socialization of young Caracas residents, their forms of political decision, and the influences received.

Another of the relevant experiences he developed in the academic field was the fieldwork on cultural anthropology carried out in Guajira between 1972 and 1973. Several students, anthropology professors, and the psychologist Ileana

Recagno (1931–2015), a specialist in evolutionary psychology and who tested certain psychological tests that were translated into the Wayúu language, participated. In 1976, she developed a line of research on the national identity of Venezuelans, using as a reference the works on the nationalism of Professor José Miguel Salazar.

In 1979, for the Congress of the Sociedad Interamericana de Psicología (SIP) (Interamerican Society of Psychology) in Lima, she organized a symposium on aspects of social psychology, promoting the creation of the Community Psychology Committee. From that moment, she began to develop her theoretical approach to community psychology, inspired by the book of the Colombian sociologist, researcher, and writer Orlando Fals Borda (1925–2008), entitled “Communal action in a Colombian village: its application, its results, and its interpretation” (Fals-Borda, 1961). This work was published in 1980 and ended up becoming the first work of Venezuelan community psychology and one of the main definitions of community psychology, a contribution that is still valid today (Montero, 1984).

She obtained her master’s degree in psychology at the Universidad Simón Bolívar (USB) (Simon Bolivar University), where she received her degree in 1979. Subsequently, she began doctoral studies at the UCV. However, thanks to an agreement between the UCV and the University of Paris, she moved to Paris, France, where she completed her doctoral studies in Sociology at the L’École des Hautes Études en Sciences Sociales (School of Advanced Studies in Social Sciences) de Paris, obtaining her PhD in sociology in 1982.

It is worth noting that Prof. Montero, in addition to Spanish as her mother tongue, is fluent in 5 languages: English, French, Italian, Portuguese, and Russian. In parallel to her professional life, she married and had two daughters, one an architect and the other a writer.

Her teaching career began in 1968 at the UCV, where she was Professor of social psychology; Head of the Departamento de Psicología Social (Department of Social Psychology) at the UCV School of Psychology; Directora del Postgrado en Humanidades y Educación (1986–1989) (Director of the Graduate Program in Humanities and

Education); Cofounder of the Maestría en Psicología Social (Master’s Program in Social Psychology) and the Doctorado en Psicología (Doctoral Program in Psychology) at the UCV; and Coordinator of the same until 2006; she is currently a member of the Academic Committee of the Doctoral Program in Psychology at the UCV.

The national and international recognition of her work includes her participation as an invited lecturer in numerous scientific events inside and outside the country. She is a frequent guest lecturer at the most prestigious universities in the world, among which stand out the following: “Andrés Bello” Chair at St. Antony’s College; University of Oxford (1980–1981); Visiting Fellow at the University of London, Centre for Multicultural Education (1989–1990); Maître de Conférences at the Université de Paris VIII (1990); Professor of the Summer Courses in Psychology at the University of Oslo, Norway (2009–2011); and Professor invited by the British Psychological Society to give lectures and seminars at four academic institutions in the United Kingdom: University of London, Cardiff University, Manchester Metropolitan University, and Sterling University (date not yet given). She was a visiting professor at universities and research centers in the following countries: Argentina, Australia, Brazil, Chile, Colombia, Costa Rica, Cuba, Ecuador, France, Germany, Wales, Guatemala, Italy, Mexico, Norway, Palestine, Paraguay, Peru, Scotland, Spain, Puerto Rico, United Kingdom, United States, United States, and Uruguay.

Professor Montero has served on editorial boards of several social and community psychology journals including the following: *American Journal of Community Psychology* (USA), *Annual Review of Critical Psychology* (UK), *Community, Work & The Family* (UK), *Espacios Abierto-Cuaderno Venezolano de Sociología* (Venezuela), *Journal of Community Psychology* (USA), *Psicologia di comunità* (Italy), *Revista de Psicología Social y Política* (Spain), *Revista Salvadoreña de Psicología* (Salvador), *Psicología Social Comunitaria* (Mexico), *Psicología e sociedade* (Brazil), and *Psykhé* (Chile), among others.

She belongs to more than 10 scientific associations and has participated in 26 Evaluation Commissions. She has held prominent positions, among which stand out the following: Founding Member of the Asociación Venezolana de Psicología Social (AVEPSO) (Venezuelan Association of Social Psychology) in which she was its President between (1978–1980) and (1983–1986); International Society of Political Psychology where she was Member of the Governing Council (1989–1991 and 1996–1998) as well as President (2005–2007); member since 1987 of the Society for the Psychological Studies of Social Issues (SPSSI); General Coordinator of the Commission of Community Social Psychology (1995–1997), Vice-President for South America of the SIP (1997–1999), and President of the XXVII Inter-American Congress of Psychology, Venezuela (1999); Member of the Network of Information and Scientific Documentation in Mental Health and Human Rights, Member of Radical Psychology since 1993; Member of The New York Academy of Sciences (1994–1997); Member of the Society for Community Research and Action, Division 27 of the American Psychological Association, Coordinator of the International Committee (2003); Honorary Member of the Peruvian Forum of Social Psychology (2005); and Member of the Society for Community Research and Action (SCRA).

Her intellectual production has been extensive. She has presented about 200 papers in scientific events, has organized 25 scientific events, and has given about 120 seminars and workshops by invitation in more than 70 academic centers and institutions in almost 20 countries. She has published a total of 156 publications up to October 2004, with 81 articles in journals and 46 chapters in books, and has coordinated 11 books, and another 6 of her authorship. She has tutored at least 56 theses at the Bachelor's, Master's, and Doctoral levels, 15 of which have received honorable mention.

For her outstanding career, she has obtained numerous recognitions and awards, among which the following stand out: Scientific Research Award (1985), Humanities Area-APUCV; "Francisco De Venanzi" Award (1993), Humanities Area- APIU; Interamerican Psychology Award (1995) by the Interamerican Society of Psychology; National

Award for Research in Psychology of the Federación de Psicólogos de Venezuela (FPV) (Federation of Psychologists of Venezuela) (1997); National Science Award (2000), Mention in Social Sciences, Consejo Nacional de Investigaciones Científicas y Tecnológicas (CONICIT) (Council of Scientific and Technological Research); Academic Distinction in merit for his intellectual trajectory and contribution to Latin American Psychology (2003), Universidad Nacional Mayor de San Marcos (San Marcos National University), Lima, Peru; Recognition for scientific work and contribution to Community Social Psychology and Health Psychology in Latin America (2003), Peruvian Forum of Social Psychology; and Researcher Promotion System (2002): Level 4 (PPI-4).

Professor Montero is considered one of the pioneers of Latin American Social Psychology for her contributions to community social psychology, political and critical psychology, and liberation psychology. In addition to being one of the most important researchers in the area, we are undoubtedly talking about a professional committed to the transformation and liberation of Latin American societies, for whom psychology is her passion.

El Salvador · Psychopedagogy · Education · Intelligence

Carlos Filiberto Monterrosa Coto was the precursor of scientific and applied psychology in El Salvador in the decades of 1930 and 1940 (for an expanded review, see Portillo, 2006, 2008). His greatest achievements were founding and directing the Psychopedagogic Laboratory and the Department of Psychopedagogy of El Salvador, which performed rigorous psychological, pedagogical, physiological, anthropometric, and forensic assessments. In addition, the Department

of Psychopedagogy offered psychological training through an academic extension known as the Institute for Professional Advancement. He also authored the first comprehensive works on psychology in the country and performed the earliest documented adaptation of a psychological test for Salvadoran children.

Son of Valentín Monterrosa and Teresa Coto, Monterrosa was born in a rural town and was of modest origin. He completed his elementary education in El Salvador and both his secondary studies and teacher training in Coahuila, Mexico, thanks to the generous support of American and Mexican Baptist missionaries. While in Mexico, he held administrative and teaching positions in noncollegiate teacher training institutions in the cities of Tamaulipas and Durango. Based on the signature that appeared in Monterrosa's last book, published in 1965, he obtained both a Bachelor of Science (BS) and a Master of Arts (MA) degrees. According to one of his students (Alfredo Martínez, personal communication, September 23, 2019), Monterrosa studied in universities in the United States, Spain, and Mexico. However, facts about where, when, and what he studied have not been corroborated yet.

There is evidence that Monterrosa returned to El Salvador from Mexico in 1928 with his wife Mercedes Estrada de Monterrosa, who was Mexican, and established their residence in the town of Chalchuapa (González, 2002), in Santa Ana, near his native town. That same year, Monterrosa accepted the appointment of principal of the Official School of Boys, and the following year, he started training teachers from all public schools in Santa Ana. With his wife, Monterrosa founded "The Latin American School," a place that served children of primarily protestant families from the burgeoning Baptist Church. It was during this time that the Monterrosas lost their only daughter, Thelma Altair, and soon after this tragic event, they left Chalchuapa. The Monterrosas eventually would adopt at least five children later in life (A. Martínez, personal communication, September 23, 2019). In 1931, they moved to the north of Santa Ana, to the city of Metapán, where Monterrosa had accepted a new appointment as the principal of the Official School of Boys. They lived in Ahuchapán as well, but

eventually, the Monterrosas made their way to the capital, San Salvador, in the mid-1930s.

In the early years of the 1930s, Monterrosa began writing and publishing works related to philosophy, history, literature, and psychology. In 1932, he published the very first psychology book in El Salvador, *Psychology Applied to Education*. In 1937, he established his first psychology lab at a school in the city of Santa Tecla in La Libertad. This modest beginning was welcomed by the press and intellectuals of the time, including Jorge Luis Arriola Ligorria, an influential Guatemalan scholar with psychopedagogic training in La Sorbonne. For his own laboratory, Monterrosa used rudimentary material and equipment that he himself had crafted. This initial laboratory was followed by the creation of the Psychopedagogic Laboratory of El Salvador (*Gabinete Psicopedagógico de El Salvador*), a state-of-the-art experimental laboratory funded by the Ministry of Public Instruction. Monterrosa's wife was the chief of methodological applications during its early stage.

The Psychopedagogic Laboratory officially opened its doors on September 15, 1938, in the heart of the city of San Salvador. It employed medical doctors, psychiatrists, teachers, pedagogues, writers, and other intellectuals who were distributed in four main groups: pedagogy, methodology, psychology, and administration. The Psychopedagogic Laboratory started offering psychopedagogic training, introduced the first forensic evaluations of minors charged in the legal system, provided psychological services to children, exhibited short films of psychological experiments conducted in the United States, and conducted and filmed its own psychological experiments on site as well. The Psychopedagogic Laboratory organized conferences by influential scholars such as Carlos Federico Mora Portillo, a Guatemalan medical doctor who, during the 1920s, had studied psychology with John B. Watson in the United States and Freud, Jung, and Adler while living in Vienna.

The Psychopedagogic Laboratory of El Salvador was reorganized and its name changed to the Department of Psychopedagogy of El Salvador in October of 1939. An academic extension of the Department of Psychopedagogy known as the

Institute for Professional Advancement started forming teachers and the general public in several areas of psychology, almost 20 years before the first psychological program was established in the country in 1956. The academic program was designed for 4 years and was divided into two main areas: psychology and pedagogy. Among the courses offered were psychoanalysis, psychology of the masses, experimental psychology, psychophysiology, biology, psychotechnics, pedagogy, and philosophy. After completing 4 year of studies, students would receive a certificate on specialized teaching in pedagogy and philosophy.

Perhaps the most important function of the Department of Psychopedagogy was the systematic application of psychological, physiological, and anthropometric measures among public school students between the ages of 6 and 9 years old. In addition, Monterrosa studied the moral development of children, the influence of the family, the well-being of homeless children, intelligence, the adaptability of urban and rural children to their environment, personality and temperament typologies of children, academic achievement, psychological abnormalities, and the social organization of schools. The national press even made public that Monterrosa had found new typology of Salvadoran children as part of his studies.

Salvadoran president General Maximiliano Hernández Martínez (1882–1966) recruited Monterrosa and three members of the “Generation of the 28” to design the first school reform produced in El Salvador. The recruited members of the “Generation of the 28” had studied under German scholars at the normal school for men in San Salvador and had received college degrees from the University of Chile. Monterrosa was not part of the “Generation of the 28” as inaccurately reported earlier by Portillo (2006, 2008). The full commission was formed by Manuel Luis Escamilla, Celestino Castro, Luis Samuel Cáceres, and Carlos Monterrosa. They worked for the whole year of 1939 under the direct supervision of the president, and the final content of the reform appeared in the *Official Gazette* in December of 1939. With Monterrosa at its helm, the work of the Department of Psychopedagogy

provided the scientific basis of the reform based on the psychological and intellectual profiles of the Salvadoran children that had been systematically tested in schools for several years (Escamilla, 1981).

Monterrosa published the first compendium of scientific studies performed by the Department of Psychopedagogy in 1939. In this document, he detailed the array of measures administered to students and included a copy of the “Mental Scale Adapted for Salvadoran Schools,” a Spanish version of the Stanford-Binet Scale of Intelligence (Form M) (Terman & Merrill, 1937), adapted for Salvadoran children. Previously, Emilio Herodier Bossard and Adolfo Herrera Vega had administered the Binet-Simon Scale among Salvadoran students, probably as early as 1916; however, Monterrosa’s use of the Stanford-Binet Scale of Intelligence is the first documented adaptation of a psychological test done specifically for the Salvadoran population.

During the 1930s, Monterrosa became a celebrity in the news and in intellectual circles. In 1935, he was inducted into the Atheneum, the most prestigious group of intellectuals in the country. He published in its magazine the *Atheneum*, while other works appeared in the *Journal of the Ministry of Public Instruction* and local periodicals. In 1940, responding to an alarming Op-Ed published in the *Central America Newspaper* that claimed that a large percentage of Salvadoran children were psychologically abnormal, Monterrosa clarified that such percentage was slightly less than 5% based on the 25,000 subjects that had been assessed throughout the country, on par with figures found in South America.

Carlos Monterrosa had achieved a respectable scientific status by the late 1930s, and thanks to that, he presented his work at the Eighth American Scientific Congress held in Washington, DC, in May of 1940. According to the Congress proceedings (Oehser, 1941), Monterrosa presented two empirical studies based on the work that he had conducted among Salvadoran children. Renowned psychologists such as Arnold Gesell (1880–1961), Alfredo D. Calcagno (1891–1962), and Emilio

Mira y López (1896–1964) were among some of its distinguished attendees as well.

The vast success of Monterrosa’s project was greatly indebted to General Maximiliano Hernández Martínez who was fond of theosophy, the occult, and psychology. Nevertheless, Monterrosa’s vision, leadership, and endeavors were frequently challenged during his time. Based on several decrees and laws compiled in the *Official Gazette*, published between 1938 and 1944, it is known that the Department of Psychopedagogy operated only from 1939 to 1941. The Institute for Professional Advancement, which served as its academic extension, was formally ended in May of 1941 because it had failed to produce a single student who completed the full program of studies. That same month, Monterrosa was substituted by Rafael Ramírez Chulo as director of the Department of Psychopedagogy. Despite these setbacks, Monterrosa continued occupying a number of important posts at the Secretary of Public Instruction, officially until January of 1944.

Monterrosa, however, did not complete his last appointment and presented his formal resignation as a top official in 1943 and decided to leave El Salvador for San Francisco, California, in August of that same year. Based on documental evidence provided in 2009 by Monterrosa’s grandnephew Dagoberto Coto, it is now known that he managed to escape the fall of Hernández Martínez’s regime and did not return to El Salvador until December of 1945 for a three-month visit. During World War II, he was drafted into the US military service, and between 1943 and 1945, he worked as a ship scaler in the city of San Francisco (Ancestry.com, 2011). Ship scalers were the maintenance crews of the docks, doing the lowest-paying and dirtiest work available.

After staying in the United States for a few years, Monterrosa came back to El Salvador at the end of the 1940s, worked as a teacher, and became active once again in the field of research. However, his greatest achievements were behind him. In 1953, he presented his work at the 2nd National Child Congress and coincided with Albert W. Stahel (?–?) and Salvadora Tijerino Rizo (1912–1991), two of the driving forces

behind the establishment of the career of psychology in the country. Interestingly, Monterrosa did not play a role in it, notwithstanding all the work that he had previously done.

According to Gilberto Aguilar Avilés (Personal communication, May 17, 2005), Monterrosa lived in San Marcos, a town south of the capital. There, he established a private normal school named “Democracy Institute” that trained students to become teachers. Monterrosa was known for his generosity and often offered scholarships and shelter to students from low socioeconomic status. All his adopted children studied there and some taught there too. He died of natural causes in San Salvador.

Guatemala · Psychiatry · Forensic psychology · Forensic medicine

Carlos Federico Mora Portillo is regarded as Guatemala’s first psychiatrist. His profound intellect and vast preparation in the fields of medicine, psychiatry, neurology, and psychology led him to study with renowned scholars such as John B. Watson, Sigmund Freud, Otto Marburg,

Gustav Jung, Alfred Adler, and Julius Wagner von Jauregg. His major contributions to psychiatry and psychology focused particularly on their forensic applications. His professional, academic, political, and diplomatic career places him as one of the most important pioneers of psychology, psychiatry, and public policy in the Central American region.

Son of Dr. Enecón Mora Aguilar (1861–1909) and Mrs. Ángela Portillo de Mora, he was born into a prominent family in the city of Quetzaltenango, which lies within Guatemala's Western Highlands. In addition to having been mayor of his hometown, his father was a physician and served as dean of the School of Medicine of Quetzaltenango's Universidad de Occidente (University of the West), which closed in 1902. He also directed the School of Medicine's periodical, *Gaceta Médica de Occidente* (Western Medical Gazette) and Quetzaltenango's Asilo de Ancianos y Hospicio de Occidente (Nursing Home and Hospice). Carlos Federico attended primary school in his natal Quetzaltenango, but was forced to continue his secondary studies in Guatemala City due to the damages caused by the eruption of the Santa María Volcano in 1902. In Guatemala City, he continued his education at the Polytechnic School and obtained his high school degree in sciences and letters at the Central National Institute for Boys in 1909. Following in his father's footsteps, he entered Universidad de San Carlos (San Carlos University) to study medicine (von Ahn, 1996).

He obtained his medical degree on April 24, 1916, and his degree paper won second place in the José Felipe Flores Award of the School of Medicine. Subsequently, Mora received a scholarship to study in Mexico, where he conducted research on rabies. He completed his military service as a surgeon in Puerto Barrios and Puerto San José, Guatemala. He then moved to the USA, to John Hopkins University in Baltimore, Maryland, to pursue graduate studies in psychology and psychiatry. While there, he worked as an assistant to behaviorist John B. Watson (von Ahn, 1996). He also worked at the Henry Phipps Psychiatric Clinic, the first school of psychiatry in the USA, which was affiliated with John Hopkins

University. In order to cover his living expenses, he worked as a translator and Spanish instructor (Villalobos, 2015).

He continued his studies in forensic medicine and psychiatry at the University of Paris in 1921 and then moved to Rome to study psychology of criminals. Upon his return to Guatemala, he was appointed director of the Asilo de Alienados (Asylum for the Alienated) (1923–1927). During this period, he initiated psychiatric therapeutics in the country, employing methods such as abscess fixation, hydrotherapy, hypnosis, malariotherapy, Sakel's cure (insulin shock), von Meduna's cure (cardiazole shock), and Cerletti and Bini's technique (electroshock). He also introduced the use of straitjackets and was a lobotomy pioneer in Guatemala (von Ahn, 1996; Hernández-Gálvez, n.d.).

Toward the end of the 1920s, he returned to Europe as a diplomat, but he pursued further specialization studies as well. He took courses in psychoanalysis with Sigmund Freud (1856–1939) and neurology with Professor Otto Marburg (1874–1948) at the University of Vienna. He also did an internship at the Neurological Institute at the Wagner Clinic of the University and at the Steinhof Asylum (Universidad Francisco Marroquín, n.d.). Carl G. Jung (1875–1961), Alfred Adler (1870–1937), and Julius Wagner von Jauregg (1857–1940), the winner of the Nobel Prize in Medicine 1927, were some of his mentors while living in Vienna. He also studied neurology, psychiatry, and forensic medicine at the Universities of Berlin and Hamburg. As a diplomat in Germany, he was the consul general of Guatemala in Hamburg (1927–1928) and minister plenipotentiary (1928–1930) (Martin, 1940; von Ahn, 1996).

Once back in Guatemala, he served as director of the Hospital Psiquiátrico Nacional (National Psychiatric Hospital) (1930–1944). In 1932, he founded the chairs of psychiatry and forensic medicine in the Faculty of Medicine and the chair of legal medicine in the Faculty of Juridical and Social Sciences of the National University of Guatemala as San Carlos University was named then (Martin, 1940; von Ahn, 1996). In the 1930s, Mora maintained contact with other pioneers of

psychology in Central America, such as Carlos Monterrosa (1902–1977) from El Salvador. He visited Monterrosa's experimental psychology laboratory in San Salvador and gave talks on psychology and psychoanalysis at the University of El Salvador. In Guatemala, Mora had been the director of the Ministry of Education's psychology laboratory until 1933 when he was replaced by Jorge Luis Arriola Ligorria (1906–1995).

Federico Mora married Rosa Castañeda in 1925, who, supported by her husband, had a very uncommon professional development for women of the time. Rosa distinguished herself as a social activist and became the first woman deputy to the Congress of the Republic. She founded la Casa del Niño (the Child's Home) and the Liga Nacional contra la Tuberculosis (National League Against Tuberculosis). She also stood out as president of the board of directors of the Child Welfare Society and published *The Care of Children* (de Mora, 1938), a best seller used by different generations of mothers that addressed issues related to pregnancy, health, hygiene, early development, and child care. In 1955 she was selected as the first woman of the year by the newspaper *Prensa Libre* (Prensa Libre, 2016). The couple had three children: Federico, Ángela, and Cordelia Rosa (Martin, 1940; von Ahn, 1996).

Mora's political activism took center stage as he was one of the 311 citizens who signed a letter demanding the departure of the president of the republic Jorge Ubico (1931–1944) and the prompt restoration of constitutional rights. When Ubico stepped down and left office in July 1944, Mora was immediately proposed as interim president in the Guatemalan congress, but Federico Ponce Vaides, one of the three military officers delegated by Ubico to succeed him, demanded to be appointed as interim president himself at gunpoint (Sabino, 2007). His presidency, nevertheless, lasted barely over 3 months (July 4–October 20, 1944).

In a twist of fate, Federico Ponce Vaides was forced by the San Carlos University student congress to appoint Mora as rector for the 1944–1945 period as they rejected the one left in place by Jorge Ubico (Vrana, 2017). In October of 1944, Ponce Vaides was deposed by a growing

opposition and was succeeded by a three-person civilian transitional junta. In 1945, Juan José Arévalo (1904–1990), a philosophy professor who held a doctorate in education, became the country's first democratically elected president. Arévalo enlisted Mora as his Minister of Public Health and Social Welfare. During his tenure as Arévalo's minister, Mora founded the Mental Health Center for Children and Adolescents. Previously, during the administration of President General Lázaro Chacón (1873–1931), Mora had served in 1926 as Minister of Public Education.

Mora had a very active professional participation as well. He was a member of the Society of Legal Medicine of Paris, Wiener Psychiatrische Verein, the Guatemalan Red Cross – where he was vice president, the Society of Medicine and Surgery of Guatemala, the Society for the Protection of Children, Guatemala's Mental Hygiene League, the Patronato Anti-Alcohólico (Alcohol Rehabilitation Agency), Club Guatemala, the Spanish Academy of Language, and the Deutsch-Ibero-Amerikanische Aertze Akademie of Berlin. Together with a group of professionals, he founded the Psychiatric Society of Guatemala in 1971. Mora was also a cofounder of the Universidad Popular de Guatemala (Popular University of Guatemala), promoting the training of artists and the dissemination of art in the country, especially drama (von Ahn, 1996). He also received an honorary doctorate from the University of El Salvador (Martin, 1940; von Ahn, 1996).

Mora had a long academic life as a university professor and was a very prolific author. His teaching career lasted until 1970, training generations of physicians and lawyers. In addition to his medical degree paper, he published a number of seminal books, some of which were used to train medical and law students. In 1926, the journal *La Escuela Salvadoreña* published an excerpt from one of his books under the title "Psico-Pathología Infantil: Concepto Psico-Biológico de la Personalidad" (Child Psycho-Pathology: Psychobiological Concept of Personality). In this work, Mora incorporates many of the teachings of professor John B. Watson applied to pedagogy while seeking to explain the biological basis of

personality, without falling into a purely behaviorist perspective. It is worth mentioning that he was also director of the Guatemalan magazine *Vida*, of avant-garde style publication during the 1920s.

Federico Mora died on September 9, 1972, at the age of 83, as a result of a cerebrovascular accident. His Alma Mater, San Carlos University, decreed 3 days of mourning and the flag flew at half-mast. The Mental Health Hospital, Guatemala's main psychiatric public hospital, was inaugurated and named after him in 1975 (Gutiérrez-Martínez, 2020).

Morales studied at the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM); she studied her master's degree in General History in the Facultad

Lucina Isabel Reyes Lagunes: deceased.

de Filosofía y Letras (Faculty of Philosophy and Letters) (FFyL), a bachelor's degree in Psychology in the Colegio de Psicología (College of Psychology) (at that time, part of FFyL), and a master's degree in Social Psychology in the Facultad de Psicología (Faculty of Psychology) (FP) (UNAM, 1981).

In 1962 she began his professional career at the UNAM as an Assistant Professor at the then College of Psychology. She participated in the reformulation of the psychology study program in 1966, 1971, and 1973. Also, she held academic-administrative positions, such as the General Secretary of the Colegio de Psicología (College of Psychology) in 1966 (Cueli, 1993); and the Secretary of the Teaching Staff in 1973, likewise served as coordinator of two programs: (1) Psychometric and Experimental Psychology Practice and (2) Psychological Measurement.

At the Instituto Nacional de Ciencias del Comportamiento y de Actitud Pública (National Institute of Behavioral Sciences and Public Attitude) (INCCAPAC), she was Secretary General in 1965 and Director of the Department of Social Psychology in 1973. At the Consejo Nacional para la Enseñanza e Investigación en Psicología (National Council for Teaching and Research in Psychology) (CNEIP), she served as Executive Secretary from 1980 to 1985.

She was a professor at the FP of the UNAM from 1973 to 1985, where she taught courses in culture, psychological methods and techniques, measurement, test, personality, intelligence, traits, human development, language, social groups, and evaluation.

In addition, she collaborated with other institutes and universities outside the UNAM. At the Universidad Autónoma del Estado de México (Autonomous University of the State of México) (UAEMex), she was a member of thesis committees of the Facultad de Ciencias del Comportamiento (Faculty of Behavioral Sciences) and a consultant to the Rectoría (1975) (Díaz y Serna, 2002). She also acted as advisor and collaborator in projects for the Hospital Psiquiátrico Infantil (Children's Psychiatric Hospital) and for the Instituto Mexicano del Seguro Social

(Mexican Institute of Social Security) (IMSS) in 1976.

Morales was the co-founder of the Centro de Investigaciones en Ciencias del Comportamiento (Center for Research in Behavioral Sciences) (CICC) in 1964, (later called INCCAPAC, in 1973), of CNEIP in 1971, and the *Revista de Enseñanza e Investigación en Psicología* (Journal of Teaching and Research in Psychology) of CNEIP in 1974.

At INCCAPAC, in collaboration with his mentors, Dr. Rogelio Díaz-Guerrero and Dr. Luis Lara Tapia, she formed psychological research groups on topics relevant to Mexican society at the individual, social, and institutional levels (Almeida & Díaz Guerrero, 1980). These research groups established collaborations with the IMSS in 1976 and the Secretaría de Educación Pública (Ministry of Public Education) (SEP). These research projects were financed by the Rockefeller and Ford Mexico foundations (Millan, 1982).

His work at INCCAPAC was developed in lines of research such as (1) differences in personality development between the United States and Mexico; (2) coping styles and school performance; (3) sociocultural factors that influence overpopulation, fertility, and family planning; (4) perceptions and attitudes toward menstruation; (5) translation, adaptation, and standardization of North American psychometric tests for use with Mexican samples; and (6) associations between psychometric tests and personality traits among individuals of different socioeconomic backgrounds.

With the research projects at INCCAPAC, undergraduate and master's theses and doctoral dissertations were prepared. Morales participated as a member in 73 undergraduate thesis committees and two master's thesis committees (Menéndez Menéndez, 1996). She also authored and co-authored research articles and made presentations at national and international conferences on the research results of these projects. She is the author of the book on *Applied Psychometry* (1975), which is still in use among students.

She was a member of the Sociedad Mexicana de Psicología (Mexican Society of Psychology), the Sociedad Interamericana de Psicología

(Interamerican Society of Psychology) (SIP), the Asociación Mexicana de Población, A.C. (Mexican Association of Population, A.C.), the CNEIP, and the INCCAPAC.

María Luisa Morales was a key psychologist in the formation of scientific psychology, psychometric methodology, and the identity of the psychologist in Mexico.

She was part of the first generation of undergraduate psychologists in San Luis. Later on, she became a professor at both undergraduate and graduate levels. In Argentina, she was a pioneer in psychological research in psychoacoustics and personality assessment, becoming a national and international reference and a successful trainer of researchers in this field.

She began her academic career at the Universidad Nacional de Cuyo (National University of Cuyo), San Luis, where she graduated in 1958 as Profesora de Enseñanza Secundaria, Normal y Especial (Professor of Elementary, High School, and Special Education) in Philosophy and Pedagogy. In 1966, she obtained a degree in psychology. For the next 2 years, she studied in London where she specialized in Individual Loudness Functions under the direction of William Tempest and the collaboration of Michael E. Bryan (1932–2011) of the Department of Engineering, Audiology Unit, University of Salford.

There she obtained her Master of Science degree. Back in San Luis, she continued this line of research in her doctoral dissertation which she defended in 1969 under the direction of Plácido Horas (1916–1990).

In this work, Barbenza studied the perceived intensity of the sound, a subject that had great popularity in American and European centers of experimental psychology because of the many promising applications. She differed from an atomistic approach to sensation and studied it within the evaluation of individual differences in personality framework. She valued the unity, totality, and significance of the perceptual experience in processing external and proprioceptive stimuli as a result of an integration of mnemonic images, affects, and motivations of the perceiving person. She incorporated the British tradition from Francis Galton (1822–1911) to Hans Eysenck (1916–1997) in the study of individual differences. The latter author had been early known in San Luis thanks to Eva Borkowska de Mikusinski (1921–2020). Barbenza critically pointed out that, in general, experimental studies on perception had tended to ignore individual differences because of the methodological difficulty involved in such variables and that, rather, studies had focused on obtaining parametric values in the search for technical achievements (e.g., loudness scales for telecommunications). Barbenza, however, took up contributions (Witkin & Gardner, 1954; Krech & Crutchfield, 1948) that considered the total experience of perception including structural factors derived from the physical nature of the stimuli and their cerebral functional effects, such as the perceptual organization derived from the individual's needs, moods, past experience, and memory of perception. It was also supported by works on visual masking and personality traits (Bruner & Goodman, 1947; McLaughlin & Eysenck, 1966), recognizing backgrounds in Henri Piéron (1881–1964). Among the French-speaking contributions, she also highlighted the motivational studies of Paul Fraisse (1911–1996) and the contributions to the cognitive field of Jean Piaget (1896–1980). She was familiar with the work of S. D. G. Stephens (1942–2012), from the

University of Cambridge, and the work of the American S. S. Stevens (1906–1973), who also had an influence on the training of the Argentine researcher Miguelina Guirao (1925–) (Piñeda & Scherman, 2016). From S. S. Stevens, Barbenza valued his contributions on the measurement of psychological attributes of physical stimuli with comparative range scales, since he overcame the Fechnerian methods (scales of minimum perceptible differences), with their scales based on proportions. In this context, Barbenza introduced the studies of his English professors (McRobert et al., 1965) who, in controversy with Stevens, pointed out that the loudness submitted to the judgment of observers was not absolute, but relative to personality variables. In this direction, Barbenza noted the contributions of her colleague Guirao (Stevens & Guirao, 1964), who suggested the incidence of personality variables in recording the stable response of subjects in various sessions. Using experimental sessions and information on subjects' personality variables provided by the Minnesota Multiphasic Personality Inventory (MMPI), Barbenza demonstrated that inter-individual differences in loudness magnitude seemed to be related to differences in the basic personality structure of individuals. Thus, those persons who show high arousability seemed to be more sensitive to loudness and vice versa.

While analyzing Barbenza's production in the field of perception, it is possible to observe that she conducted research on this topic from the beginning of her doctoral studies until 1985. Her most relevant publications appeared in top international journals, some of them on an interdisciplinary scope (Barbenza et al., 1970; Barbenza, 1976; Barbenza and Uhrlandt, 1983). However, after that period, Barbenza continued her research, in the area of basic psychic processes and personality assessment, and gradually left psychoacoustics behind, perhaps because of the budgetary and structural difficulties of the Argentine Psychology Programs to support experimental psychology laboratories. As a matter of fact, in 1980, Barbenza organized the Experimental Psychology Laboratory of her university, which since 1973 became the Universidad Nacional de San Luis (National University of San Luis) (UNSL). The

laboratory was only kept for 3 years in operation. Nevertheless, she had the merit of bringing together a community of psychologists identified with the behavioral sciences, something unusual in local psychology programs. Those conditions led Claribel Barbenza to be elected in 1987 as the first President of the Asociación Argentina de Ciencias del Comportamiento (Argentine Association of Behavioral Sciences) (AACC), an institution that currently represents Argentina at the International Union of Psychological Science (IUPsyS).

In 1990, at UNSL, she created the Laboratorio de Investigaciones en Ciencias del Comportamiento (Behavioral Sciences Research Laboratory) and organized the Maestría en Psicología Clínica Cognitivo-Integrativa (Master's Program in Cognitive-Integrative Clinical Psychology) which she directed. She also headed the PhD Program in psychology at that university. She directed over 10 PhD Dissertations, including Angel Rodriguez Kauth (1941–2020). She was active in university management tasks being in charge of several secretariats and commissions in the academic area, science and technology, and postgraduate, among others.

In 1980, she became the first President of the Colegio de Psicólogos (Psychologists Association) of San Luis. She was also a member of several scientific societies that distinguished her international career, such as the Interamerican Society of Psychology, the Society for the Exploration of Psychotherapy Integration, the Asociación Argentina de Estudio e Investigación en Psicodiagnóstico (Argentine Association of Study and Research in Psychodiagnosis), the American Psychological Association, and the Asociación Iberoamericana de Evaluación y Diagnóstico Psicológico (Iberoamerican Association of Psychological Evaluation and Diagnosis). She was appointed as Professor Emeritus at UNSL in 1997.

Juliano Moreira, an Afro-Brazilian, began his medical training at the *Faculdade de Medicina da Bahia* (Bahia School of Medicine) in 1886. He became a physician at the age of 19, in 1891.

In 1896 he was hired by the same school as a substitute professor of clinical psychiatry and nervous diseases. From 1893 to 1903, Juliano Moreira was an alienist and an adjunct physician at the São João de Deus Asylum linked to the *Santa Casa de Misericórdia da Bahia* Hospital. During this period, he also focused on neuropsychiatry, contributing to the periodicals *Gazeta Médica da Bahia* and *Revista Médico-Legal*, and also helped found the *Sociedade de Medicina e Cirurgia da Bahia* (Bahia Society for Medicine and Surgery), in 1894, and the *Sociedade de Medicina Legal da Bahia* (Bahia Society for Forensic Medicine) (1895).

From 1895 to 1902, Moreira took a series of trips to Europe and came into contact with the ideas of Richard von Krafft-Ebing (1847–1902), Emil Kraepelin (1856–1926), and Sigmund Freud (1856–1939), among others. After returning to Brazil, he visited psychiatric institutions in different Brazilian states and published a panorama of general medicine and Brazilian psychiatry during the years 1901–1902 in the *Gazeta Médica da Bahia* (Moreira, 1902).

In 1905, Juliano Moreira, together with Júlio Afrânio Peixoto (1876–1947), founded the *Sociedade Brasileira de Neurologia, Psiquiatria e Medicina Legal* (SBNPML) (Brazilian Society for Neurology, Psychiatry, and Forensic Medicine), the periodical *Archivos Brasileiros de Psiquiatria, Neurologia e Ciências Affins*, and the *Sociedade Brasileira de Psiquiatria, Neurologia e Medicina Legal* (Brazilian Society of Psychiatry, Neurology, and Forensic Medicine) (in 1907). In 1911 he helped found the periodical *Archivos Brasileiros de Medicina*. He was one of the founding members of the *Sociedade Brasileira de Ciências* (Brazilian Society for the Sciences) in 1916. He was also a member of other Brazilian associations, such as the *Instituto Histórico-Geográfico Brasileiro* (Brazilian Historical-Geographical Institute) and the *Academia Nacional de Medicina* (National Academy of Medicine). He was a member of the executive board and was honorary president of the *Liga Brasileira de Higiene Mental* (Brazilian League for Mental Hygiene) (1923), and also served on

the executive board of the periodical *Archivos Brasileiros de Higiene Mental*.

In 1903, Juliano Moreira was appointed director of the *Hospício Nacional de Alienados* (HNA) (National Hospital for the Mentally Ill), and in the same year he recommended that the institution's facilities be updated, in addition to indicating the importance of enacting legislation to assist the mentally ill in Brazil. As director of the HNA, Moreira followed the guidance of the German-language psychiatrists, whom he had met with Emil Kraepelin and whose thinking differed from that of the French psychiatrists traditionally admired in Brazil (Moreira & Peixoto, 1906). With the support of organicism (through the systemization of mental illnesses as nosological units), psychiatric science under Moreira began to favor and consolidate the interest in causal relationships between somatic disorders and mental consequences, seeking to systematize the psychiatric morbid entities, similar to that done for the organic ones (Moreira, 1910), for the purpose of nosographical classification (Facchinetti & Muñoz, 2013). Subsequently, Juliano Moreira was also appointed general director of *Assistência a Alienados* (the Mental Health Service) (1911–1930).

As part of the facility renovations carried out by Moreira, an Experimental Psychology Laboratory (EPL) was established in 1907. The lab consisted of a room with psychological instruments that Juliano Moreira had imported directly from Europe to update the department's equipment. After its inauguration, Moreira chose Maurício Campos de Medeiros to run the laboratory. With the new experimental technology, psychological exams of the mentally ill began to include objective assessments based on increasingly sophisticated research instruments and technology (Facchinetti & Jacó-Vilela, 2019).

Juliano Moreira was also an important promoter and articulator of psychoanalytic clinical practice in Brazil. He encouraged debate on this topic during meetings of the SBNPML, held at the HNA while he was president of the Society. Moreira stated that the merit in Sigmund Freud's work was that he systematized a set of techniques

and theories from a singular, coherent perspective. However, he also stressed that “one did not need to be an orthodox follower of Freud’s ideas in order to make the most of what was useful” (Moreira apud Austregesilo, 1922, p. 113). Precisely as a tool, using part of its theoretical apparatus, Moreira and other psychiatrists used psychoanalysis in private practice when treating society ladies in Rio de Janeiro. Similarly, psychoanalysis was gradually integrated into the practices of the HNA during that period (Castro & Facchinetti, 2015).

In 1927, the *Sociedade Brasileira de Psicanálise* (Brazilian Psychoanalysis Society), the first in Latin America, was founded in a meeting in the city of Sao Paulo (Castro, 2015). In 1928, the first issue of the *Revista Brasileira de Psicanálise* was produced, the only issue of the periodical published by the Society. The appearance of the periodical was not unnoticed by Freud, who declared: “I was very happy to see the *Revista Brasileira de Psicanálise*” (Freud, [1928]1994, p. 89), and wished the journal and the group great prosperity. In 1928, led by Juliano Moreira, a group of psychoanalysts met at the HNA (renamed the *Hospital Nacional de Psicopatas* in 1927) because they were interested in founding a Rio de Janeiro section of the *Sociedade Brasileira de Psicanálise* in São Paulo. Due also to the importance of Juliano Moreira, the Society’s headquarters moved to Rio de Janeiro, with Sao Paulo becoming a regional section (Castro, 2015).

Juliano Moreira left his positions as director of the *Hospital Nacional de Psicopatas* and general director of the Mental Health Service in 1930, when he was forced to retire during a major reform of the Federal District Mental Health Service (Vanancio, 2005). With the worsening of his chronic tuberculosis, his physician sent him to the Petropolis mountains for treatment. He died in 1933.

Carlos Moreno Benavides was born in Bogotá, but due to his father's health, his family moved to Fusagasugá, in the department of Cundinamarca, 3 h away from the capital of Colombia. He obtained a bachelor's degree there on November 1958 and graduated from the Universidad Nacional de Colombia (National University of Colombia) in Bogotá as medical doctor and surgeon on January 1966. He became a professor in that institution (National University of Colombia) once his rural year was over, in 1968. Years later, he completed postgraduate studies in education focusing on higher education lecturing. He received a master's degree from the Universidad Pedagógica Nacional de Colombia (National Pedagogical University of Colombia) in 1996.

Regarding his professional experience, Carlos worked as a rural doctor at Ecopetrol Hospital in the department of Santander and as a resident doctor in different hospitals in Bogotá. During his work at the Social Security Institute, he was medical advisor of the Evaluation Office, also involved in teaching and management, and he was the head of the Medical Education Section of that institution. He served as coordinating physician at the Neurological Institute Foundation of Colombia, where he worked next to the neuropsychologist Alfredo Ardila (1946–2021). That gave him the possibility of applying treatments and brain research studies with the patients who attended there.

Moreno was a professor in several psychology programs of universities such as National University, Pontificia Universidad Javeriana (Pontifical Javeriana University), Universidad de Los Andes (University of Los Andes), and Fundación Universitaria Konrad Lorenz (Konrad Lorenz University Foundation) (an institution he helped to organize with Juan Alberto Aragón, and he even suggested its name). However, most of his work was dedicated to the faculties of medicine of the National University of Colombia and the Universidad del Rosario (Del Rosario University). He was also a professor of the National Pedagogical University. He is recognized as emeritus professor at the National University of Colombia and Del Rosario University (2006), where he worked for 48 years and received special recognition from the institution and the students. He founded and actively worked in various associations such as the Ethology Association (Carlos Moreno established this area for the first time in a number of faculties of psychology, in Latin America), the Society of Biological Psychiatry, and the Society of Obesity and Metabolism. Moreno was also instrumental in the study of pain which he began to study in the 1970s and was a pioneer in the foundation of pain groups in Colombia.

The last research group, which belonged to Colciencias, was the interdisciplinary group Neuros, which he founded and worked with enthusiasm next to other colleagues from the

Faculty of Medicine of Del Rosario University. This group played a central role for medical doctors from various specialties, psychologists, and students from different areas. The group has stood out for having an active academic life and has been the source of valuable publications.

Moreno's interest in research led him to topics such as pain and perception. He was known as one of the precursors of ethology studies in psychology; he directed the first thesis of ethology of psychology students in Colombia, published articles in specialized journals in Colombia and other countries, and taught ethology at the aforementioned universities. In collaboration with Alfredo Ardila, he produced the book *Biological Aspects of Learning and Memory*, together with Mexican researchers in neurosciences and as a result of academic activities carried out in both Mexico and Colombia. He also coauthored two other books, one on aggression and violence and one on the evolution of the human mind.

Throughout his life, he has been awarded with various distinctions, such as the National Prize of Psychology for teaching merits in 1978, granted by the Colombian Federation of Psychology. He obtained the Monsignor Castro Silva Medal twice as an illustrious person by Del Rosario University. He was representative of the Higher University Council in the Faculty of Medicine of the National University of Colombia. As previously mentioned, Carlos Moreno was a founding member of the Colombian Association for the Study of Pain and the Colombian Association of Biological Psychiatry. He was honored with the membership of the International Society for Human Ethology, the International Association for the Study of Pain, and the International Society for the History, Philosophy, and Social Studies of Biology. He was also a founding member and first vice president of the Colombian Society of Neuropsychology.

Elsa Amanda Rodríguez Acosta was an undergraduate student at the National Pedagogical University, the same one where Carlos taught postgraduate classes. From the love that arose between them, three children were born, two

boys and a girl. It also put down roots in academic fields, because, at the beginning of the relationship, Carlos had the task of forming a group with other professors to carry out academic activities. Elsa Amanda recommended him to contact José Antonio Sánchez, a prominent figure in psychology in Colombia, who was dean of the Faculty of Psychology at the Pontifical Javeriana University. He appointed Carlos Moreno professor of neurophysiology. Later, Sánchez added Alfredo Ardila to his professors' team, who was working in Tunja, capital of the Department of Boyacá, in Colombia. This is how Carlos Moreno and Alfredo Ardila taught for the first time in the country the subject of psychophysiology, which would later become ethology, and they were one of the pioneers in Latin America with an evolutionary vision teaching in a Faculty of Psychology. From there, Carlos and Alfredo became close friends and, besides having fun, together had done a great job in Colombian psychology. It is worth remembering that Carlos was one of the persons who influenced Alfredo to study in Russia with Alexander Luria in neuropsychology.

In the words of Alfredo Ardila, "Carlos participated in the formation of many generations of psychologists, as a professor at the National and Javeriana universities. He took an active part and was on the board of directors of the First International Congress of Neuropsychology (Bogotá, 1981). He wrote several chapters and scientific articles on the biological bases of behavior. His evolutionary approach has had a great impact on the development of Colombian psychology."

Alejandro Moreno Olmedo studied philosophy at the Seminario Salesiano (Salesian Seminary) of Caracas, Venezuela, between 1950 and 1953. From 1956 to 1960, he studied theology at the Seminario Salesiano Internacional (International Salesian Seminary) of Ivrea, Italy. He returned to Venezuela and began studying psychology at the Universidad Católica Andrés Bello (UCAB) (Andres Bello Catholic University), where he obtained a degree in psychology, Summa Cum Laude in 1967.

In 1975, he completed a Specialization in Educational Psychology at the Universidad Complutense (Complutense University), Madrid, Spain. He returned to Venezuela in 1979 to study at the Universidad Simón Bolívar (USB) (Simon Bolivar University) in Caracas, where he obtained a degree as Magister Scientiarum in psychology. He began his doctoral studies at the Universidad Central de Venezuela (UCV) (Central University of Venezuela) in Caracas, where he obtained the degree of Doctor of Social Sciences in 1993.

In 1967, he founded the Centro Salesiano de Psicología (Salesian Center of Psychology), where he was director from 1967 to 1973 and 1979 to 1982. In 1990, he founded the Centro de Investigaciones Populares (CIP) (Popular Research Center); in this center, several types of

research have been developed oriented to the search for knowledge and understanding of the Venezuelan popular world of life; the researches are inscribed within the qualitative paradigm in social research, using the biographical approach or life stories. Moreno served as director of the CIP from its foundation until the day of his death. He developed activities in the field of teaching at the Universidad de Carabobo (Carabobo University), at Valencia, Venezuela, where he retired as a full professor. He also worked as a professor at UCAB (1986) and was a guest professor at the Universidad Nacional del Sur (National University of the South) at Bahía Blanca, Argentina, in 1990. He held management positions in higher education and from 1984 to 1987 was director of graduate studies at the Facultad de Educación (Faculty of Education) of the Universidad Central de Venezuela (Central University of Venezuela).

Alejandro Moreno, a Salesian by formation, dedicated himself to work for the neediest; he lived for more than 30 years in the San Isidro neighborhood in Petare, one of the most populated neighborhoods in the metropolitan area of Caracas, Venezuela; this scenario was his experiential laboratory, a context that inspired him to research and write. He wrote numerous reports documenting the criminal violence in Venezuela. He conducted several qualitative types of research; through life stories, he managed to understand the violence in Venezuelan neighborhoods and wrote journal articles and books, among which stand out the following: *Historia de vida de Felicia Valera* (Life story of Felicia Valera) (Moreno, 1998), *La Familia Popular Venezolana* (The Venezuelan popular family) (Moreno, 1995), *El Aro y la Trama* (The Ring and the Weft) (Moreno, 1993), *Buscando Padre. Historia de Vida de Pedro Luis Luna* (Searching for Father. Life story of Pedro Luna) (Moreno, 2002), and *Y salimos a matar gente* (And We went out to Kill People) (Moreno, 2007). This last book is considered one of the most complete investigations on Venezuelan delinquency and its popular origins. Moreno has published also approximately 90 articles.

His outstanding contributions were recognized; he obtained the distinction of University

Researcher of the Central University of Venezuela and received in 2018 the Honor Award for Merit, category “Academic-Research,” from the Federación de Psicólogos de Venezuela (Federation of Psychologists of Venezuela). He also received in 2021 the Premio *Valores Democráticos* (Democratic Values Award), category “Democratic Integrity,” from the Centro de Estudios Políticos y de Gobierno (Center for Political and Government Studies) of the Andrés Bello Catholic University.

Being of Spanish origin, Father Alejandro Moreno, was passionate about Venezuela due to which he became a Venezuelan national. He was an inhabitant of the neighborhood, a great reader, and a scholar, but above all a priest/psychologist with a great capacity to understand others. For that reason, when studying and addressing the issue of violence in Venezuela, the works of Father Moreno are referential documents. He is considered one of the researchers who could better understand through his research the essence of the social life of the neighborhoods and the importance of the maternal figure in the Venezuelan popular family (Prieto, 2019). The master, as he was called by his disciples of the CIP, left indelible traces impregnated with responsibility, work, discipline, study, and respect for the realities of people and social groups (Pérez, 2020).

Argentina · Psychology · Pioneers · Teaching · Psychology program

He was one of the pioneering promoters of the psychology program at Universidad Nacional de Tucumán (National University of Tucumán, UNT) in San Miguel de Tucumán (Ventura, 2009).

He promoted the clinical orientation in the psychology program in Tucumán and he was a fervent defender of psychoanalysis, considering it fundamental in the psychologist’s training.

He graduated in 1938 from the Universidad de Buenos Aires (Buenos Aires University) where he obtained the degree of National Normal Professor in Letters, and since then he devoted himself to studying psychology as an autodidact, because there was not yet a university psychology program in the country. His “self-taught” training was done at Hospicio de las Mercedes (Mercedes’ Hospice) (Buenos Aires) with the Argentine psychiatrist Gonzalo Bosch (1885–1967) in pathological psychology, and with the Spanish Emilio Mira y López (1896–1964) in general psychology (Ventura, 2009). He also attended lessons related to psychology in the Facultad de Medicina (Faculty of Medicine) and in the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) both at Universidad de Buenos Aires (University of Buenos Aires) (Ventura, 2009).

In 1946, he was appointed as technical psychology advisor by the Consejo Nacional de Educación (National Council of Education), and from 1948 to 1952, as director of the Instituto de Psicología Educacional y Orientación Profesional (Educational Psychology Institute and Professional Guidance) in the city of La Plata, capital of the Province of Buenos Aires, one hour away from the city of Buenos Aires. He worked in such institution with Jaime Bernstein (1917–1988) and Bernardo Serebrinsky (1908–1956), among others collaborators. He joined the Universidad Nacional de Tucumán (National University of Tucumán) on December 17 (1952) as an associate professor in two courses: Pedagogical Psychology at the Education Science Program and Introduction to Psychology at the Philosophy Program, both from the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities). At the end of 1953, he also taught the course of Contemporary Psychology since the professor Oscar Oñativia (1919–1995) moved to Salta; for that reason, in early 1954, he was teaching three courses (Ventura, 2009).

The syllabus of the course Introduction to Psychology consisted in three different parts: the first was an organic perspective of psychology, the second was related to a general psychology, and the third one was an introduction to contemporary

psychology, being psychoanalysis the mainly orientation.

When he assumed the chair of Contemporary Psychology (1953–1956), the psychoanalytic perspective was emphasized and then it was continued by Dr. Jorge Galíndez (1912–1986), his successor and also a recognized pioneer of Psychology in Tucumán (Ventura, 2009).

In 1956, after *de coup d'état* in the country, the dean of the Faculty of Philosophy and Humanities ordered the rescission of his contract for political reasons, supported by a national regulation which declared all university professors “on commission,” that is, that they could be dismissed from their positions (República Argentina, 1955). In 1958, after his suspension was revoked, he returned to the university and worked continuously until his retirement in 1982. When the Program of Psychology was created in 1959, he resigned the Pedagogical Psychological course to assume the chair of *Métodos y Técnicas de Exploración Psicológica* (Methods and Techniques of Psychological Exploration) based on the Thematic Apperception Test (TAT) and *Psicodiagnóstico* (Psychodiagnostic) with orientation in Rorschach.

Moreno and Oñativia had a leading role as technical secretaries of the organization in the First Argentine Psychology Congress (1954) held in Tucumán, which was convened by three different institutions at National University of Tucumán: the Educational Science Institute, the Philosophy Institute, and the Psychotechnics and Professional Guidance Institute (Klappenbach, 1996). Moreno and Oñativia intended to include at least two issues on agenda of the congress: (1) to make an historical and epistemological report of psychology in the world; (2) to promote a declaration about the need for the creation of the university program in psychology in the whole country (Ventura, 2009).

Finally, such declaration was written by the professors Ricardo Moreno and Oscar Oñativia and then, checked by Professor Plácido Horas (1916–1990) and endorsed with the signatures of Juan Luis Guerrero (1899–1957), Eugenio Pucciarelli (1907–1995), Alfredo Palcos (1862–1930), Francisco González Ríos, Carlos

Astrada (1894–1970), and Luis María Ravagnan (1902–1984). The text was approved unanimously although there was no equal consensus regarding the place of insertion, whether in a humanistic or medical context.

The proclamation recommended a humanistic, anthropological, and broader orientation of the psychology program than simple application to the field of work or education (Ventura, 2009). In fact, within the following 5 years of this Congress, psychology programs were created in six of the national universities (Rosario, Buenos Aires, La Plata, Cuyo, Córdoba and Tucumán), and in two private universities, so it can be marked as a milestone in the history of psychology in Argentina.

It is important to note that in almost all cases, those who had signed the declaration, or who as active members had voted for its approval, were involved in creating the new psychology programs.

In 1959, Ricardo Moreno was the head of the Department of Psychology in the Faculty of Philosophy and Humanities at National University of Tucumán and since 1964, vice dean of the same institution.

As stated by Moreno (Ventura, 2009), the psychologist needed a professional image that identified them with the clinic orientation. For that reason, he promoted the entry (1962) of psychoanalysis into the program with the arrival of Andrés Nader (1928–1986), who specialized with Harald Schultz-Hencke and later organized the chair of Deep Psychology (Estofán de Terraf 2011, p.40).

With the arrival of Nader at the psychology program, Moreno had deepened his training in this particular psychoanalysis, while he began his private practice as a therapist that continued until his death (Estofán de Terraf, 2011, p.17).

In 1961, Moreno represented the Universidad Nacional de Tucumán (National University of Tucumán) at the UNESCO, and during that year, he received training in Padua (Italy) as an intern (Ventura, 2009).

In 2014, he was appointed as professor emeritus by the Universidad Nacional de Tucumán (National University of Tucumán) during Juan

Alberto Cerisola (1949–) principalship (2006–2010) in recognition of his pioneering work in psychology (Anónimo, 2012).

In conclusion, “Professor Moreno was due to his academic and human stature, a cornerstone in the architecture of what it is today the career of Psychology at this University (. . .) he has also been a beacon that illuminated the training of generations of psychologists from the Argentine Northwest” (Contini de González, 2004, p. 21).

Morey Otero, Sebastián

Born *Montevideo, (Uruguay), 16 February 1894*

Died *Montevideo, (Uruguay), 7 January 1939*

Jorge Chavez Bidart
Facultad de Psicología, Universidad de la República, Montevideo, Uruguay

Keywords

Uruguay · Experimental psychology · Psychopedagogy · Education

Sebastián Morey was born in the city of Montevideo; he started his studies at the Institutos Normales de Varones (Men’s Normal Institute) in the year 1910, obtaining his titles of 1st Grade Normalist Teacher and National 2nd Grade Teacher on 1913. The next year, he joined Normal Institutes as a professor, holding a chair of Morality and Constitution (Maggiolo 1939).

At the time he was appointed to the chair of Morality and Constitution to Normal Institute, the country found itself in a delicate situation when it

came to education; it demanded the training of “civic spirit” in citizenship between the leaders of educational institutions, in order to nail down the nation project made by the batllismo. Such designation is used to name the political experience that took place in the first three decades of the twentieth century which revolved around the action and thoughts of José Batlle y Ordoñez (1856–1929). The Pedagogical Society, created in 1920 and integrated by prominent intellectuals, made a proposal about civic training that consisted in being part of the school plans (Sociedad de Pedagogía 1924).

In the words of Sebastián Morey Otero (1924), it was decided that the first item would refer to the cultivation of patriotism; his proposal indicated to initiate the student in the knowledge of the government’s institutions, rights, and civil/political duties. The purpose of this was that the student acquired the sensation that civic life was a live reality and that the basis of civic culture was synthesized in the idea of patriotism. Morey Otero (1925) considered that: “As to the effects of its cultivation, patriotism, more than a simple feeling, must be dealt as a spiritual energy that forms an essential part of a system with representation in diverse aspects in the personality of the pupil” (p. 36).

In this context, Morey Otero elaborated various texts used in the school education: *Moral. Libros de textos para los alumnos de las Escuelas Públicas* (Moral. Books with texts for students that attended public schools) (1918), *Patria* (Homeland) (1925), and *Civismo. Nociones de Instrucción Cívica para los años 5° y 6° de las Escuelas Públicas* (Citizenship. Notions of Civic Instruction for 5th and 6th grade of public schools) (1937). In *Moral*, Morey Otero identifies and runs through, one by one, all of the expected behaviors in the relationship between the citizen and the homeland; he highlights that the homeland, as an organized society, needs the fulfillment of the civic duties, tax payment, military service, and the duty of suffrage.

At the start of the 1920s, he got a scholarship from the Uruguayan government to study in Europe. In Madrid, he followed courses by Gregorio Marañón (1887–1960); in Barcelona,

he attended the institute directed by Emilio Mira y López (1896–1964). In France, he was an assistant in the institute directed by Henri Pierón (1881–1964) and in Italia, at the Pende (1880–1970) Institute. This experience was the key to carry out the first initiatives in the Normal Institutes to orient school psychology in an experimental framework. The psychology taught in the education of Magisterio (institution of teacher’s formation) inspired by Herbart was found obsolete while also being theoretical and far away from the reality of the school. This situation was sustained by those who ran the destination of primary school (Chavez Bidart, 2016).

In January and February of 1925, Morey Otero dictates the first small experimental psychology course, in which 83 teachers and students of the whole country took part. The course was divided into a theoretical part and a practical one, developing simple experiences and result discussion. The next year, the teacher training, in the Instituto María Stagnero de Munar (Ladies’ Normal Institute), included a course in psychopedagogy, with a clear orientation toward experimental psychology that had its fair share of resistance (Morey Otero, 1928), but that was equally accepted by the new teaching generation. The orientation of the teacher training in that moment did not recognize the impact of psychology, biology, and other disciplines in the pedagogic work and student orientation; Morey Otero (1928) expressed that this would not change “until the teaching career doesn’t surround itself with essential scientific guarantees, in respect of the teacher training and practice” (p. 221). In order to take on this idea, he proposed performing deliberately planned observations, to acquire positive results, which he denominated “pedagogic experiments.” To Morey Otero (1928), the developments of experimental psychology influenced the teaching educational practice, contributing to the creation of differential classes in institutes of vocational and professional orientation, to the *New School* movement, and to the educational individualization. He claimed that teachers cannot be outsiders to these advances, and should know about them to apply them into their assignments/job. The generations that culminated the courses in 1926, 1927, and

1928 contributed a nucleated group of interested people in psychopedagogy, at the request of Morey Otero, which turned out to be the first scientific society in psychology: the Alfred Binet Association.

The *Anales de Instrucción Primaria* (Annals of Elementary Education) started to publish works by the students of these courses at the request of Morey Otero, who integrated its editorial committee. Morey Otero accompanied this disclosure activity heading the Normal Institutes radio program called “The Time of Normal Institutes” that broadcasted on CX 22. In this new period focused on psychology, Morey Otero (1930) edited a work for the university and teaching courses addressing historical and philosophical aspects of psychology. The work contributed with a look at diverse cultures, highlighting thinkers and approaches to psychology, going from Greek and Roman psychology, and culminating with psychology as a positive science.

On September 13, 1933, the Consejo Nacional de Enseñanza Primaria y Normal (National Council for Elementary and Normal Education) created the laboratory of experimental psychopedagogy, on the motion of Morey Otero. The laboratory was dedicated to psycho-pedagogic research, developing special worksheet of the normalist students and preparing norms for the scientific appreciation of the school performance.

He would contribute to the student’s exam for the special classes and also practice the professional orientation with students that graduated from public schools and also organize free courses for normalist teachers and students, about scientific pedagogy, experimental psychology, positive psychopedagogy, professional selection, and orientation. Morey Otero made significant contributions to the advance of the laboratory, like the creation of the Psychopedagogy File and the creation of the mental test of the “Fosforito” (Small match). He was also the head of the Pedagogical Library. When he passed away on January 7, 1939, he was the Director of the Normal Institutes.

Enrique Mouchet was the son of Carlos Mouchet and Elena Pouget. He married Rosa Bernstein, with whom he had two children, Eugenia and Mauricio. After completing his high school studies, he simultaneously began studies in the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) and the Facultad de Ciencias Médicas (Faculty of Medical Sciences), both at the Universidad de Buenos Aires (University of Buenos Aires). In 1910, he obtained his degree in philosophy with the dissertation *Examen sobre el Concepto de identidad* (Examination on the Concept of Identity) published in the same year by the prestigious Printing Coni. In 1914, he obtained his doctoral degree in Medicine with the dissertation *Introducción a la Fisiología y Patología del espíritu o sea la naturaleza del alma* (Introduction to the Physiology and Pathology of the Spirit or the Nature of Soul) which was directed by Bernardo Houssay (1887–1971), the future Nobel Prize in Medicine (Mouchet, 1914).

Between 1912 and 1914, Mouchet joined, as an assistant, the experimental psychology laboratory directed by Horacio Piñero (1869–1919), whose laboratory head was Pastor Anargyros (Rodríguez-Sturla & Ferro, 2019). By the end of 1919, he was appointed Professor of Psicología Fisiológica y Experimental (Physiological and Experimental Psychology) at the Facultad de Filosofía y Letras (Faculty of Philosophy and Humanities) at the Universidad de Buenos Aires (University of Buenos Aires), remaining in that position for more than two decades until 1943. At the same time, in 1922, he was appointed Professor of Psychology at the Facultad de Humanidades y Ciencias de la Educación (Faculty of Humanities and Educational Sciences) at the Universidad Nacional de La Plata (National University of La Plata, UNLP). In the latter institution, he became professor of a free course of contemporary philosophy from 1926 until his resignation in 1929, he directed the journal *Humanidades* (Humanities) from 1923 to 1926 and reached the deanship between 1925 and 1926. In 1930, he resigned from his positions at the UNLP due to the criticisms that the reformist sectors led by Alejandro Korn (1860–1936) and

Coriolano Alberini (1886–1960) focused on his positivism (Graciano, 2015). In other words, Mouchet had an academic insertion for a little more than two decades.

At the University of Buenos Aires, he created in 1931 the Institute of Psychology, for which he was the director until 1943. He also founded and directed the *Anales del Instituto de Psicología* (Annals of the Institute of Psychology) between 1935 and 1941 (Klappenbach, 1997). A year earlier, he had reorganized the former Society of Psychology, which had existed between 1908 and 1914 under the name of Society of Psychology of Buenos Aires. He was its President in several periods: 1930–1932; 1936–1938; 1942–1945; 1945–1952; 1956–1958; 1958–1961; and 1961–1964 (Klappenbach, 1997).

Ardila has classified Mouchet's contributions in four major areas: (1) theory of thought and language; (2) the tactile perception used by blind; (3) the theory of emotion; and (4) the theory of vital psychology (Ardila, 2000). If to these contributions we add a fifth area, related to psychopathology in general, especially depersonalization processes, it can be seen that Mouchet covered very varied fields of psychology.

One of his major works was *Percepción, instinto y razón* (Perception, instinct, and reason), subtitled *Contribuciones a una psicología vital* (Contributions to a Vital Psychology) (Mouchet, 1941). Mouchet emphasized that the *vital* in his psychology “has nothing to do with Bergson, nor with Husserl, nor with Heidegger” (Mouchet, 1941, p. 14). On the contrary, Mouchet emphasized that vital psychology considered the soul as something living, nothing objective, but purely subjective, although it is exteriorized in somatic and therefore objective manifestations *within certain limits* (Mouchet, 1941). Mouchet considered that his *vital psychology* did not have an ontological status, but a *methodological* one, since his system was based on the *feeling of life*, which constituted the “irreducible principle of *objective and subjective knowledge*” (Mouchet, 1941, p. 15) and “the central nucleus of the other modes of sensibility,” including “of all mental life” (Mouchet, 1941, p. 25). In short, the *feeling of life* was the foundation of external perception

and of concepts such as time, space, unity, and causality. For this reason, it constituted the first empirical data in any research on psychological processes, the onto- and phylogenetic starting point and the foundation of Mouchet's theoretical formulations (Klappenbach, 1997).

In his classical work *Psicología en América Latina. Pasado, presente y futuro* (Psychology in Latin America. Past, present, and future) published by Ruben Ardila in 1986, Mouchet's *Vital Psychology* has been considered as one of the three original theoretical systems in Latin American psychology, together with Ingenieros' *Genetic Psychology* and Walclaw Radecki's *affective discriminationism*. However, only Mouchet's book was included in the list of the 100 most important books in psychology; the other Latin American was a text by Ezequiel Chavez (Ardila, 1974). Ardila considered that Mouchet's book integrated "perceptive, instinctive and cognitive factors" in a "highly original" way (Ardila, 1974, p. 201).

Indirectly linked to the *feeling of life*, Mouchet also excelled in the investigation of the perception of obstacles in blind people, where he followed the experiences of Pierre Villey (1879–1933). Mouchet demonstrated that this perception was not due to a special cutaneous sensation, but to a sensation perceived in an auditory way, although not of sonority. Mouchet differentiated between the functions of the *cochlear portion* of the membranous labyrinth, responsible for sound sensations, and the *vestibular portion*, responsible for at least three functions. First, the internal sensations of head position, as analyzed by Pierre Flourens (1794–1867), Friedrich Goltz (1834–1902), Josef Breuer (1842–1925), Ernst Mach (1838–1872), and Alexander Crum-Brown (1838–1922). Second, the sensations of bodily equilibrium, as Ernst Julius Ewald (1855–1921) and Luigi Luciani (1840–1919) had studied. And third, the sensation of "presence" of an object placed at a distance, according to Mouchet's own research (Mouchet, 1938, 1941).

Mouchet had a wide recognition in the region. The *Annals of the Institute of Psychology* intended to become "a specialized organ for all Latin American psychologists," as Mouchet stated in the

Preliminary Words of the first issue (Mouchet, 1935, p. 12). In fact, that would begin to be verified in the second volume published in 1938. In the same direction, his book *Nuevos tratamientos de los estados esquizofrénicos* (New treatments for schizophrenic states) (Mouchet, 1943) was reviewed in Brazil in the third issue of the prestigious *Arquivos de Neuro-Psiquiatria* (Neuro-Psychiatry Archives). Juan Cuatrecasas (1899–1990) considered Mouchet among the most eminent specialists of the American continent. But his international recognition was even broader. In 1929, he participated in the *Ninth International Congress of Psychology*, held at Yale University, in New Haven, Connecticut. Mouchet presented two papers there: (1) *La perceptibilité tactile de l'aveugle* and (2) *L'image verbo-visuelle dans le mécanisme de l'intelligence*. In turn, his book *Perception, Instinct and Reason* was reviewed by Babette Samelson (later Babette S. Whipple) in *The Journal of Abnormal and Social Psychology*, a publication initiated by Morton Prince (1954–1929) in 1906 under the name of *Journal of Abnormal Psychology*. In 1921, under the editorship of Floyd Allport (1890–1979) and Prince himself, the journal emphasized the interrelationship between clinical and social psychology and in 1925, that interrelationship was reflected in a change in the name of the journal (Hill & Weary, 1983). The book review highlighted the differences between American and Argentine psychology. And the conclusion of the review, taking into account such interrelation between social and psychopathology that characterized the publication, can be considered as an eloquent praise to Mouchet's book: "Furthermore, their interest is primarily in the broader aspects of behavior, and they consequently tend to rely more heavily on clinical data than on laboratory facts in their attempts to elucidate the basic nature of personality and perception" (Samelson, 1942, p. 422).

Finally, in 1932, Mouchet was the Argentine contributor, a sort of associate editor, to the celebrated third volume of the *Psychological Register*, edited by Carl Murchison (1887–1961). The book represented the greatest systematic effort up to that moment in the elaboration of an international

directory of psychologists and the compilation of the psychological bibliography in a truly international perspective (Murchison, 1932). This again highlighted the international recognition achieved by Mouchet, even if the New Haven congress had facilitated Murchison's meeting with Mouchet (Benjamin & Barker, 2012). Indeed, to put Mouchet's stature in perspective, it is worth noting those who played the same role as Mouchet in Argentina: Henri Pieron (1881–1964) in France, David Katz (1884–1953) and Kurt Lewin (1890–1947) in Germany, Frederic Bartlett (1886–1969) and Charles Spearman (1863–1945) in England, Albert Michotte (1881–1965) in Belgium, Sante de Sanctis (1862–1935) in Italy, Édouard Claparede (1873–1940) in Switzerland, Karl Bühler (1879–1963) in Austria, and Aleksandr Luria (1902–1977) in the Soviet Union, among others (Murchison, 1932).

Mouchet also practiced clinical psychiatry, both in his private practice, located at the charming 1159 Callao Avenue, in the heart of the sophisticated *Barrio Norte* (Northern Neighborhood) in Buenos Aires city, and in the neuropsychiatry clinic in Temperley, a suburb half an hour away from Buenos Aires, which he also directed (Mouchet, 1966). At the same time, he participated in the activities of the Socialist Party. His concern for the *social question* was shared by other intellectuals in those years, such as Enrique del Valle Iberlucea (1877–1921) or Alfredo Palacios (1878–1965) and had begun in his student years (Graciano, 2015). He was a national deputy for two periods, 1932–1934 and 1934–1938. His parliamentary activity was mainly directed towards educational and university issues. His first draft bill established the system for the appointment of secondary school teachers on the basis of their record. He also proposed a bill establishing the representation of elementary teachers on the board at the Consejo Nacional de Educación (National Education Council) and an organic law on physical education. Likewise, a draft university law drafted jointly with Alfredo Palacios and a draft for the creation of the National Council of Technical Education (Foradori, 1941). He also presented

draft bills related to health and children. These included a draft bill against leprosy, a draft bill creating the Institute of Paralysis and another one establishing the inspection of clinic devoted to mental illness. His last draft bill promoted the creation of the National Children's Department (Foradori, 1941).

Mouchet acknowledged his debt to Horacio Piñero and above all to José Ingenieros (1877–1925), of whom he considered himself a disciple (Mouchet & Palcos, 1925). His references to authors such as Théodule-Armand Ribot (1839–1916) and Georges Dumas (1866–1946) were constant, but also to Bergson (1859–1941), Scheler (1874–1928), von Uexküll (1864–1944), Köhler (1887–1967), or even Freud (1856–1939). Such a broad scope was not only due to an undoubtedly encyclopedic conception but also to an effort of synthesis in the domains of psychology in which he specialized: the phenomena of emotion, the perception of obstacles in the blind, vital feeling, and some psychopathological phenomena such as depersonalization, derealization, and language disorders. On the other hand, Mouchet was a central organizer of various institutions of psychology over several decades.

Maria Lacerda de Moura is widely recognized in studies approaching the history of feminism and anarchism but she is still a poorly known character in the fields of psychology and education, in which she engaged as a teacher, a researcher, and author.

In 1904, she completed the graduation at the *Escola Normal* of Barbacena in Minas Gerais state – a second grade teacher-training school –

where she became a teacher and taught from 1908 on. Bearing a spiritist and anticlerical background, she gradually built up a public role as a social reformer and defender of female causes, including the right to vote. She had an outstanding participation in the foundation of the Barbacena League Against Illiteracy, a mother's milk bank and a village for the city's low-income inhabitants.

She worked for 11 years at the *Escola Normal* of Barbacena, teaching, researching, and writing works on teacher training. In lockstep with the debates of her time, which were sponsored by republicans, Maria Lacerda de Moura attributed to the school the role of promoting social democratization, through the universalization of education. In order to accomplish it, education should be based on scientific principles that would guarantee its efficiency. She taught pedagogy and hygiene and was the head-chief of the Pedagogium, an institution attached to the *Escola Normal* focused on the students' teaching practice. In order to expand her performance, she developed studies and works aiming to divulge the scientific principles of education. She focused on the spreading of the most recent productions of psychology, understood as a science that renews education. Such productions were marked by a transition between a physiological psychology and the construction of a theory of psychic functions, to be applied in education. In her works, Maria Lacerda de Moura defended the investigation of students' psychological diversities, according to their ages, identifying individual differences and organizing classes according to children's learning abilities. Her studies were based on the understanding of the physiological and mental functions of childhood, approaching, at first, the sensations, perceptions, and attention, in order to come, later on, to conclusions on their derivatives: learning, motivation, and social influences, called higher mental functions.

She argued that nature and experience would be sources of learning in childhood, advocating the use of experimentation, observation, and other scientific methods in the development of an active education for the child. Maria Lacerda de Moura placed greater emphasis on psychology, signaling

the primacy of this science for the constitution of scientific pedagogy: "it is the psychological science applied to the art of education" (de Moura, 1925, p. 19). The importance of psychology for pedagogy lay in the fact that this science offers the teacher procedures of experience and methodology capable of revealing data about the students and, consequently, making it possible to ponder educational actions based on the children themselves, from their physical and mental state. Maria Lacerda de Moura emphasized that, far from being abstract and analytical, the psychology applied to education should be alive and concrete, since it was grounded on the child's own life and actions (Guimarães, 2020). Experimental psychology would help to gather data about the senses and physical and mental development. For the author, the teacher should not only master psychological knowledge, but also act as a researcher in the classroom. Thus, in 1919, Maria Lacerda de Moura wrote a project of experimental psychology applied to pedagogy, which was submitted to the state government's appreciation, remarked as the first attempt to use tests in schools in Minas Gerais. In this project, she demanded to carry out experiments focusing on tests and observation of students at schools in the city. The project was under analysis for almost 2 years, facing resistance from the state's educational authorities. When finally approved in 1921, Maria Lacerda had already left the institution. It ought to be underlined that, at the time she wrote the project, such studies were recent and still incipient in their dissemination, which highlights the pioneering spirit of her initiative.

Leaving the *Escola Normal* was a consequence of her gradual withdrawal from education. In a context of political and social unrest, with the growth of anarchist and communist parties in Brazil, Maria Lacerda de Moura radicalized her political positions, distancing herself from a republican view of belief in the reformist role of education, toward a revolutionary perspective, founded on the anarchist ideology. Facing hostilities in Barbacena and willing to get closer to social movements, she moved to São Paulo in 1921, when she actively participated in several

feminist and union movements (Leite, 1984), establishing herself as an important political leader. Her libertarian ideals led her to settle in an anarchist community in Guararema (SP), a period during which she developed intense intellectual production. More than 15 of her works were published. She wrote articles and addressed lectures not only in Brazil, but also in other countries, such as Argentina, Uruguay, and Spain.

Her production was extensive and diverse, reflecting the changes in her trajectory. Her books and articles approached the psychology applied to childhood and women and the defense of feminism. As Maria Lacerda de Moura herself stated in her first published book: “All my ideas gravitate towards women and children. And this book will be an introduction to other books that I have been writing for a few years, and that will deal more widely with the problem of education, child psychology, female psychology” (de Moura, 1918, p. 6). Some of these titles, especially those defending feminism, have been translated and published abroad.

Maria Lacerda de Moura died at the age of 57, in Rio de Janeiro. Her contribution to psychology was made not only for Brazil, but for all the countries in which her works were divulged, especially in Latin American countries.

Puerto Rico · Social-community psychology · Gender issues and divorce

Dr. Marya Muñoz Vázquez has challenged long-held conceptions in psychology during more than 30 years. Her intellectual contributions have impacted the clinical and social-community research areas. Her mother, Beatriz Vázquez Berríos, was an educator with a master’s degree in Preschool Education, who worked in the Head Start Program. Her father, Luis Muñoz Rivera, was accountant, lawyer, senator from 1960 to 1968, and member of the Constituent Assembly of Puerto Rico, a group who wrote the Constitution of Puerto Rico in 1952.

Dr. Marya Muñoz Vázquez graduated from the University of Puerto Rico High School in 1961. In 1965 she earned her BA in Psychology, at the University of Puerto Rico, Río Piedras Campus

(UPR-RP). She got married in 1963 and had a child, Miguel Valcourt Muñoz. Since 2001, she shared her life, dreams, and love with Octavio J. Santi Figueroa until he passed away in March 2019. Her first jobs were as a teacher in Head Start and at her *alma mater* University High School. In 1974 she earned her master's degree, MA, in Psychology at the University of Puerto Rico and finished a doctorate degree in Counseling Psychology at the University of Missouri in 1978. She was hired by UPR-RP as professor at the Department of Psychology, Social-Community Program. From 1978 to 1997, she taught graduate and undergraduate courses, supervised theses and dissertations, mentored students, and did research in social issues.

Dr. Muñoz Vázquez's most powerful contributions to the field were in gender relations, small group processes, and dominant social standards. She coauthored a book with Dr. Edwin Fernández Bauzó, which revealed and revolted the social meaning of divorce, provoking enormous interest in the press and media, government agencies, and interest groups in Puerto Rico. They argued that divorce – in the US American society – is characterized as an individual event, as a failure of the people involved, due to the absence of the social meaning of marriage in today's society, meaning that we begin to understand when discovering the difficulties that men and women face in their relationships. They proposed that divorce is a product of the conditions that arise from the intersection between the specific form of family organization that frames the relationships of the spouses (patriarchy) and the socioeconomic conditions that they face and that are the result of the economic organization. The components of patriarchy – division of labor by sex, the authority of the husband, and man's sense of ownership over the woman – affect the male-female relationship. The authors concluded that divorce is not a failure of the couple, but rather a form of resistance – albeit absent from social reflection – which reflects the need to transform structures of oppression and subordination to make way for fairer and more egalitarian and solidaristic relationships. Ignacio Martín Baró invited her to publish about

divorce and its theoretical explanations in a journal published by the Central American University José Simeón Cañas, in El Salvador.

Another important contribution to the field of Dr. Marya Muñoz-Vázquez was to make visible the relation between Community Psychology and the social movements in topics such as power, power of women, community organization, action research, and empowerment, all of which should be analyzed within the vision of Social Movements. She wrote and spoke about community struggles and the power of women in social movements and politics. About these issues, she says: "I argued that the feminist movement has, like other social movements such as the student movement, a multi-class character. Due to this, it faces the difficulty of articulating common objectives between what are sectors with different class interests despite going through common experiences of oppression due to their gender condition. There is no feminism but several and different approaches to the oppression of women and the strategies to follow" (M. Muñoz Vázquez, Personal communication, June 16, 2020). In 1989, Dr. Marya Muñoz edited a book about state brutality and recognized the role of psychology in the structural violence of the state against a woman political prisoner.

As Dr. Marya Muñoz Vázquez has discussed, the intersection between social class and gender oppression brought the need to reflect on the forms of collaborative research by social researchers that can contribute to women's community struggles. In 1988, she wrote an important paper about occupational and environmental health. She continued her work on some of these links through collaboration projects about environmental and health struggles with broad participation of women. The agenda was dictated by the needs of women in the struggles and approaches of Community Psychology with a group of women workers in the clothing industry who were affected by gas emissions entering their workplaces. The toxic gasses affected hundreds of women, which led to medical diagnosis such as rhinitis, peripheral neuropathy, conjunctivitis, and memory, coordination, and concentration

problems. With the contribution of social, clinical, and neuropsychologists, the effects of the toxic gases on the workers' health were demonstrated: the gases were affecting the functioning of their central nervous system. The knowledge derived from these women's struggles for their health and well-being and their organization and strong collaborative leadership were recognized in the intersection of gender, community struggles, and environmental movement. Dr. Muñoz Vázquez was invited to discuss these issues at US Hunter College, at the Center for the Study of Women and Society, City University of New York in 1991, the Eco '92 World Conference in Brazil, and, in 1995, 3rd World Conference on Chinese Women.

Dr. Muñoz Vázquez's passion for small group work and group dynamics brought her to be a trainer from 1976 to 1984 with the National Training Laboratories Institute in the United States, an institute where the method of education based on experience was developed.

Dr. Muñoz addressed sound positions on topics of sexual harassment, women sexuality, community sources of knowledge, families in public housing and their legal rights, and domestic violence. In 1989 she coauthored a study on female sexuality. She also conducted academic work on racism with colleagues which included the Puerto Rican Civil Rights Commission. In 1994–1995 she was a designated member to the Commission to Study Gender Bias in the Courts to analyze discrimination by gender biases in the Puerto Rican court system, producing a report that was published by the Supreme Court in 1995.

In 1989, the Puerto Rico Psychology Association named her Psychologist of the Year.

Since her retirement in 1997, she has been very active as a consultant, educator, and researcher on topics such as domestic violence, group dynamics, and women's health, among others. She was advisor to the Social Summit, a group that brought together different sectors of civil society to analyze issues such as globalization of the economy, environmental issues, work, and health, among others. Her ongoing community work with the group *Collective Ideologies and Experiences of the Genders* and her insights on local politics keep her writing and publishing (2011).

Brazil · Social psychology · Creation of a psychology society

The daughter of an Italian immigrant father and a Brazilian mother, Gioconda Mussolini attended primary school at Regente Feijó School and Brás Model School in the city of São Paulo between 1922 and 1926. She entered Padre Anchieta Normal School in 1929, where she earned the title of Primary School Teacher. As a complement to this training, between 1933 and 1934, Mussolini completed the Continuing Education Program for Primary School Teachers at Caetano de Campos Institute of Education, popularly known as “Escola da Praça” [School of the Square] due to its location in Republic Square. This course was equivalent to the first 2 years of the Pedagogy Program of the School of Philosophy.

At the normal school, the study of psychology was both theoretical and practical. Procedures were performed in a laboratory where future teachers had access to psychometric, anthropometric, electrical, and sensation- and memory-related instruments and devices (Centofanti, 2006) to physically and mentally examine their students.

In 1934, when the University of São Paulo (USP) was founded and the Institute of Education was incorporated, Mussolini worked as a teacher in São Paulo schools and as a researcher of *The Standard of Living of Workers in São Paulo* project, a study coordinated by Horace Davis (1898–1999). In the following year, she enrolled as a student in the Political and Social Sciences Program of the School of Philosophy, Sciences,

and Arts (abbreviated as FFCL in Portuguese). As an employee of the Municipal Department of Culture of São Paulo, she participated in studies titled *The Standard of Living of Garbagemen in São Paulo* and *Philanthropic Care in the City of São Paulo* conducted by Samuel Lowrie (1894–1975) and Bruno Rudolfer (1894–1942) as well as by professors from the Free School of Sociology and Politics of São Paulo (abbreviated as ELSP in Portuguese), which is currently the Sociology and Politics Foundation School of São Paulo (abbreviated as FESPSP in Portuguese).

Considered milestones in the development of sociology in the country, the two studies on the standard of living of workers contributed to the combination of theoretical knowledge with empirical research and to making such knowledge applied, as the results were used for the implementation of a minimum wage in the country (Del Vecchio & Diéguez, 2009). Both studies reflected the purpose of the founding of the ELSP, which was to study problems of the Brazilian context by reorganizing the country’s economy and politics (ELSP, 1942) according to the expectations of São Paulo elite who drove the creation of the FFCL (Candido, 1996). This political context of scientific production responding to the demands of Brazilian society was shared among various social sciences and humanities disciplines, which led to an invitation for European professors to come to the FFCL and, primarily, for American professors to come to the ELSP.

According to Ciacchi (2015), these intellectual and social conditions helped awaken in Mussolini an interest in a teaching career in higher education. With the completion of her degree and as a graduate, in 1938 she initially joined the Center for Social Research and Documentation as a member and then became a teaching assistant and sociology chair I at the FFCL/USP. In 1944, Mussolini was commissioned to the anthropology chair of the same school, assuming the roles of graduate teaching assistant and first and second assistant. In this position, she taught a course titled *Introduction to Anthropology with an Emphasis on Personality and Cultural Problems* offered through the Psychology Program (Bosi, 1994).

Given the prestige of psychology at the time and with the goal to contribute to the development of psychology as a form of scientific knowledge and professional practice, in 1945, the Society of Psychology of São Paulo, currently the Psychology Association of São Paulo (abbreviated as APSP in Portuguese), was created. This institution served as a space in which those interested in psychology and related disciplines such as anthropology, ethnography, and physiology (Morais & Witter, 1996) could participate in lectures and courses. Mussolini, a founding member of the society, presented a discussion of racial and national stereotypes in 1949 and of anthropological methods of personality research in 1954. At other institutions, as part of an *adolescent psychology* extension course, she addressed topics such as childhood, adolescence, education, and the initiation rites of aboriginal peoples.

Mussolini's participation in these events was connected to her studies and research, which, despite being considered from the anthropological field, combined knowledge from various sciences such as history, geography, sociology, and psychology. This connection is evident from Mussolini's master's thesis and from her publications related to fishing, in which she analyzes social groups based on individuals' regulation of emotions, ideas, and feelings, demonstrating her understanding of psychology as a social discipline and as a study of personality and culture and contributing to the development of social psychology throughout her training and professional practice (Goes, 2016).

Mussolini's intellectual production was marked by her commitment to social issues and to the construction of scientific knowledge in Brazil. She was sensitive, restless, and driven with a demanding mental life and a taste for debating books and ideas (Candido, 1980). When Mussolini's students remember her, they speak with affection about her enthusiasm for her classes, and they recall not wanting her classes to end so that they could continue listening to and discussing the ideas she presented (E. Bosi, electronic mail, May 31, 2014).

Keywords

Argentina · Experimental psychology · Comparative psychology · Founding member of laboratories and scientific societies

Dr. Alba Mustaca was initially trained at the School of Social Assistants of the Facultad de Derecho y Ciencias Sociales (Faculty of Law and Social Sciences, UBA), obtaining her degree in 1965. She then graduated as a Licenciada en Psicología (A person with a degree in psychology)

in 1972 from the Facultad de Psicología (Faculty of Psychology, UBA). Finally, she obtained her Doctor of Psychology degree from the Universidad Nacional de San Luis (National University of San Luis), Argentina, in 2001, whose dissertation was entitled *Frustración: Efectos inmunológicos y agonísticos* (Frustration: Immunological and agonistic effects). She received several awards, including the “Rubén Ardila Award for Scientific Research in Psychology in 2005” (this Award is granted by the Fundación para el Avance de la Psicología –Foundation for the Advancement of Psychology).

Dr. Mustaca has contributed to establishing an area that was vacant in Argentina, experimental psychology in general (and comparative psychology in particular) as a field of specialization for professionals in psychology. She had a leading role in the development of this area of study at the Faculty of Psychology (UBA) since the beginning of the 1980s, being in charge of the undergraduate courses on Methodology of Psychological Research, General Psychology, Introduction to the Psychology of Learning and Analysis and Modification of Behavior until the end of the 2000s.

During the 1980s, she also worked as visiting professor of comparative animal physiology (Comparative Psychology section) in the Department of Biology of the Facultad de Ciencias Exactas y Naturales (Faculty of Exact and Natural Sciences, UBA) and participated in the Training Seminars in Behavioral Sciences that were organized in the vivarium of that faculty.

Throughout her career, she has given several undergraduate and graduate courses in other institutions in the country, as well as abroad, such as the Universidad Nacional de Colombia (National University of Colombia) or the Universidad Autónoma del Perú (Autonomous University of Peru). Currently, she works as professor-researcher and permanent professor of the Integration Seminar-Workshop and the Thesis Workshop of the Facultad de Psicología y Relaciones Humanas (Faculty of Psychology and Human Relations) at the Universidad Abierta Interamericana (UAI; Interamerican Open University).

In her research area, she created the Laboratorio de Psicología Experimental y Aplicada (Laboratory of Experimental and Applied Psychology, PSEA) at the Instituto de Investigaciones Médicas (Institute of Medical Research, IDIM) dependent on both the UBA and the Consejo Nacional de Investigaciones Científicas y Técnicas (National Council of Scientific and Technological Research, CONICET) in 1993, which she directed until 2014. From this laboratory, she promoted the scientific study of animal behavior in the field of psychology, becoming a place of reference for those students or psychologists interested in experimental training. The backbone of her research was the psychology of learning and particularly the phenomenon of frustration, understood as the reaction that occurs when events negatively contradict the expectancies that an individual has formed. She studied this phenomenon in animal models through the Successive Negative Contrast procedure, in which subjects experience an unexpected devaluation or omission of a reinforcer. In this framework, she has conducted studies with various species, including humans, although most of her work was carried out on rats (e.g., Pellegrini et al., 2004).

Numerous lines of research were developed around the analysis of this phenomenon, among them, the relationship of frustration with relevant social behaviors such as aggression and sexual behavior, the ontogenetic development of this phenomenon, evaluating it both in infant as well as old rats, and the investigation of the impact of other experiences such as exposure to novel stimuli, isolation, and early stress. Many of her works also included the evaluation of the physiological correlates of frustration, especially through the measurement of the effect that some drugs produced on it (e.g., the measurement of the effects of alcohol, anxiolytic drugs, and memory-modulator drugs; see Bentosela et al., 2006; Ruetti et al., 2014; Suárez et al., 2014, among others). Likewise, she analyzed the impact of frustration on health, venturing into the area of psychoneuroimmunology. Finally, throughout these years and even today, her contributions have been extended to the study of human behavior, with special emphasis on the evaluation of frustration and emotional regulation processes in children and

adults, as well as the study of effectiveness of various interventions for behavior modification.

The development of these lines of research was accompanied by the establishment of collaborations with numerous researchers, not only in the field of psychology but also in many other disciplines. This exchange expanded beyond the local sphere, including researchers from abroad, both from Latin America and the United States (e.g., Mustaca et al., 1991; Papini et al., 1988) and Spain (e.g., Cuenya et al., 2012).

Regarding the training of human resources, she was director of several doctoral and master's theses, as well as undergraduate theses at different national universities. In turn, she directed several fellows and researchers at CONICET.

Her scientific production includes the publication of numerous books and book chapters, more than 150 scientific articles in national and international journals of her specialty, and more than 300 communications and talks at conferences (both in the country and abroad).

Finally, Dr. Mustaca is a founding member of the Asociación Argentina de Ciencias del Comportamiento (Argentine Association of Behavioral Sciences, AACC), a very influential society dedicated since 1987 to the promotion of the scientific study of psychology and National Member of the International Union of Psychological Science –IUPsyS – for Argentina. Likewise, Dr. Mustaca is a member of several regional scientific societies, such as the Interamerican Society of Psychology (since 1992). On the other hand, she has also participated in the editorial board of various scientific journals in the area at local and regional level. In this way, Dr. Mustaca's activity has promoted and contributed globally to the integration of local researchers in the discipline with their Latin American specialist peers.

José Celestino Bruno Mutis y Bosio was born into the large family of Julian Mutis (1700–1775), bookseller by profession, and Gregoria Bosio (1705–1774). At the time of his birth, Cadiz was an important port of departure and arrival of ships traveling to the New World, so it is not surprising that José Celestino thought of overseas as a personal destination (De Hoyos Sainz, 1949).

After completing his studies in grammar and philosophy at the Jesuit College in Cadiz (1749), during which he already showed interest in the natural sciences, Mutis entered the Royal College of Surgery in Cadiz. However, without a clear explanation, he traveled to Seville in October 1750 to study philosophy and medicine. In 1753 he graduated with a Bachelor of Philosophy and shortly after as a Bachelor of Medicine. During this period of studies, he became interested in botany, which he combined with his studies in philosophy and medicine. Having practiced medicine in his hometown between 1753 and 1757, he traveled to Madrid, where he obtained the title of doctor-surgeon. During this period, Mutis studied and embraced the classificatory system of Carl von Linnaeus (1707–1778), which competed with the system accepted in Spain by the Frenchman Joseph Pitton de Tournefort (1656–1708). Linnaeus system became Mutis' working guide in America and was the basis of a long relationship with the famous Swedish naturalist (De Hoyos Sainz, 1949).

After obtaining his degree, Mutis remained in Madrid, where he taught anatomy as a temporary substitute. In September 1760, he traveled to America as a personal physician to the Viceroy-elect Pedro Messía de la Cerda (1700–1783). They arrived in Santa Fe de Bogotá on February 24, 1761, where he began to combine his work as a physician with his interest in botany and other sciences (De Hoyos Sainz, 1949).

The Bourbon reforms during the eighteenth century sought to modernize the administrative and social functioning of the Spanish colonies in America since they were considered out of control and unproductive for the Crown. Apart from institutional (e.g., creation of new administrative institutions), fiscal (e.g., increasing taxes and the tax base), and moral (e.g., ensuring religious control of daily life) measures, other social reforms took place in the second half of the eighteenth century. Among them, an increase in the State's participation in the population's health, including the distribution of water, the sanitation of spaces and the cleaning of cities, the displacement of cemeteries, different management of the sick, and the general adequacy of hospitals. Mutis assumed hygienist tasks, formulating a public hygiene policy in the viceroyalty, advising governors to resolve public health crises, enlightening the public in this matter, and performing practical tasks in the control of several diseases, including the primary epidemic disease of the time: smallpox. In the 1782 epidemic, Mutis played a central role as supervisor of an inoculation program and author of a set of recommendations for its correct application (Alzate, 1999).

The reforms also provided an opportunity for the Enlightenment of the colonies, leading to science development and changes in education and society's relationship with knowledge. In this context, Mutis and many others developed his scientific interests, always linked to the value of science as something useful for the Crown. He was a naturalist in a broad sense. He had sufficient knowledge of mathematics to offer a course on the subject in 1762 at the Colegio Mayor de Nuestra Señora del Rosario. He considered mathematics as the foundation of science and technology and promoted its teaching in all educational

contexts. He is credited with introducing Copernican cosmology and Newtonian physics in America; he published writings and gave lessons by invitation at the Colegio Máximo de la Compañía de Jesús in Santafé. This aroused the indignation of the Dominican fathers, who were against the ideas of Copernicus and considered Mutis' actions as part of a movement that threatened their privileges to grant degrees after the expulsion of the Jesuits in 1767; they initiated a process against him before the Inquisition, which prospered in favor of Mutis (De Hoyos Sainz, 1949).

Just 2 years earlier, in 1772, he had been ordained a priest, which, apart from satisfying his religious convictions, offered him the social status, security, and independence to pursue his interests and influence in the New Granada society. It was not unusual at the time for scientists to have a profession from which to survive and devote their energies and efforts to their true vocation in the study of nature. Thus, Mutis was a philosopher, a physician, a priest, and a naturalist, in a broad sense.

Mutis' contributions to the knowledge of botany are widely recognized and have constituted the central aspect of his identity as a scientist. Inspired by his scientific exchange with Carl von Linnæus, he carried out a systematic work of collection and illustration of the flora of the New Kingdom of Granada. He repeatedly proposed to the Crown and directed, from its foundation until his death, the Royal Botanical Expedition of the New Kingdom of Granada (1783–1816), which collected, documented, and organized some 20,000 samples of plants and 7000 animals. Among the justifications put forward by Mutis in his request to the Crown for the approval and financing of the Botanical Expedition, the idea of public utility (read "for the Kingdom") plays a central role and responds perfectly to the sense of the Bourbon reforms. His botanical discoveries include the tea of Bogota, the herb guaco, ipecacuanha, and especially multiple species of cinchona or quinine. His great work, the Flora of the New Kingdom of Granada, lasted for a quarter of a century.

Within the framework of the Botanical Expedition, the Astronomical Observatory was built, which Mutis was to commission with “Francisco José de Caldas” (1778–1816); in addition to the latter, he also hired a series of collaborators, including drafters, assistants, and naturalists of diverse specialties. Among them were Eloy Valenzuela (1756–1834), Pablo Antonio García del Campo (1744–1814), Pedro Caballero (1732–1796), Pedro Fermín de Vargas (1762–1811), Fray Diego García (1745–1794), Salvador Rizo (1760–1816), Francisco Javier Matiz (1774–1851), Jorge Tadeo Lozano (1771–1816), Francisco Antonio Zea (1766–1822), Sinfonso Mutis (1773–1822), Francisco Javier Zabaraín, José Cándamo, José María Cabal (1767–1816), Enrique Umaña (1771–1854), and others. The pictorial work of the Botanical Expedition has been awe-inspiring. That aspect of the Expedition most clearly demonstrated its value to the representatives of the empire, especially considering the slow pace of the written works. While his team produced some 500 detailed descriptions of plants, the team of draftsmen produced some 6700 illustrations. Images were central to colonial science’s observational and representational functions, and in this, the Botanical Expedition was unparalleled. In addition, the images served as a currency of exchange for funding, books, and as a reference for epistolary exchange with prominent naturalists, mainly in Europe (Bleichmar, 2009). The illustrated work of the Botanical Expedition is preserved in the Royal Botanical Garden of Madrid and other institutions, where it was sent in 104 crates during the attempt of Spanish pacification in the period of Independence in 1817.

Being a physician by profession, Mutis had interests in public health (as already mentioned) and physiology, an area in which he conducted a series of experiments on the “irritability” and “sensitivity” of animal tissues, using three dogs and a frog (Mutis, 1760). The strategy was to verify the tissue response and the manifest pain, produced by mechanical stimulation or by the spirit of vitriol (sulfuric acid), in the animal’s internal organs, the brain, and the extremities.

His purpose was to verify the doctrines of Albrecht von Haller (1708–1777), considered the father of modern physiology, who had put forward the differentiation between irritability and sensibility as immanent forces, disputing the doctrine of animal spirits as the source of movement and action.

A little-known aspect of José Celestino Mutis’ naturalistic work is his interest in ants. Between 1777 and 1783, Mutis was commissioned by the viceroy to manage the gold, silver, and copper mine at Cerro El Sapo in Tolima. Like a previous venture supervising the Montuosa Baja mine in Santander in 1766, this venture proved unproductive, despite his efforts to modernize the extraction technique. There Mutis devoted all the time he could to naturalistic observation and described 420 species of plants, more than 80 species of animals, and 24 species of ants. Apart from his records, he made many observations on their natural history (Hernández de Alba, 1983a, 1983b) and of particular interest to the behavioral sciences (and naturally to myrmecology), for which he is just beginning to be recognized. Carl von Linnaeus hinted at Mutis’ interest in studying ants. It was taken with such seriousness that many papers resulted from this work, totaling two volumes, which he sent to Linnaeus and which were unfortunately lost. However, the extraordinary documentary recovery effort of Guillermo Hernández de Alba has allowed experts to access a part of the memories of his dedicated work on ants. It includes valuable and novel behavioral observations of interest to zoologists and animal behavior studies (Fernández & Wilson, 2008; Wilson & Gómez Durán, 2010). In addition to his observations of ants, he also reported observations on termites, bees, wasps, beetles, bedbugs, crickets, flies, butterflies, and moths and promoted zoological records in the Botanical Expedition, especially by Fray Diego García, Jorge Tadeo Lozano, and Francisco José de Caldas (Amat-García & Agudelo-Zamora, 2020).

Mutis studied nature, making important discoveries, as is increasingly suggested by studies of his work available in the royal archives. He is increasingly better recognized as one of the most influential scientists of the eighteenth century and

generally of the colonial period in the Americas (see Wilson & Gómez Durán, 2010; Wulff, 2016).

José Celestino Mutis is known primarily as a botanist, the creator and director of the Royal Botanical Expedition, which was perhaps the most significant scientific enterprise in Spanish-dependent colonial America. He has been the subject of study by historians of science in recent decades for several reasons. First, he received little recognition for his work in Spain until well into the twentieth century, despite being considered the most important scientist during the colony in his adopted country. Second, his stature as a scientist was acknowledged by other universal naturalists and scientists such as Carl von Linnæus, Alexander von Humboldt (1769–1859), Aimé Bonpland (1773–1858), Luis Née (1735–1807), Antonio José de Cavanilles (1745–1804), Carl Peter Thunberg (1743–1828), Pehr Jonas Bergius (1730–1790), Jacques Julien Houtou de La Billardière (1755–1834), and many others who in their epistolary and personal exchange with Mutis gave an account of it (De Hoyos Sainz, 1949; Hernández de Alba, 1949). The historical study of these figures has made the figure of Mutis more than evident and inalienable. For example, it is well known that Humboldt and Bonpland's visit to Santafé in 1801 was mainly motivated by meeting Mutis, whom they considered by far the most relevant naturalist in America (Von Hagen, 1946/2008; Wulff, 2016, pp. 77–78). Third, his largely unpublished work has been “rediscovered” in the twentieth century thanks to a search project in historical archives and the Royal Botanical Garden of Madrid, where thousands of the Botanical Expedition's documents and plates rest. Their value only grows with the dramatic change in flora and fauna of the America that Mutis explored. Finally, the growing access to archives worldwide has made it possible to identify previously ignored relationships and connections that clarify the value of his work and that of other Spanish and Creole scientists in colonial America.

Mutis died in Santafé de Bogotá, where he lived and worked for almost half a century. His collaborators continued his work for a time, but this work was interrupted by the independence

movement in America. They became the prominent leaders of the liberation rebellion in the colonies of New Granada after the death of the master. Many of them were executed or exiled during the period of reconquest in 1816. However, in all cases, their commitment to the new nation and freedom has been attributed to the formative value of the Enlightenment, of which José Celestino Mutis is considered its most vivid representative in the New Granada colony.

Abraham Nadelsticher, better known by his nickname “Bumy,” studied Social Psychology at the Universidad Autónoma Metropolitana-Iztapalapa (Autonomous Metropolitan University-Iztapalapa) (UAM-I), 1970–1974, being part of the first generation at the University. His thesis was the first to be registered at the UAM, with the title “Cooperation and competition for sex and communication with the prisoner’s dilemma game” (Nadelsticher, 1978). He was a nature researcher in such a way that during the last semesters of his career, he ended up taking the professor role of the most advanced topics since there was no one with the knowledge of the subject available for classes and giving classes to his own classmates.

He studied a postgraduate degree in Social Psychology at the Universidad Nacional Autónoma de México (National Autonomous

University of Mexico) (UNAM, 1974–1976), and while studying, he was invited to participate in a well-known researcher team including Rolando Díaz Loving (born 1954) and Susan Pick (born 1952). He started giving several seminars and conferences at the UNAM. He did not complete the postgraduate degree but got immersed into research.

At the same time, he decided to study Physics (because he was an Albert Einstein passionate) and Philosophy while in the UNAM and was invited to seminars on these topics as well. He studied chess participating in many international competitions, where he traveled to Japan representing Mexico’s team in global tournaments. He also studied magic and was fascinated with this topic.

He worked at the Instituto Nacional de Ciencias Penales (National Institute of Criminal Sciences) (INACIPE, 1976–1985) as a researcher, giving seminars and courses to postgraduate students (Del Pont & Nadelsticher, 1981; Cosacov et al., 1983; Nadelsticher, 1983; Gorenc & Nadelsticher, 1985).

He was a professor in Psychology and Statistics at the Universidad Iberoamericana (Iberoamerican University) (IBERO, 1974–1980) (Matus, 2020) and UAM (1974–1990) (Nadelsticher, 1984; Nadelsticher, 1985; Díaz-Loving et al., 1986), his alma mater.

His first job related to Marketing Research was when he formed part of Publicidad Ferrer

(1984–1986). After this experience, he decided to embrace Marketing Research for the rest of his life, always complementing with many other topics (Judaism, Cabala, Astronomy, etc.).

He was the founder of three Marketing Research companies in México, Mexican Association of Market Intelligence Agencies (AMAI 1992), all of them currently positioned among the top 15 (AMAI Industry Census 2019–2020): (1) marketing group, originally Newell-Nadelsticher, its first market research company together with Juan Newell (1986–1988), (2) Pearson, together with Manuel Barberena (1988–1998) (Nadelsticher, 1997), and (3) BRAIN, with Laura Ruvalcaba (1998 up to date) (Pacurucu et al., 1994), current CEO, and his wife at that time – a Mexican Marketing Research Agency with Latin American scope (1998–2001).

He was founder member of the Asociación Mexicana de Agencias de Inteligencia de Mercado (Mexican Association of Market Intelligence Agencies) (AMAI) and second president of this organization. He was recently named a member of the Hall of Fame of the AMAI. He was representative of the European Society for Opinion and Marketing Research (ESOMAR) in Mexico.

He gave seminars and shared his knowledge through ESOMAR and AMAI to Mexico, Latin America, and Europe.

As he did in many other fields, Marketing Research was not the exception, and he gave many conferences and seminars worldwide. We must summarize his contribution in at least two areas: Social Psychology and Marketing Research Society (in Mexico mainly but also recognized in Europe through ESOMAR).

He was passionate about methods for research and statistics and its application in Psychology. His leadership involved alumni from different institutes, and many were persuaded to dedicate their professional studies in Psychology, thanks to him. He was thesis counselor for many of his students. He was an entrepreneur leadership and specialized in Marketing Research methodologies (Matus, 2019).

He introduced in Mexico many worldwide methodologies such as conjoint analysis by

attending seminars with V. Seenu Srinivasan (1944) as well as DQA (discriminant quadrant analysis); he was emeritus professor in 1969 at the Stanford Graduate School of Business, Stanford University (one of the most important figures in conjoint).

One of his most valuable strengths was about learning and understanding (as autodidact) which allowed him to have a clear vision on how to incorporate formal statistical methods into consumer behavior understanding. Formalizing the researcher “common sense” and making it easy to understand had a strong impact on everyone that work with him.

Mexico · Psychiatry · Mental health

Juan Nepomuceno Navarro y Santamaría was the son of the lawyer and liberal politician José María Navarro and Guadalupe Sáenz de Santamaría. He lost her mother at an early age.

As a student he was an outstanding pupil at all stages of his academic training. His primary instruction took place in Morelia. When the time for his high school education came, he entered the Colegio Seminario, where he first studied Latinidad and afterward philosophy.

He began with the minor courses, also known as humanities (or grammarians), where he learned to read and translate Latin. Around the age of 11, in 1834, Navarro completed Castilian grammar. He was presented in public, like five other children, and since then he has attracted attention for his intellectual capacity (Rivas 1835, pp. 28–29). In 1835 he also concluded the course in Latin etymology in an outstanding way.

Between 1836 and 1837, he continued with the medium and major (rhetorical) subjects under the guidance of Clemente de Jesús Munguía

(1810–1868). For philosophy, Pelagio Antonio de Labastida y Dávalos (1816–1891) was his professor for 3 years. (AHFM-UNAM, ff. 4–6).

By 1841 he was already in Mexico City taking botany lessons in the garden in charge of Miguel Bustamante and French with Professor Claudio Gen at the Colegio Nacional de Minería (National College of Mining), essential subjects for those interested in obtaining a degree in Medicine, to which he registered on November 9 of the same year. At the end of the first school year (1841–1842), he had an excellent performance throughout the course until the final exam in 1847. Between January 25 and 26, 1847, his dissertation examination took place, obtaining the grade unanimously.

During that time, he was part of the Academia de San Juan de Letrán (San Juan de Letran Academy), founded in 1836 by Guillermo Prieto Pradillo (1818–1897), and others, one of whose purpose was to create a purely Mexican literature, with its own character, and this is confirmed in the publications of the same academy, where Navarro made known his poetic and historical production, descriptions of customs, literary criticism, short novel, and translation.

When he graduated, in early 1847, Mexico was facing a war with the United States. The young doctor Navarro took part in the defense of the nation as a volunteer in the “National Guards.” On August 20, he was captured during the defense of the Convento de Churubusco (Convent of Churubusco), where the attacks of the forces of the American general David E. Twiggs (1790–1862) were resisting. During his captivity he served as a physician. Under these circumstances, Navarro met soldiers such as Ulysses S. Grant (1822–1885), the engineer Robert E. Lee (1807–1870), George B. McClellan (1825–1885), and some other officers like him, whose friendship would continue many years later, during his long residence in the United States (Torres 1894–1896, 1915). After the North American intervention, he was elected deputy to the general congress for the biennium 1848–1849 and re-elected for that of 1850–1851.

With regard to the craft union, he participated in the creation of the Segunda Academia de

Medicina (Second Academy of Medicine) (1851), the most direct antecedent of the current Academia Nacional de Medicina de México (National Academy of Medicine of Mexico); of which he was a partner and where, by the way, he aspired to occupy the position of secretary.

In the second semester of 1850, he competed to obtain the position of deputy of the internal clinic chair, whose ownership was in the hands of Dr. Miguel Francisco Jiménez (1813–1876). That same year, and also by opposition, he became deputy of the external clinic. He earned the ownership of the first in 1852 and of the second in 1857. In 1851 he was appointed Secretary of the Escuela de Medicina de la ciudad de México (School of Medicine of Mexico City), replacing Dr. Rafael Lucio y Nájera (1819–1886).

His work on this campus was decisive; since coinciding that he was also serving as a representative, he supported the opinion that awarded the former convent of San Hipólito property to the Medical School, where he moved that same year, occupying the same place where the oldest hospital for the mentally ill of the American Continent was located (f. 1566–1567).

In his capacity as internal clinic professor, he also had the responsibility of being the director of the aforementioned asylum (1851–1853), which at that time was in lamentable conditions. In the first place, Navarro had it scrupulously cleaned, a circumstance that at the same time suited the image of the school itself; but, in addition, he improved the feeding of the sick and ordered the prohibition of containment instruments that could physically harm the inmates. He placed particular emphasis on the clinical and diagnostic precepts formulated by Adam Raciborski (1809–1871), a French physician of Polish origin. It is important to note that he was the first medically trained Director of a Hospital for the Insane, worth the term, very common at that time. Previously, and after him, it was common for these centers to be directed by an “administrator” and the doctor in charge occupied a secondary level of importance. On the other hand, there is no precedent in Mexico, nor in Latin America, where the students of a School of Medicine had such close contact with mental illnesses and patients with these clinical

conditions; set of circumstances, all of them, that made us propose such events as the starting point of Mexican psychiatry (Campos-Farfán 2006, 2007).

In August 1853 the school was evicted from the building, during the so-called second dictatorship of Antonio López de Santa-Anna (1794–1876) to enable it as a cavalry barracks. Professors and authorities, in a new and definitive attack, managed to raise a little more than 50,000 pesos, according to Flores (1888, p. 107), with which it was possible to buy the old building of the Inquisition, which by then belonged to the Seminario Conciliar de México (Conciliar Seminary of Mexico).

On the instructions of President Benito Juárez (1806–1872), in 1861, and with Dr. Gabino F. Bustamante (1816–1871) as his assistant, Navarro designed the Hospital de Maternidad e Infancia (Maternity and Childhood Hospital). However, he remained interested in the care of the mentally ill, because in the same year, in the company of the Italian doctor Luis Garrone, he paid a visit to the Hospitals of San Hipólito (for men) and El Divino Salvador, or La Canoa (for women), in order to report on “their current state, their funds, their regime and other essential circumstances, proposing the improvements that can be introduced and that science, humanity and civilization demand” (Zarco 1991, p. 353). This inspection paid off, and from then on, the mental healthcare landscape in Mexico changed dramatically. They found the Hospital de San Hipólito very “messy,” as well as the Hospital Real de San Pedro (Royal Hospital of San Pedro), also called the Holy Trinity (which at this time only cared for “insane” priests). Immediately, by Navarro’s indications, Dr. Miguel Alvarado (1820–1896) was appointed as the director of the “hospitals for lunatics,” giving himself the task of reforming such establishments, which he did successfully. Alvarado was the one who suggested that the ancient Hospital de La Santísima be closed, to find that it gave an “extremely poor care to its patients,” same who were transferred to San Hipólito the following year (1862).

Navarro and Garrone were also commissioned so that, in cooperation with the French architect

Enrique Griffon, they would assess the convenience of establishing both hospitals in the former Convento del Carmen (Convent of Carmen), in San Angel, excluding the temple that would continue to serve the Catholic cult. A journalistic note reported that “The San Angel City Council and the main neighbors support this government project, and some well-off people have offered to help with donations to improve the hospitals for lunatics” (The Monitor, p. 2). The project did not materialize, and the hospitals continued until 1910, when their patients were concentrated in the new National Psychiatric Hospital, known as “La Castañeda,” which was inaugurated on September 1, 1910, by the President of Mexico.

As the years passed, Juan N. Navarro’s life became more oriented toward diplomacy. In 1863 he was appointed consul of Mexico in New York, where he remained until his death. On October 24, 1966, the Children’s Psychiatric Hospital “Dr. Juan N. Navarro” opened its doors as the first of its kind in Latin America, in recognition of his work.

Miguelina Nazario Vega was born at the beginning of the twentieth century at a small town in the southern coast of Puerto Rico. Her father died while she still was a child and she grew up with her mother, Cruz Vega, and an older sister. She studied at the public schools of Guánica and Yauco, where she was known by her insatiable quest for knowledge, her responsibility, and her desire to help others (Roca de Torres, 2006). Hernández is the last name of her second husband, Martín, name she used most of her professional life. At the beginning of her professional life, she used the last name of her first husband, Miguel Ángel Lopategui, and signed Miguelina N. de Lopategui.

After graduating from Yauco High School, she enrolled at the Polytechnic Institute of Puerto

Rico (today Interamerican University of Puerto Rico) in San Germán, where she graduated in 1937 with bachelor's degree in arts (BA) with a concentration in English. With a degree in English, she immediately started teaching this subject in the public schools of Puerto Rico in both the primary and secondary level. Moreover, she started to take courses in the methodology of teaching at the University of Puerto Rico (UPR). Due to her knowledge, interest, and responsibility, she is soon promoted to Principal and School Director.

When Miguelina Nazario de Hernández realized that in order for children to learn English, teachers had to train themselves in the techniques to teach English as a second language, she decided to study a master's degree in this area. In 1944, she moved to New York City, NY, in the United States of America and enrolled in a graduate program in this area at Columbia University, what we can consider a very courageous move for a Puerto Rican girl in this era.

Although she finished her master's degree (MA) in 1946, she was not happy with her academic preparation because she realized that in order for children to learn, their cognitive abilities and psychological adjustment must be evaluated. She transferred to the Educational Psychology Graduate Program at Teacher's College of Columbia University and initiated her doctoral studies. She was unable to finish her doctoral studies at this time because she was offered a position as professor at UPR-RP to contribute to the development of Puerto Rican future teachers. This task was so important to Miguelina Nazario de Hernández that she immediately accepted the challenge.

After a year as a college professor, she accepted a position as psychologist at the Evaluation and Research Division of the government Department of Public Instruction (1951–1954). This Division, led by Pablo Roca de León, was responsible for the development of the first translations and adaptations of intelligence, general abilities, and achievement tests for the Puerto Rican children population. Miguelina Nazario participated actively in the adaptations of the WISC and Stanford-Binet (Roca, 1951 & 1953).

She directed the standardization of Draw a Person Test for children between 5 and 10 years of age ($N = 1322$, 1954). For a couple of years, she also worked as a psychologist at Veteran's Administration Office.

This early experience in developing tests and her previous training as teacher, added to her clinical experiences as psychologist at the Veteran's Administration, led Miguelina Nazario de Hernández to Purdue University at Indiana, to pursue doctoral studies in School Psychology. She graduated in 1957, becoming the first psychologist with a PhD in School Psychology in Puerto Rico (Roca de Torres, 1993–1994; Sumaza Laborde, 2006). Her doctoral dissertation was *Needs and problems of Puerto Rican high school students related to N variables (1957)*. She moved to Chicago for a year to work as a school psychologist in the Chicago Public Education System. Finally, her academic interests – English, Psychology, and Education – were united in her direct work with Puerto Rican children whose parents had migrated to Chicago, Illinois.

In 1958, with her doctorate and experience in the Chicago schools in hand, she returned to Puerto Rico, as psychologist-researcher at the Evaluation and Research Division of the Department of Public Instruction of the Commonwealth of Puerto Rico, where she worked until 1966. In her last 4 years at this office, she was promoted to Director. During these years she devoted her time to a study about Puerto Rican adolescents and developed instruments to survey their needs and problems. She held four patents at the Catalogue Office of Copyrights of the Library of Congress for *Inventario Juvenil, Grados 9–12 (Juvenile Inventory, Grades 9–12)*. She published articles about her research on local and US journals. She became interested in educational research in Puerto Rico, particularly the satisfactions and frustrations of teachers. In 1961, she received a Fulbright Scholarship and went to *Universidad Nacional Simón Bolívar* (Simón Bolívar National University) in Perú as a visiting professor.

In 1966, Dr. Miguelina Nazario de Hernández is offered a teaching position at Interamerican University-Metro as a professor of Psychology. She not only impacts the psychology students

and the curricula offered; she becomes Director of the Psychology Program, Coordinator of Graduate Studies, and, eventually, Dean of the Faculty of Behavior Sciences. She is one of the main organizers of Inter-Metro graduate offerings in School, Counseling and Personnel Psychology. She remains at Inter-Metro around 5 years (1966–1971), but then she returns to Chicago to her roots in School Psychology.

Dr. Miguelina Nazario de Hernández is contracted by the Department of Education of Chicago to be the Director of its Bilingual and Bicultural Psychological Services Office. For 6 years, until 1977 she is responsible of offering adequate psychological services for the bilingual population of Chicago, especially for those students of Puerto Rican roots. During these years she travels intensely in the United States and Canada offering lectures and workshops about the psychological evaluation of minority students and their educational needs. She works in important committees, both state and federal, about these important issues. Most of all, she defends the rights of Puerto Rican children to receive an adequate, valid, and just evaluation and an acceptable educational program just like their North American peers.

In 1977 she returned to Puerto Rico and opened a private practice office with her husband, Martín Hernández, to evaluate and treat Puerto Rican children with learning problems. She also worked as Consultant on Education to the School of Dentistry, UPR-Medical Campus, and to the Department of Public Instruction of the Commonwealth of Puerto Rico. She started to write a book about School Psychology in Puerto Rico. The conclusion of this book was interrupted by her illness and eventual death in 1989. She gave me a couple of chapters of her unfinished manuscript, and I used some of the information she provided, crediting her, to publish an article in *Revista Puertorriqueña de Psicología* and a chapter in a book (Roca de Torres, 1991, 2000).

Dr. Miguelina Nazario de Hernández left a great legacy. We will always remember her quest for adequate, valid, and fair psychological evaluations in bilingual and multicultural contexts and her insistence on developing the maximum

potential of our children. We will always remember that she taught us that all children are able to learn; it is just that as teachers and psychologists, we must find the specific way to evaluate and teach each child according to his or her particular way of learning.

Mathilde Neder started her undergraduate studies in Pedagogy at the Pontificia Universidade Católica (PUC) (Pontifical Catholic University) of Campinas, in 1943. In the following year, she transferred her studies to the Universidade de São Paulo (USP) (University of São Paulo), where she graduated in 1946. She completed both Educational Psychology (1945–1947) and Clinical Psychology (1955–1956) specializations at USP, in addition to a Clinical Psychology (1954–1956) specialization at the PUC of São Paulo. At USP, she also earned her Master's (1951–1952) and Doctorate (1967–1972) degrees in Clinical Psychology. Between 1991 and 1997, she carried out

post-doctoral studies in Family Psychotherapy in the United States, Mexico, and Italy.

Between 1952 and 1954, she began collaborating with the Orthopedic and Traumatological Clinic at the Hospital das Clínicas da USP (Clinical Hospital of USP), providing psychological support for children who underwent spine surgery, to promote treatment adherence. To this end, she also worked with the children's families and medical staff. This event marked the beginning of hospital-based psychology in Brazil. In 1957, she started working with patients who suffered from incapacitating physical disabilities at USP's newly created Instituto Nacional de Reabilitação (National Institute of Rehabilitation). To adapt to the needs imposed by the hospital reality, she developed brief psychotherapeutic treatments based on psychoanalysis. At the time, brief psychotherapy was not a common practice in Brazil, and there was no information about it. Mathilde only became aware of the "brief psychotherapy" designation in the late 1960s, as a result of attending a course offered by the Argentine psychoanalyst Mauricio Knobel (1922–2008). Only then did Mathilde learn the similarities between her work and that developed in the field of brief psychotherapy in other countries, such as Argentina, the United States, and England.

Mathilde began to publish her work on hospital-based psychology in the late 1950s (e.g., Neder, 1959, 1962). In 1967, her work on rehabilitation was reported in her paper published by the United Nations (UN) (Neder, 1967). In 1974, she began directing the newly created Serviço de Psicologia da Divisão de Reabilitação Profissional de Vergueiro (Psychology Service of the Vergueiro Professional Rehabilitation Division) at the Hospital das Clínicas of USP. In 1982, she assumed the coordination of the psychological services at the Instituto Central (Central Institute) of the Hospital das Clínicas of USP, organizing and directing the Psychology Unit. In 1987, she took on the general coordination of the psychologists' activities at the same hospital. In this role, she presided, between 1991 and 1998, the Board of Directors and the Editorial Board of the scientific journal *Revista de*

Psicologia Hospitalar (Journal of Hospital Psychology). Created by her own initiative, it was the first publication on the subject matter in the country. She was head of the last Psychology Department of the Faculdade de Filosofia, Ciências e Letras São Bento (São Bento's College of Philosophy, Science and Language) – which gave rise to the Faculdade de Psicologia (Psychology College) of the PUC of São Paulo. She played an important role in the creation of the Programa de Estudos Pós-Graduados em Psicologia Clínica (Postgraduate Studies Program in Clinical Psychology) at this university, which started its activities in 1976. In this Program, she created and coordinated the Núcleo de Psicossomática e Terapia Familiar (Center for Psychosomatics and Family Therapy). She promoted, in 1982, the first Encontro Nacional de Terapia Familiar (National Meeting of Family Therapy), which would later be held in other cities throughout the country. As a result of this meeting, the Associação Paulista and the Associação Brasileira de Terapia Familiar (São Paulo and Brazilian Associations for Family Therapy) were created. At the PUC of São Paulo, also in the early 1980s, she founded the specialization course in "Psicologia da Saúde: Psicologia Hospitalar" ("Health Psychology: Hospital Psychology").

She contributed substantially to the growth and consolidation of psychology as a profession, having a prominent role in the Sociedade de Psicologia de São Paulo (Psychological Society of São Paulo), starting in 1958, regarding the discussion and formulation of the project that would result in Law nbr. 4119 of 1962, which regulated the profession in Brazil. Influenced by the proposals made by members of the Sociedade de Psicologia de São Paulo in the context of this discussion, the psychology professional in Brazil is today called "psicólogo" (from the French word *psychologue*), a word that was chosen in opposition to the designation privileged by the Brazilian government: "psicologista" (from the English word *psychologist*). As president of the Sociedade de Psicologia de São Paulo (1969–1970), she worked for the creation of the Sindicato dos Psicólogos de São Paulo (Psychologists' Union of São Paulo) – the first of its kind in the country.

Starting in 1973, she took part on the first two administrations of the Conselho Federal de Psicologia (Federal Council of Psychology). In 1975, she was elected president of the Associação Brasileira de Psicólogos (Brazilian Psychologists' Association), which under her administration was renamed Associação Brasileira de Psicologia (Brazilian Psychological Association). In 1989, she created the Centro de Estudos e Pesquisa em Psicologia Hospitalar (CEPPHO) (Center for Studies and Research in Hospital Psychology). Between 1995 and 1997, she became a representative of the Sociedade Interamericana de Psicologia (Inter-American Psychological Society) in Brazil. In the same Society, she coordinated the study group in Clinical Psychology. She supervised 31 Master's dissertations and 19 Doctoral theses. Author of dozens of academic publications, she has always valued sharing her knowledge in numerous lectures and conferences, both within Brazil and abroad. She is a member of the Academia Paulista de Psicologia (São Paulo Academy of Psychology), occupying chair 14 by Anibal Cipriano da Silveira Santos (1887–1953).

Nieto Caballero, Agustín

Born in *Bogotá (Colombia)*, August 17, 1889

Died in *Bogotá (Colombia)*, December 3, 1975

Telmo Eduardo Peña-Correal
Pontificia Universidad Javeriana, Bogotá,
Colombia

Keywords

Colombia · Education · Cognitive measurement

The main concern of Agustín Nieto Caballero during his lifetime was education, based on his profound conviction that Colombia's development as a nation depended basically on changing the educational practices that were dominant in the country at that time.

Since the 1886 Constitution and the 1887 Concordat between Colombia and the Vatican, public education was under the control of the Catholic Church. The usual educational practices were characterized by a teacher-centered pedagogy, mainly verbalistic and authoritarian, where teaching was equivalent to instructing and learning was equivalent to memorizing (Cubillos-Bernal, 2007). In this context, Nieto Caballero, based on the ideas of psychologists such as Jean Piaget (1896–1980), Édouard Claparède (1873–1940), Alfred Binet (1857–1911), and William James (1842–1910) and pedagogues such as Maria Montessori (1870–1952), Ovide Decroly (1871–1932), Adolphe Ferriere (1879–1960), and John Dewey (1859–1952), and a particular adaptation of their proposals to the Colombian context, became not only a pioneer of the transformation of education in Colombia, but one of the main influencers through the creation of

several educational institutions and the development of several national educational policies with which he contributed to the transformation of elementary, secondary, and university education.

Agustín Nieto Caballero was the oldest son of three (a brother, Luis Eduardo, and a sister Paulina) of a family conformed by Agustín Nieto and Paulina Caballero. When he was 5 years old, his mother died; his father also died only 4 years later. Agustín, his brother, and his sister were placed under the tutelage of their uncles Isidro Nieto and Lucas Caballero Barrera (1869–1942). Agustín's elementary education took place in several private schools of Bogotá, such as the Escuela de los Hermanos Cristianos (Christian Brothers School), the Colegio Americano (American School), the Colegio Araujo y Ramírez (Araujo and Ramírez School), and the Liceo Mercantil (Mercantile Lyceum). Nieto's biographers say (Cuesta et al., 2017) that he was not a good student, because he was a restless, undisciplined boy and that he had continuous problems with his teachers; this was the reason for his frequent changes of school.

When Nieto Caballero was 15 years old (1904), his uncles sent him, his brother, and his sister to continue the secondary education in Suisse, London, and New York. In the last city, he finished high school in the Jonker's School in 1910 and then went to the Teachers College of Columbia University where his main interests were Biology and Psychology. However, shortly after, Nieto returned to Europe (France) where he studied at the same time Law and Pedagogy in the Law School at the Sorbonne of Paris. He graduated as Bachelor of Law in 1912, but his main interest became Education. Because of that, he got in touch with the Institución Libre de Enseñanza (ILE) (Free Institution of Teaching) in Spain and its founders Francisco Giner de los Rios (1839–1915) and Rafael Altamira (1866–1951). According to Cuesta, Galvis, and Romero (2017), they provided him with a new way of seeing education.

Nieto Caballero returned to Colombia in 1913, being 25 years old, with the idea of reforming Colombian education, by creating an experimental public school inspired in the model of the

Active School, but due to bureaucratic, ideological, religious, and political barriers, and following the suggestion of the President of Colombia, Carlos E. Restrepo (1867–1937), he founded in 1914 a private school, named Gimnasio Moderno (Modern Gymnasium), with the economic support of several businessmen such as José María Samper Brush, Ricardo Lleras Codazzi (1869–1941), and Tomás Rueda Vargas (1879–1943). With the initial collaboration of two Spaniard pedagogues, Pablo Vila (1881–1980) and Miguel Fornaguera (1893–1982), Nieto Caballero inaugurated the methodology of the New School inspired in Montessori and Decroly.

In 1916, Agustín Nieto married Adelaida Cano Villegas (1895–1976), daughter of the founder of an influential Colombian newspaper, *El Espectador* (*The Spectator*), Fidel Cano (1854–1919). They had six children and the union lasted until Agustín Nieto's death.

In 1925, Nieto invited Ovide Decroly to Bogotá. This important Belgian educator gave several lectures on his proposal of "Interest Centers" and on assessment tests. In 1935, Nieto was appointed as the National Inspector of Teachers Schools and Elementary Education. During his tenure, Nieto proposed a profound reform to the curriculum and methodologies used in elementary education. This proposal was finally approved in 1935, but it was implemented only in the central region of the country. As a follow-up of his reform ideas, Nieto participated in the foundation of the Escuela Normal Superior (Higher Teacher Training College) (1936), where he became a professor.

In 1938, Nieto Caballero was appointed as Rector of the Universidad Nacional de Colombia (National University of Colombia), being Alfonso López Pumarejo (1886–1959), the President of Colombia (1934–1938). During his tenure, he contacted the Spaniard psychologist Mercedes Rodrigo Bellido who had migrated to Switzerland during the Spanish Civil War and invited her to collaborate in his plan of reform for the National University. Mercedes Rodrigo moved to Bogotá in 1939 with her sister Maria and a young collaborator José María García Madrid and with the support of Nieto Caballero developed a program for the systematic selection of students of the

National University. Later on Mercedes Rodrigo founded the first program of psychology training in the country (Ardila, 2013). Nieto's main purpose as Rector of the National University was clearly stated in his words that are still valid: "We would like that the university was not only a professionals' factory, but also a research laboratory" (From the acceptance speech as Rector of the University).

In 1942, Agustín Nieto was appointed as Ambassador in Chile and between 1943 and 1960 participated as representative of Colombia in several international congresses on education and in international organisms on issues related to education. In the last part of Nieto's life, he was occupied with the organization of his writings.

As Cubillos-Bernal (2007) and Soto-Triana (2014) note, the Colombian education system was under the control of the Catholic Church since the Constitution of 1886. This educational system was guided by a series of moralistic precepts to educate students to have "virtue, responsibility and service as a Christian apostolate" (Soto-Triana, 2014, p. 14).

Agustín Nieto (1989) himself wrote that this type of education lacked life and motivation, because the classrooms only promoted homogeneity, with no space for creativity, dynamism, or any form of life. Moreover, among these pedagogical practices, the physical abuse was legitimized in and out of the classroom. Learning consisted in repeating to memorize and uncritically accepting the authority of the teacher.

In any case, these educational practices assumed that the student was a passive subject who could be shaped according to some precepts imposed by the teacher, the government, and the Church.

The stance of Agustín Nieto Caballero in Europe and the United States allowed him to have contact with functionalist, experimental, differential, and developmental psychology that were the conceptual background of his pedagogical conceptualizations and practices.

Several psychological questions were specifically pertinent for education: How do we obtain

knowledge? How do we learn? What environmental conditions foster the development of learning? Could cognitive abilities and capacities be measured? These questions are answered in several ways, but Piaget, Binet, and Claparède's conceptualizations regarding the development of cognition as adaptation to environment stand out. The development of an intelligence test by Binet is an illustrative example, given that he considered intelligence as the capability of an individual to cope with the problems of everyday life based on experience (Binet, 1922).

These authors contributed with a cognitive developmental theory that implied a radical change in the way of conceiving children and adolescents that was adopted by Nieto Caballero and applied to his pedagogical policies and work.

Belgian pedagogue Ovide Decroly developed the concept of "centers of interest" as a core part of his pedagogical practices based on the idea that learning really takes place when the child interacts with objects and events that are relevant to him. The focus in the meaningful interaction of children with their environment is the basis of the movement called Active or New School. Agustín Nieto Caballero brought and adapted these educational practices to Colombia, first to the Modern Gymnasium and later to other private and public schools.

Nieto Caballero was a pioneer in Colombia in developing a pedagogical proposal based on psychology, but also adapted it to the Colombian political and religious conditions at the beginning of the twentieth century.

Nieto Caballero's beloved child was the Modern Gymnasium; its creation is the beginning of the movement "New School" in Colombia (Cubillos-Bernal, 2007; Cuesta et al., 2017). This movement is an educational model based on the idea that the student is an active participant and the task of the school is to provide him with the possibility of having emotional and cognitive relevant experiences. However, it is also clear that education has a practical goal: "to educate individuals to fulfill the country needs" (Nieto Caballero, 1918).

Obviously, this consideration implied the creation of a physical environment to promote active learning. This was reflected in the architectonic structure of the Gymnasium and the importance that Nieto Caballero gave to school outings to different places in the country as a part of the students' learning process.

This way of conceiving learning implied a radical change of the teachers' work. Nieto was especially concerned with the teachers' education. Some illustrations of this preoccupation were the hiring of Spaniard pedagogues, the sending of several teachers to Europe to be formed in the Active School model, and later the creation of the Escuela Normal Superior [High Teachers' Training College]. As Cubillos-Bernal (2007) states: "Don Agustín had an idea, that we wish was the case today: 'If we don't educate the teacher, if we don't prepare the teacher, education will not change'".

In Rodríguez words (1925, cited by Soto-Triana, 2014, p. 304) the new idea of a good teacher is:

The teacher speaks little. His motto should be: few words, many facts. Presenting, doing, observing, analyzing, manipulating, experimenting, building, collecting. (...) The teacher will make his best efforts not to deny the student freedom, but to give full satisfaction to the children needs of activity and movement (...) The teacher will join the direct observation and the personal investigation of the student to the construction of the study materials.

The teacher is a guide, a model, an enabler who promotes the personal and social construction of reality by the students themselves. He/she is someone who observes and guides the student in the classroom, but who mainly works outside of the classroom by constructing study materials, readings, observations, etc., to create a stimulating environment for the next meeting with his/her students (*Gimnasio Moderno* 1917, cited by Soto-Triana, 2014).

However, considering the Colombian social and political conditions and in order to avoid the conflicts with the conservative government of that time (when the *Gimnasio* was founded) and with the Catholic Church that considered Nieto's secular proposal for education as contrary to their interest, Nieto adapted the model of the New

School. Some of these adaptations were the following: (a) an only male school, because in that moment a co-ed school was under suspicion by the Catholic Church; in fact, Nieto Caballero also founded in 1928 a girls school, the *Gimnasio Femenino* [Feminine Gymnasium] inspired in the same principles of the Modern Gymnasium; (b) a curriculum based on courses in the usual way; and (c) an educational model where the moral and spiritual issues would continue directed by the Catholic Church, whose teachings were considered the essence of being Colombian.

It is surprising the currency of Nieto Caballero's proposals, given the fact that they were implemented more than 100 years ago and that several of the educational practices he criticized are still in effect in many Colombian schools. As Romero, Galvis, and Cuesta (2017) point out: "Even though the ideas proposed by Nieto Caballero are still in effect in the Modern Gymnasium, it is also true that at the national level many of his postulates have been relegated on the paths of time, while the critiques that he made at the beginning of the 20th century persist today, after one hundred years" (p. 178).

Agustín Nieto Caballero was one of the Colombian intellectuals of the twentieth century. His contributions to education and psychology are acknowledged not only in his ideas and his writings but specially in the institutions he founded, directed, and promoted during his lifetime. Those ideas, works, and institutions continue to influence the development of the nation.

Son of Ezequiel Nieto and Maria Cardoso. He received his B.A. and M.A. in Theology from the Universidad Letrán de Roma (Lateran University, Rome) (1959); his B.S. from the Universidad de Coahuila (University of Coahuila) in 1960; his M.D. from Loyola University in Chicago in 1971; his Ph.D. in Psychology from the same university in 1975; and his M.A. in Organizational Development from the Universidad de Monterrey (University of Monterrey) in 1976. He also had graduate studies at The Catholic University of America, Washington, D.C.

He was an active member of the Ecumenical Movement, Rome in 1970. In 1977 he participated in the World Movement for Peace in Mexico. In addition, he was a member of the Sociedad Mexicana de Psicología (Mexican Society of Psychology), the Asociación Humanista de Psicología (Association of Humanistic Psychology), the Asociación Americana de Asesoramiento y Desarrollo (American Association of Counseling and Development), the American Psychological Association.

He also held different managerial positions: Director of Colegio de La Salle in Matamoros, Tamaulipas (1962–1966), and President of the Consejo Nacional de Enseñanza e Investigación en Psicología (CNEIP) (National Council for Teaching and Research in Psychology) (1975–1977).

With respect to teaching, he participated as a professor and researcher in the following

institutions: Professor at the Universidad Iberoamericana, Mexico City (1978–1980), and Researcher at the Interdisciplinary Centro Interdisciplinario de Investigación y Docencia en Educación Técnica, Querétaro (Center for Research and Teaching in Technical Education, Querétaro) (1982–1984). He was a Professor at the Universidad Monterrey (1975–1982), Dean Emeritus since 1982 of the UDEM. He worked as a private consultant since 1984 and as a researcher since 1985 at the University of Monterrey.

Nieto Cardoso considered psychology as a discipline, school field, and professional activity. His global approach was directed to the study of animal and human behavior, to the anatomical bases, and to the physiological and mental processes related to it. As a school discipline, it considers that Psychology is in charge of the study in academic environments, with emphasis on the communication and explanation of the principles and theories of behavior.

For Nieto Cardoso as a science, researchers in psychology collect, quantify, analyze, and interpret data that describe animal and human behavior. As a profession, psychology involves the application of knowledge, skills, and techniques for the solution or prevention of individual or social problems.

He has translated the book *The Skilled Helper* by Gerard Egan (1981), which presents the basic technology for the exercise and training of the professionals of psychological help. It is based on the scientific knowledge in the field of therapeutic psychology and the interpersonal help relationship, besides the implementation of the counselor and the oriented.

In 1982 the second part, *The Expert Counselor's Manual* was published, of which he was also the translator, a material designed to complement the book, and consists of exercises for the student to put into practice the skills of the Model. From Nieto Cardoso's point of view, the student must acquire the cognitive understanding and skills, observe those skills from his teacher, and then be able to practice. The exercises help the student to clarify and experience the helping skills, which prepares him for real practice.

He worked on themes such as death, where he presents various essays, making an analysis from different positions, from the faith that death is the worst of all misfortunes and death the final and agonizing struggle against the extinction of life. At the same time, the incomprehensibility of death, its presumed purpose, has reverently frightened and terrified men and women since the dawn in which the human being awakened to his own consciousness. A spiritual perspective on death and dying does not involve dogmas, creeds, or absolute morals: like the air we breathe, death is inseparable from life.

During his career, he obtained different professional and academic recognitions; some of them were Honorary member of the National Council of Teaching and Research in Psychology (1975), and he obtained the Christian Brothers Scholarship (1968).

Other interests he had were archaeology, swimming, reading, writing, and travel.

Keywords

Mexico · Neuropsychiatry · Mental illness · Psychopharmacology

Dr. Nieto graduated as a doctor from the Universidad Complutense de Madrid (Complutense University of Madrid) in 1929 where he studied “pelagrous psychosis,” and later (from 1929 to 1934) he studied neuropsychiatry in Germany for 5 years at the Deutsche Forschungsanstalt für Psychiatrie (German Institute for Psychiatric Research), (currently the Max-Planck-Institut für Psychiatrie, Max Planck Institute of Psychiatry). Later he

returned to Spain in 1935 to the Instituto Cajal (Cajal Institute) in Madrid and left Spain in 1939 due to the Civil War, to Mexico. In 1940, he immediately joined the Laboratorio de Estudios Médicos y Biológicos (Laboratory of Medical and Biological Studies) of the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM). In this laboratory, now the Instituto de Investigaciones Biomédicas (Institute for Biomedical Research), Nieto began work to found the Departamento de Neurología Experimental y Neuropatología (Department of Experimental Neurology and Neuropathology) to study brain-mind interaction. His first studies focused on alcoholic psychosis, the neuropathology of schizophrenia, and neurocysticercosis, which were his lines of research for many years, in addition to psychopharmacology. The clinical study material is obtained through a job as head of the clinical analysis laboratory in the old Manicomio de La Castañeda (“La Castañeda” Asylum), which later became the current Fray Bernardino Álvarez Hospital. There he develops an immunohistochemical reaction test to detect human cysticercosis that is used up to this day and is known as the Nieto test.

In 1964 he joined the Instituto Nacional de Neurología y Neurocirugía [National Institute of Neurology and Neurosurgery] of the Secretaría de Salud (Ministry of Health), where he was head of the Departamento de Psiquiatría (Department of Psychiatry). In the 1940s and 1950s, Mexican psychiatry was intensely influenced by psychoanalysis. The School of Psychology was in the Facultad de Filosofía y Letras (Faculty of Philosophy and Literature, UNAM) at that time and was directed by Freudian psychoanalysts. At the Facultad de Medicina (Faculty of Medicine) (UNAM), a Departamento de Psicología Médica, Psiquiatría y Salud Mental (Department of Medical Psychology, Psychiatry and Mental Health) was created by doctors Ramón de la Fuente Muñiz and Alfonso Millán Maldonado (1906–1975), both from the first group of disciples by Erich Seligmann Fromm in Mexico. Nieto kept his distance and dedicated himself to the defense of a biological psychiatry, with an orientation based on scientific research. In this context, as one of his students, Dr. José Luis Díaz Gómez

(1943) pointed out, “This happened at a time when the psychodynamic paradigm was prevailing and for which it was erroneously considered that the search for brain correlates of psychoses was not only useless but methodologically absurd. Although the attitude has changed diametrically, it is worth highlighting the role that I have called ‘uncomfortable’ that Nieto played for these and other of his investigations and that he was very healthy in our environment as an enlightened and courteous opposition to the majority, in the face of general skepticism” (Fernández-Guardiola, 1997; Escobar, 2008).

Another experimental line developed in parallel by his group, around the 1950s, was that of psychopharmacology, where its analysis methodology was fundamentally phenomenological and not with the methods of double-blind randomized studies that we see today, but with a great observation expertise that has made important results remaining to this day. He did research on the effect of hallucinogenic mushrooms, psilocybin, and LSD on volunteers, as well as the effects of phenothiazines, MAO inhibitors, lithium, and tricyclics. It should be noted that one of its pharmacological combinations has been one of the products that helped to found an important national pharmaceutical company and that to date this product continues to have a high prescription (Adepsique © psychopharmaceutical).

Another field that Nieto expanded was that of the historical documentation of mental illness. He reviewed the concept of insanity in ancient times, both in the descriptions of doctors and philosophers. He concluded that the notion of mental illness was well established for a long time, and denying that madness is the product of a determined civilization (as claimed by some anti-psychiatrists (Foucault, 2015)). To get there, he relied on modern anthropological studies that have verified the presence of mental disorders in all ethnic groups.

In 1970 Nieto was appointed head of a reference network on psychopharmacology by the World Health Organization.

I was fortunate to have been one of the last medical students to receive the teachings of the psychiatry course taught by Dionisio Nieto at the

Institute of Neurology, and thanks to that, I decided to study this specialty. Nieto guided his neuropsychiatry classes with constant references to the neuropathological structure of the nervous system and the need for better biochemical tracers of these anomalies. As well, he emphasized the importance of obtaining data with the methodological rigor of scientific information.

He was an unforgettable teacher for several generations of Mexican scientists. Among the many outstanding students and later great scientists who were influenced by Nieto, we can name Augusto Fernández Guardiola, Héctor Pérez Rincón (1942), Alfonso Escobar Izquierdo, José Luis Díaz Gómez (1943), Gastón Castellanos (1965), and Alfonso Martín del Campo (1986).

Dr. Nieto’s work in psychology established the study of behavior (scientifically measured) placing the brain as the responsible for human pathological behavior. Thus, he distanced from the prevailing psychoanalysts in Mexico, which used the anecdotal and phenomenological description of their therapeutic experience to explain people’s actions. This is why his school in Mexico, from the use of scientific rigor based on the proposal of hypotheses, follow-up of methods, evidence supported by the use of animal models, and biochemical measurements, laid the foundations for a biological vision, centered on the brain as source of psychopathology, and that remains to this day.

Brazil · Racism · Forensic medicine · Anthropology

Raimundo Nina Rodrigues was born in the interior of the state of Maranhão, at Fazenda Santa Severa, Vargem Grande district. He was the son of Luísa Rosa Nina Rodrigues and Francisco Solano

Rodrigues. On his mother’s side, he was presumably descended from Sephardic Jews from the Iberian Peninsula who came to Brazil under political-religious persecution, according to a family member who reported without further details the oral story transmitted in the family (Corrêa, 2006). His father was a landowning colonel and a plantation master. Raised among seven brothers, it was at the headquarter of Vargem Grande that Nina started his primary studies. At the beginning of 1870, he carried out his studies in the humanities course at Seminário das Mercês (catholic school) and a preparatory course at Colégio São Paulo in São Luís, capital of Maranhão. In 1882, at the age of 20, he moved to Bahia when he entered the University of Medicine. In 1885 he transferred to the Faculty of Medicine of Rio de Janeiro where he completed the fourth year of the course. He directed *Gazeta Acadêmica* (Academic Gazette) between 1885 and 1887, a journal of the students’ academic production inspired by *Gazeta Médica da Bahia* (Bahia Medical Gazette) (May, 1995; Corrêa, 2005–6). In 1886, he went back to Bahia to attend the fifth year of the course and to intern at Santa Casa de Misericórdia. He completed the doctorate at the Faculty of Medicine of Rio Janeiro in 1888 with the thesis *Das amiotrofias de origem periférica* (Amyotrophies of peripheral origin). In 1888, he returned to São Luís, state of Maranhão, and started to practice at the clinic. Also in this period, he wrote works on public hygiene and leprosy, in an attempt to organize a classificatory framework of races in Maranhão (Corrêa, 2005–6; Rodrigues, 2015). In the following year, 1889, he returned to Salvador in Bahia, where he assumed the chair of clinical medicine at the Faculty of Medicine. From 1891, due to the Reform by Benjamin Constant (1833–1891) in medical education, his academic and professional performance turned to Legal Medicine, when he assumed the chair of the discipline as a substitute for Virgílio Damásio (1838–1913), who was elected senator. In this position, he carried through Damásio’s proposals, implementing practical education and the formation of Legal Medicine professors as

forensics, as well as he promoted the reach of forensic practices developed in the lunatic asylums for the courts. In the same year, he stood out as editor in chief of *Gazeta Médica da Bahia*, Brazil's first medical magazine founded in 1866. It was an extremely important vehicle for scientific dissemination at the time. After four years as a substitute, following Damásio's retirement in 1895, he assumed the chair of Public Health Medicine. Together with other doctors, he was the founder of Legal Medicine Society of the state of Bahia, of which he was also president of editorial board and member organizer of the *Revista Médico Legal da Bahia* (Bahia Medical Legal Magazine), an organ of the Society (Corrêa, 2005–6). Until his early death at 44 in 1906, he influenced the debates and institutionalization processes of Legal Medicine in Brazil. In 1894, he published his first book *The Human Races and Penal Responsibility in Brazil* and dedicated it to the founding doctors and jurists of the Italian criminology school formulated by Cesare Lombroso (1835–1909) (Corrêa, 2005–6; May 1995; Rodrigues, 2015). In the book, Nina Rodrigues systematized his lessons in Legal Medicine, whose direct associations between race and criminality consisted of a frank articulation between the criminalization of black bodies from the perspective of psychiatry and anthropology, instrumentalizing legal scientific-medical practice in the country. In addition, Nina Rodrigues also advocated the existence of different penal codes for different races.

Within the scenario of the late nineteenth and early twentieth centuries, Nina Rodrigues' intellectual trajectory spanned three scientific fields: legal medicine, psychiatry, and anthropology. His discussions in these fields made a mark on what, in the following years, came to be considered as a privileged theme of legal and social psychology. In the psi knowledge field, in his dialogues with peers in Bahia and Rio de Janeiro, he portrayed the scientific-institutional constitution in the Brazilian Empire. The Rio de Janeiro school, located at the headquarter of Imperial and later Republican authorities, had resources and was rapidly

advancing toward institutionalization at the time. But, as Nina Rodrigues himself pointed out in different journals and *Gazeta Médica*, Bahia did not keep pace with this process of the scientific field institutionalization and consolidation.

Nina studied typical themes of psychology in the writings of the early 1900s, such as *Psychic Atavism and Paranoia*, published in *Archives d'Anthropologie Criminelle de Lyon* in 1902; and *The Paranoia of the Negros*, from the following year, published in the same magazine. In this 1903 article, Nina Rodrigues pointed out the importance of the foundation of clinical studies in psychiatry and the education of medical professors in Brazil, after the reform of medical teaching (1879 and 1884), from the chair in Rio de Janeiro. At the time, the psychiatric school of Rio de Janeiro was under the supervision of João Carlos Teixeira Brandão who worked in the clinical service of the Hospital Nacional de Alienados, which was headed by Juliano Moreira, whose management between 1903 and 1930 expanded the institution's medical staff, fostered the psychiatry as a specialty and intensified medical teaching.

A pioneer in investigating Afro-Brazilian religious cults in Bahia (Corrêa, 2008), Nina Rodrigues noted that the development of psychiatry in the state of Bahia, at the time, was restricted due to the low organizational capacity of the only clinical institution with the potential for debate on psychiatric studies: the São João de Deus Asylum. It was even at this institution that Nina Rodrigues practiced and developed studies with Black people such as Umbelina Maria do Bonfim (1840–1914), hospitalized in 1901 and considered by him as a classic case of paranoia with delusions of persecution and auditory hallucinations.

Black people, such as Umbelina, were the target of Nina's interest, which characterized a relationship of origin from psychology in Brazil. This is because he was one of the Brazilian intellectuals who developed a unique interpretation of the scientific racism model that emerged in Europe, based on the artifice of miscegenation (at first, as an atavistic relationship associated with

degeneration, therefore, for Nina Rodrigues, racial crossing was considered undesirable). Such a medical-psychological model has since exercised a structuring influence in Brazilian society, with reflections felt, at the common sense level, until today. The Black was inserted in this network of meanings as an element that carries certain pathological characteristics and is consequently liable to be the object of investigation of psi knowledge (Martins, 2019).

Therefore, Nina Rodrigues's whole work is tainted with psychiatric practices under a medical-scientific pretext for proposing diagnoses with racial bias. Its permanent emphasis on the theme of criminality among Black people influenced Brazilian social thought and medical hospital, asylum, and legal practices throughout the twentieth century, a fact that allows elucidating aspects of how the racial issue was present in the historical construction of psychological knowledge in Brazil.

Academic Leadership

Norma O'Neill de Cooney is the daughter of Luis O'Neill de Milán, librarian, and Josefa Calzada, catalog specialist. She attended Pedro G. Goyco Elementary School and Central High School, public schools located in San Juan, Puerto Rico. Her sister Celeste O'Neill was also a psychologist and professor at the University of Puerto Rico. Her aunt Ana María O'Neill was a psychologist and professor of Business Ethics, and her nephew Francisco O'Neill Susoni was a clinical psychologist, professor of Ethics, and lawyer. In 1948, she married Dr. Michael J. Cooney (1922–1981), professor of Economics at the University of Puerto Rico, and had two children: Michael John and Diane Marie. As used to be the custom in Puerto Rico, after her marriage, she added her husband's

last name to her own and became Norma O'Neill de Cooney.

At the University of Puerto Rico, Río Piedras Campus, Norma O'Neill earned a Bachelor of Science in Commercial Education, with High Honors, in 1945. She graduated with a Master of Arts Degree in Psychology at Teacher's College, Columbia University, in 1949. She completed her Doctoral Degree in Developmental Psychology at Columbia University in 1967. The title of her doctoral dissertation is *Control of Aggression in Child Rearing in Puerto Rico: A Study of Professed Practices Used with Boys and Girls in Two Socioeconomic Urban Groups*.

Norma O'Neill de Cooney's long career at the University of Puerto Rico, Río Piedras Campus (UPR-RP), began in 1949 as an instructor in Psychology at the Social Sciences College. She became assistant professor in 1955 and served as academic counselor since 1959. In 1962, she was appointed permanent faculty member and also served as vocational counselor to disabled veterans of the US Armed Forces. After completing her doctoral degree in 1967, she was appointed full professor and Director of the Psychology Department, College of Social Sciences (Personnel Record, 1949–1988).

Dr. O'Neill de Cooney was involved in several research and service projects at the UPR-RP. She was coresearcher with Myrna Sesman and Carlos Guevara in the study "Growth and Development of Children in Puerto Rico." In 1968 and 1969, she was a trainer for the Peer Counseling Program

at the University of Puerto Rico System, which involved students and faculty at several college campuses (Personnel Record, 1949–1988). She was active in promoting curricular reform at the Psychology Department and developed partnerships with institutions outside of Puerto Rico such as National Training Laboratories. She also recruited faculty members from prestigious universities in the United States to reinforce specialized areas of psychology such as Research Methods and Statistics.

In 1975, Dr. O'Neill de Cooney returned to teaching at the Psychology Department after serving as chair, during 7 years. She then traveled to several countries to study Training Centers for Industrial Organizational Psychology, in order to suggest innovations for this specialty at the UPR Psychology Graduate Program. She also traveled to professional conventions, including the XXIII International Congress of Psychology at Mexico in 1984. In 1988, she retired from her position as full professor and moved to Florida with her daughter.

Dr. O'Neill de Cooney was among the founding members of the Puerto Rico Psychological Association in 1954 and the first treasurer in the first Board of Directors of the Puerto Rico (Roca de Torres, 2006). In 1993, she was honored as distinguished female leader in Psychology by the same organization. In 1959, she represented the Psychology Faculty of the University of Puerto Rico at the Second Conference of Mental Health in the Caribbean, held in St. Thomas, US Virgin Islands. She was also a member of the American Psychological Association (APA) and Pi Lambda Theta Honor Society in Education.

Dr. Norma O'Neill de Cooney is remembered for her dedication to teaching, mentoring of students, and promotion of educational innovations. She was also a pioneer of Puerto Rican Psychology, supporting the development of psychological organizations and graduate programs since the middle of the twentieth century.

Ana María O'Neill was the third daughter of Luis O'Neill and Ana Elenteria Milán, and her siblings were Luis, José, Arturo, Francisco, and Rita O'Neill Milán. Her father was a writer and notary for the government, two endeavors closely related to Ana María's future roles as author of several books and professor of secretarial students. She began her education at the city of her birth, Aguadilla, in the Northwestern Coast of Puerto Rico. She earned an associate degree in Education at the University of Puerto Rico (UPR-RP) in 1915. As a distinguished member of her graduating class, she was elected secretary and was recognized for her academic achievements. She became a public school teacher at Central High School, one of the best schools of the time in Puerto Rico. While working she continued to study at UPR-RP, where she completed the Bachelor's degree in

Education in 1924 with a major in Spanish. In 1927 she completed a Master's degree in Educational Psychology at Columbia University in New York City.

Upon her return to Puerto Rico in 1928, Ana María O'Neill was hired to teach at the College of Education, of the University of Puerto Rico, Río Piedras Campus (UPR-RP). Later she became the first female professor at the College of Commerce, now known as College of Business Administration, at UPR-RP. She was Chair of the Department of Spanish and Ethics in Business. A highly admired teacher for decades, she authored books that became required textbooks for students of business, ethics, and cooperativism. She retired from the UPR in 1961.

O'Neill was a humanistic psychologist who questioned the tenets of behaviorism, their emphasis on quantitative measures, and materialistic psychology that denied the existence of rationality, free will, and spirituality (Gonzalez Rivera, 2006). She explored ideas outside the behavioristic paradigms dominant in psychology in the United States, such as the writings of philosophers who embraced spirituality and research on parapsychology. According to O'Neill, human beings are rational, have values and free will, and are able to assume ethical behavior. She considered rationality an essential ingredient for ethical behavior and for a free society. These notions about human psychology and ethics and their importance for democracy are present in many of her writings and lectures (O'Neill, 1942, 1946, 1948). Her humanistic viewpoint was not always favored by colleagues in psychology, whose preferred areas of study adhered to quantitative measures, such as test construction, in which many psychologists in Puerto Rico were involved, and she was accused of being "nonscientific" (González Rivera, 2006; O'Neill, 1980). On the other hand, her commitment to humanistic psychology as a foundation for a democratic society is germane to the principles of cooperativism. Perhaps it laid the foundation for her intense involvement in the Cooperative Movement.

Prof. O'Neill became involved in this economic and sociologic movement, which promoted financial growth with participation of communities, during the first decade of her career as a

college professor. She identified herself with the philosophy and principles of the Rochdale Cooperatives and the Antigonish movement led by Catholic priests from St. Francis Xavier University at Antigonish, Nova Scotia, Canada. In 1939, she visited the Antigonish Social Movement in Canada and met several leaders of this social movement, including Father James J. Tompkins (1870–1953) and his cousin, Father Moses Coady (1882–1928) (Baralt, 2013). She enrolled at the Rochdale Institute of the National School of Cooperativism, where she became certified as a cooperative leader. She began to promote cooperatives as an option for economic growth with a humanistic perspective and community participation.

Ana María O'Neill invited Monsignor Moses Coady (1882–1959) to Puerto Rico, but he could not accept the invitation for health reasons. He asked Father Joseph A. Mc Donald (1908–1967), a professor at St. Francis Xavier University, to present lectures about the cooperative movement and principles, at the University of Puerto Rico. Father Mc Donald lectured at UPR during the summer sessions of 1945 and 1946. His teachings attracted the attention of several leaders in the community, including the Honorable Luis Muñoz Marín, then President of the Senate, who later became Governor of Puerto Rico. Muñoz Marín appointed a Commission to travel to Canada and study the development and implementation of the cooperative movement. The Commission recommended actions related to developing cooperatives in Puerto Rico, which included enhancing education and social reforms. One important achievement of these efforts was the approval of Law 291 of April 9, 1946, *General Law of Cooperative Societies of Puerto Rico*,

Ana María O'Neill continued to promote the cooperative movement, within the University of Puerto Rico, by supporting the creation of the Institute of Cooperativism in 1953. This institute has continued educating about cooperativism to this day and in 2021 offers courses at the Bachelor's level and a Master's degree and promotes research on cooperativism in Puerto Rico.

Prof. O'Neill was active in promoting women's participation in civic life, especially urging them to defend their right to vote. She was a founding member and secretary of the Block of

Non-Partisan Women, an organization that promoted women's vote. She also was cofounder and vice president of the Association for the Protection and Defense of Children, which promoted improvements in the school system of Puerto Rico.

The Puerto Rico Psychological Association invited Prof O'Neill, one of its members, to be keynote speaker at the sixth Annual Convention held in San Juan in 1960. The title of her presentation was *Another Dimension of Culture*, and she expressed the need to do research on the social impact of economic transformations such as industrialization (El Mundo, April 16, 1960). This presentation reveals her commitment to integrating psychology, with a humanistic perspective to her roles as educator within the College of Commerce, and her concerns for the social impact of economic growth.

In 1966, O'Neill was honored by the Union of American Women who named her the 1966 "Woman of Puerto Rico." That same year she was recognized by the cooperative establishment of the island and was named "Woman of the Americas."

O'Neill was the author of many books and articles that focused on a variety of topics: ethics, cooperativism, and business communication, among others. She received an award from Northwestern University in 1938 for her manuscript entitled *The Intangible Frontier*. This book was later translated as *Ethics for the Atomic Age*. Her text *Psychology of Communication*, written in Spanish, was published in 1971 and in 1991, 10 years after her death; the ninth edition was reprinted for the ninth time. These two books and others related to secretarial skills were used for many years as highly regarded textbooks for college course, and their editions were reissued many times.

Her contributions to the College of Business Administration at the University of Puerto Rico, Río Piedras Campus, were recognized by two outstanding honors: Professor Emeritus, after her retirement, and the naming one of the buildings on campus after her. The Certificate to change the name of the Business School building to Ana Maria O'Neill was approved by the Academic Senate on May 13, 1986, and certified by Chancellor Juan R. Fernández.

Prof. Ana María O'Neill was a trail blazer in many fields: promoting a humanistic and ethical education for leaders in business, enhancing the cooperative movement as an option for economic growth that included community education and participation and promotion of women's rights and empowerment in the community. Her contributions impact several disciplines but were inspired by her background in Educational Psychology and her commitment to the development and well-being of individuals and communities.

Francisco O'Neill Susoni was the son of Dr. Francisco O'Neill Milán, a physician, and Ana María Susoni Lens. His father died when Francisco was a child and he spent his childhood in Arecibo and later in San Juan, Puerto Rico, in the home of his maternal grandparents Francisco Susoni Absen and Ana Lena Cuenca. His father's family included university professors of Psychology: Ana María O'Neill, Norma O'Neill de Cooney, and Celeste O'Neill de Pumarada. He married Alma Font and was the father of four children: Herman, Any, Jorge, and José.

He attended the University of Puerto Rico (UPR-RP) where he obtained a bachelor's degree and a Juris Doctor. In 1969 he completed a master's degree in Psychology. His master's thesis entitled *Intelligence and reason in mankind* focused on the applications of logotherapy to clinical practice in

psychology. He obtained a doctoral degree in Clinical Psychology in 1970 at Union Graduate School.

Francisco O'Neill Susoni began his career as a lawyer, serving in the Courts System of Puerto Rico. He was also judicial officer for the President of the Puerto Rico Supreme Court. He became a professor of Business Ethics at the University of Puerto Rico, Río Piedras Campus, where he began graduate studies in psychology during his sabbatical year in 1968. He also taught Ethics at Caribbean Central University, a Medical School in Bayamón, Puerto Rico. He was a consultant for a training program for public servants, Program for Excellence in Government, and offered seminars on family communication as a volunteer of the *Programa para Un Mundo Mejor* (Program for a Better World). This program is sponsored by a nonprofit organization which promotes spiritual growth in the community. It offers workshops and educational events for couples and families, with emphasis on communication, conflict resolution, and promotion of mental health.

Upon completing his degrees in psychology, he established a private practice in clinical psychology that spanned five decades. He was an expert in humanistic psychology and studied principles of Logotherapy with Victor Frankl (1905–1997), whom he invited to Puerto Rico to present specialized seminars. He also completed training in hypnotic regression and supported hundreds of patients in the process of recovering from traumatic events, catastrophic illnesses such as cancer, and other personal challenges. During the final years of his life, he had several health problems, including loss of vision, but this did not stop him from serving his extensive clientele. On the day of his final hospitalization, he first completed a therapeutic session, and there were appointments on his calendar for clinical services for weeks after his death.

Dr. O'Neill-Susoni was a talented singer and actor who belonged to the Choir of the University of Puerto Rico and performed in musical theater. Throughout his career as a university professor and practicing psychologist, he continued pursuing his love of music and acting and was an active supporter of arts and culture in Puerto Rico. He presided the Board of Directors of *Fondo Nacional para el Quehacer Cultural* [National Fund for Cultural Endeavors], the Board of

Fundación de Zarzuela y Opereta de Puerto Rico [Foundation for Spanish Musical Theatre and Operetta of Puerto Rico], and the Board of the Institute of Puerto Rican Culture.

During the celebration of the Puerto Rico Psychological Association's Fiftieth Anniversary in 2003, Dr. O'Neill was a keynote speaker and narrated how he integrated his career as a psychologist with his passion for arts and culture. He demonstrated the importance of cultivating arts within psychology, by performing with the University of Puerto Rico Alumni Choir in a musical presentation of their repertoire.

Francisco O'Neill-Susoni excelled in his careers as clinical psychologist, lawyer, university professor, public servant, actor, and promoter of arts and culture. He was appreciated by colleagues, patients, and the community for his warm, outgoing personality, sensitivity, and kindness. He made a difference in the lives of numerous people and contributed to the community in a variety of areas, including psychology, ethics, public service, and the arts.

Oblitas-Guadalupe, Luis Armando

Born *Lima, (Peru), 14 September 1950*

Died *Lima, (Peru), 12 October 2019*

Tomás Caycho-Rodríguez
Universidad Privada del Norte, Lima, Peru

Keywords

Peru · Health psychology · Psychological journals

Luis Armando Oblitas studied psychology at the Universidad Nacional Mayor de San Marcos (National University of San Marcos, UNMSM, Lima), graduating in 1975, received a master's degree in Psychology (Clinical Area) from the Universidad de Santo Tomás (Saint Tomas University, Bogotá, Colombia, 1981) and a PhD in Psychology of the Universidad Nacional Autónoma de México (National Autonomous University of Mexico, 1989).

Oblitas practiced undergraduate and postgraduate university teaching in Peru, Colombia, Mexico, Spain, El Salvador, Guatemala, Bolivia, Puerto Rico, Costa Rica, and Mexico, also holding different management positions in the university institutions where he taught. In recent years, he was a research professor at the Universidad Autónoma del Perú (Autonomous University of Peru, Lima) until his death. He participated as a lecturer and coordinator of symposia in international psychology congresses in Costa Rica, Chile, Brazil, El Salvador, Cuba, Colombia, Guatemala, Peru, and Mexico.

He published books dedicated to psychotherapy and health psychology. Likewise, he founded several journals: *Revista Intercontinental de Psicología* (1988), *Psicología Contemporánea* (1994), and *Psicología Iberoamericana* (1988).

His work focused on health psychology, based on the biopsychosocial approach and with an integrationist perspective (Oblitas, 2004, 2005, 2006a, 2006b, 2007). In her latest studies, she investigated the predictive psychological variables of quality of life in patients with breast cancer (Ocampo et al., 2011), risk indicators and communication in mental health on the use of psychoactive substances and intrafamily violence in community leaders (Ferrel Ortega et al., 2017), the incidence of mindfulness and qi gong in the state of health, psychological well-being, life satisfaction, and work stress (Oblitas-Guadalupe et al., 2017), the construction of psychometric instruments for measure depression and emotional regulation (Moscoso et al., 2018), the incidence of mindfulness in academic stress in university students (Oblitas et al., 2019), and the impact of mindfulness on health and work stress in university workers (Oblitas Guadalupe et al., 2019), among others.

Oblitas was an important specialist in the area of health psychology, known throughout Latin America for his numerous works.

Venezuela · Humanistic psychology ·
Orientation · Psychological counseling

In 1962, at the age of 18, he entered the third cohort of the Psychology program at the Universidad Católica Andrés Bello (UCAB) (Andres Bello Catholic University), where he graduated at the age of 22 (1967). After completing his studies, he enrolled in the postgraduate

program of Psychological Orientation at the same university. During his graduate studies, he was presented with the proposal to organize the Psychological Counseling Center at Colegio La Salle, a Catholic educational institution located in Caracas. After founding it, he directed it for a year providing attention to a population of more than 250 high school students.

In 1968, he resigned from this position and became a Counseling Psychologist at the Center for Psychological Guidance (COP) of the UCAB, and that same year he assumed the direction of the COP. Simultaneously to this work, he taught in the Chair of Psychological Counseling and the Chair of Methods of Psychological Exploration in the Escuela de Psicología (School of Psychology) of the UCAB and collaborated with the Chair of School Counseling of the School of Education of the UCAB. At the age of 25, he graduated as a Specialist in the Postgraduate Program of Psychological Orientation (1970).

Ochoa identified with the humanistic movement, which was in full expansion in the 1970s. He was trained in various psychotherapeutic approaches centered on the person: Gestalt, Transactional Analysis, proposed Logotherapy and Existential Psychotherapy.

Between 1971 and 1974, he was trained as a group facilitator at the Escuela de Formación del Caribe (Caribbean Formation) and at the Instituto Venezolano de Formación Interprofesional Psicosociológica (IVEFIP) (Venezuelan Institute of Interprofessional Psychosociological Training). He also received training as a group facilitator at the *Institut Français de Formation et d'Enseignement Psychosociologique* (IFFEP, French Institute for Psychosocial Training and Education) in Paris, where he was also trained in *Orientation Analytique Existentielle* (Existential Analytical Orientation) (Ochoa, 1971).

In 1976, he was trained as a facilitator of the Effective Parenting with Systematic Training Program (Peces). In 1978, together with other colleagues, he founded at UCAB a School for Parents directed to the community. In the same year, he began training in Gestalt Psychotherapy with Manuel Martínez Toro (1940) and with the Chilean-Venezuelan psychologist Niksa

Fernandez. This training lasted 3 years and, in the end, he was invited to join the group of psychotherapists who worked in the foundation of the Venezuelan Institute of Gestalt (IVG). In addition to being a founder, for a time he worked as a teacher at this institute.

Between 1978 and 1980, he was part of the founding teams of several organizations aimed at training and psychological orientation, such as IVEFIP, Postgrado de Dinámica de Grupos (Group Dynamics Postgraduate – UCV), and Asociación Venezolana de Sexología Psicológica y Orientación Sexual (Venezuelan Association of Psychological Sexology and Sexual Orientation). Ochoa is also a board member of several organizations, among which are mentioned the following: Venezuelan Association of Psychological Counseling, International Association for Transactional Analysis (ITAA), Latin American Association of Transactional Analysis (ALAT), and Venezuelan Association of Transactional Analysis (AVAT). He was also trained in EMDR Therapy (Eye Movement Desensitization and Reprocessing), levels I and II.

He was a founding member of the Board of Psychologists of Venezuela (1968), serving as vice president of the Federation of Psychologists of Venezuela (the institution that replaced the Board of Psychologists of Venezuela), during the period 1982–1984, and president of its disciplinary tribunal.

He was appointed Director of the School of Psychology at UCAB (1983), a position he held for 9 consecutive years. After leaving the directorship, he continued as professor and psychologist of the Center for Counseling and Human Development (CADH), former COP, of which he was Director in two periods: 1968–1970 and 1980–1983.

He founded the Cognitive Psychology Postgraduate Program at UCAB (1985), where he taught the subjects Psychological Counseling Techniques and Group Counseling (1986–1988). He was also promoter and founder of the first postgraduate subjects in the psychological area at UCAB: “Organizational Development” and “Child Development and its Deviations.” In

addition to tutoring several undergraduate and graduate theses.

His main contribution has been in the foundation of organizations in favor of psychology in Venezuela, being an outstanding representative of the humanistic approach.

André Luis Masiero

Universidade Federal de São Carlos, São Carlos, Brazil

Keywords

Brazil, Social psychology · Anthropology · Race

Anthropologist, jurist, professor, and Brazilian historian. Graduated from the Faculty of Law of Rio de Janeiro in 1906, where he became professor of Criminal Law in 1916.

Nationalist, he dedicated several works to the analysis of racial miscegenation. Influenced by racist theorists like Joseph Arthur Gobineau (1816–1882) and Gustave Le Bon (1841–1931) he defended the idea that human races could be organized by their physical qualities and psychological aptitudes. Examining what he called “race psychology” or “ethnic psychology”. He favored the selection of immigrants by “assimilable psychological types” by the national environment and culture. He also argued that data from psychometric research showed statistically that the white races concentrated a higher number of superior intelligences, since the races would be in different evolutionary stages. For this reason, he opposed the reception of Japanese immigrants, who were “culturally insoluble”. When he allied with the dictatorial government of Getúlio Vargas (1937–1945), he opposed the granting of visas for the entry of Jewish refugees into Brazil during World War II, in line with the eugenic and social Darwinist conceptions, although he was a radical critic of German National Socialism, for its brutality and disrespect for the territorial sovereignty of neighbors and based on a biased racial theory.

However, he applied eugenics in the analysis of national populations. In the essay, *The Brazilian type and its forming elements from 1928*, he exposes what believes to be the differential subjective traits between whites, blacks, and indigenous people, basic national constituents. As a naturalist, he classified the races morphologically and psychologically and precisely because of their characteristics he considered it impossible to build a liberal nation along European lines.

With the publication of *Race and assimilation* (1932), he disputed with another Brazilian anthropologist, Arthur Ramos, who accused him of basing his conclusions on the “capabilities of the black race” on “science of the last century”. In response to Ramos’ criticisms, he reaffirmed his beliefs in the psychological superiority of the white races. Controversial and known for his authoritarian thinking, he says that “200 Hindus were not worth a handful of Englishmen, who dominate them”. Although psychology, as a natural and autonomous science, was not exactly the center of its scientific interests and activities, he was one of the pioneers in the interpretation of the

relationship between man and the environment and culture based on social psychology. He was undoubtedly one of the pioneers in Brazil from the perspective *Völkerpsychologie*, initiated by Wilhelm Wundt (1832–1920) at the beginning of the twentieth century and one of those responsible also for disseminating in the country many researches on Differential Psychology developed by American and European psychometrists.

In his intellectual trajectory, from his social psychology, another interdisciplinary area derives, political psychology, that is, the analysis of social and party organization based on the prevailing mental traits in a collectivity. Brazilians, accord him, would not have psychological traits for a good political organization, starting with the lack of a sense of collectivity.

In 1926, he assumed the position of Director of the Instituto do Fomento do Estado de Rio de Janeiro (Rio de Janeiro State Promotion Institute) and, in 1934, he was a collaborator of the Special Constitution Review Commission. In 1937, he was a legal consultant with the Ministry of Labor, Industry, and Commerce and in the same year elected to chair 8 of the Brazilian Academy of Letters. He was a member of many scientific associations such as: International Institute of Anthropology, Société des Americanistes, Paris, Academy of History of Portugal.

It can be said that Oliveira Viana brought a set of psychological knowledge to support his primary fields of activity, like anthropology, politics, legislation, etc., thus revealing the potential of this new science for national development.

Mexico · Psychology of religion · Embryology

José María de Jesús Melquiades Olvera Lechuga was the oldest of ten siblings. He is a surgeon who graduated from the Facultad de Medicina (Faculty of Medicine) (1855–1862) of the Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM). His father and grandfather were surgeons as well. Even his father, Isidoro Olvera Crespo (1815–1859), ventured into politics and was part of the Congreso Constituyente (Constitutional Congress) of 1856 and the I Legislatura (I Legislature) of 1857–1861. José Olvera's contribution in the field of medicine was the study of “embryology” that he wrote in 1902. In this work, Olvera demonstrates the relationship between psychology and religion.

Olvera's main objective is to make clear the influence of religion in Mexican thought in the late nineteenth century. His work rests on describing the intrauterine development of man, without omitting detail or circumstance; however minute it may seem. The author highlights each of the stages in the development of the embryo. The strength of the work in relation to religion is supported by the opinions of colleagues such as the Spanish histologist Ramón y Cajal (1852–1934) who congratulates Olvera for opposing any other explanation that departs from religion, making a strong emphasis on the power, wisdom, and providence of God. The way they describe the embryologist as well as the anatomist, the histologist, or the bacteriologist is not enough to understand human nature when they are truly in the hand of God; scientists are not capable of understanding divine nature. The relationship between religion and science for Olvera was evident so he lets us see in the following quote "It cannot be denied that a wise man, full of intelligence, with privileged understanding, is almost ignorant of anything in the current state of knowledge; but incredulous and materialistic, he does not know what matters most to him to know: that God is his creator and teacher; that everything that is, is owed to Him; granting only to the power of his reason" (Olvera 1904, p. 12).

Olvera's belief and deep-rooted faith led him to question his own discipline; for the author there is nothing in this earthly world that can be explained only with science. It is necessary that sciences such as chemistry, physics, mathematics, and medicine seek God, only through the explanation that comes from him. This world can be understood. Olvera shows that science cannot be explained without the help of God "Doctor! If you consider yourself wise, it is necessary, so that you really are, that you bow your head in adoration of the Almighty, the Wise, the Loving, the God the Father, God the Son, God the Holy Spirit, who made man" (Olvera 1904, p. 19).

The tireless struggle that Olvera sustained with the Marxist and positivist currents of thought can be seen in the dedication he made to Canon Emeterio Valverde Téllez (1864–1948), where he points out in his own hand the importance of having written this work that opened the eyes to

the world of science attached to the faith and religion it professes; finally, we can highlight that the publication of this work had the approval of the church, since the work includes on the second page the message of the Archdiocese of Mexico that "it has served to grant its superior license for it to be printed and published [...] For being the work of true merit and utility" (1904, p. ii). This allows us to speak of the fact that the explanation proposal of embryology, psychology, and religion obeyed the thought of the eighteenth century, where sciences (whether social or natural sciences) were tied to religious thought that manipulated any scientific explanation in favor of God.

His works focused on mental health considering the religious aspect as relevant to understand the human being. His 1904 text synthesizes his vision of the religious perspective in the human being; in the emerging discipline of "psychology," the influence of religion and the attachment to explanations of life from the perspective of the religious world and the way of narrating the events of the conception of life allows us to consider the proximity that science had in the nineteenth century, with a country attached to religion like Mexico.

Despite the fact that it is the only work that the author has, the influence of religion and the attachment to explanations of life from the perspective of the religious world and the way of narrating the events of the conception of life allow us to propose the proximity that occurs in the field of psychology and religion.

In his 1895 speech on marriage and mental health, he introduced the religious element to justify the subject. López Ramos (1997, p. 90) points out that "he sees neurosis as a social disease that can be treated with medications, a circumstance that was not feasible in his time. Given this, he proposes morality as an alternative, which must be the possible instrument so that the mentally ill do not marry and have children with hereditary and degenerative diseases," a discourse that clearly refers to the religious spirit of the time, which is shown in scientific analysis and thought.

Olvera's proposal influences the heart of Mexican psychology, since the antipositivist approach impacted on religious studies such as the one

developed by Olvera himself; years later his proposal would serve to explain the influence that religious thought had in Mexico. If we consider that José Olvera is a faithful believer in religion, his proposal rests on spinning two opposite poles, religion and science, under his gaze scientific thought that is incapable of knowing and explaining something as complex as “life.” Perhaps one of the strongest criticisms of his work is due to the fact that Olvera is strongly attached to the religious world, that is, it is not a question of a psychology of religion as we will know it later but of religious thought in psychological processes. In this regard, it is worth mentioning the study of religious pastoral care in psychological development; in fact, in 1976, at the Congress of Psychology of Religion in Lancaster (United Kingdom), it was argued that “the psychology of religion cannot be studied by those who adopt an agnostic activity on the content of religious beliefs” (190). And also the work of James (1902), and of American colleagues Milton Rokeach (1918–1947), Bernard Spilka (1926), Richard Gorsuch (1937–2016) and French (Jean-Pierre Deconchy (1934–2014), important researchers for the scientific study of the psychology of religion.

The discourse that is exposed in this work is a reflection of the Catholic and traditionalist thought that permeated the Mexican society at the end of the nineteenth century. The Catholic attachment of some doctors of the time such as José Olvera could not separate the religious explanations from science. This is why his work came before his other colleagues such as Pedro Noriega (1855–1901), Manuel Flores (1853–1924), and José Ramírez (1852–1904) of all those who sought to explain the creation of the human being from the positivist current of the origin and psychic thought.

Although it is true that the work of José Olvera is not recognized in the field of medicine as a scientific explanation, in the field of psychology, it is a precedent to understand Mexican scientific thought at the end of the nineteenth century that was still permeated by religion [Catholic]. For the Mexican society, the Spanish conquest not only occurred with the expansion and domination of the Spanish crown in Mexico [which had

conquered Mexican territory in 1510]; it was an ideological conquest that expanded in the scientific field. José Olvera’s work is an example of the predominance of religion in the Mexican society.

Oñativia, Oscar Venancio

Born *Salta, Argentina, 18 May 1919*

Died *Salta, Argentina, 24 January 1995*

María Eugenia González
Argentine Scientific and Technical Research
Council, Buenos Aires, Argentina
National University of Salta, Salta, Argentina

Keywords

Argentina · Psychometrics · Psychotechnics ·
Perception · Educational psychology ·
Institutions

Oscar Venancio Oñativia attended elementary and high school in the city of Salta, Argentina, and university in the city of Buenos Aires, Argentina. He graduated as a professor of Philosophy in 1943 at the Facultad de Filosofía y Letras de la Universidad de Buenos Aires (Faculty of Philosophy and Humanities at the University of Buenos Aires). Later, in 1964, he obtained his PhD in the same institution. His doctoral dissertation was entitled “Interpretaciones táctiles como procesos proyectivos” (Tactile Interpretations as Projective Processes) and it was published in 1972 by Editorial Paidós (Paidós Publishing House) under the title “Rorschach táctil” (Tactile Rorschach) (Oñativia, 1972).

In academical settings, as a professor, he was in charge of undergraduate and graduate courses at the Profesorado de Enseñanza (Teaching Degree) of the Province of Catamarca and at the National Universities of Tucumán, Cuyo, Salta, and Córdoba. He was also a visiting professor at universities in Brazil and Spain. As a researcher, he participated in Research Council Programs of the Universidad Nacional de Salta (National University of Salta), the Consejo Nacional de Investigaciones Científicas y Técnicas (Argentine Scientific and Technical Research Council), and the Fondo Nacional de las Artes

(National Fund for the Arts). He wrote more than 50 scientific papers and over more than 30 books in the areas of Psychometry, Psychotechnics, Psychology of Perception, and Educational Psychology.

He also participated in key congresses related to the organization of the psychological field in Argentina. He took part in the First National Congress of Philosophy, held in Mendoza in 1949, where there was a whole section dedicated to Psychology. In 1954 he was general secretary of the First Argentine Congress of Psychology, held in Tucumán. There he presented “Psicología, ciencia joven” (Psychology, a young science) where he proposed overcoming the crisis in the discipline by means of a symbiosis of theories that would include all the psychological approaches (Oñativia, 1955). His participation in this last congress was of special relevance for the academic institutionalization of Psychology in Argentina; it was there that Oñativia, together with other attendees, signed a declaration postulating the need to create undergraduate programs in psychology, oriented to educating and training professional psychologists (Dagfal, 2008, 2009; Klappenbach, 2006).

At the same time, he held executive positions and founded institutions related to Educational Psychology. In 1957, in his native province, he created the Departamento de Psicología Escolar y Asistencia Escolar (Department of School Psychology and School Assistance) within the Consejo General de Educación (General Council of Education). Oñativia led this Department until 1975. He also organized the first Experimental School in that province, called “Maestra Jacoba Saravia.” In addition, he provided the guidelines of the Curriculum for elementary education in Salta, in vigor until 1985. At the National University of Salta, he also served as Head of the Psychological Area, as Director of the Humanities Department and Vice provost. At the National University of Tucumán, he was appointed Director of the Institute of Psychology and Educational Sciences, based in Salta, from 1955 to 1973. Oñativia also held positions in organizations

outside the local sphere. He was appointed Director of the Regional Centre for Border Areas Studies and Advisor to the National Ministry of Culture and Education. He was also recognized by national and international organizations. He was appointed life member of the Argentine Society of Psychology and member of the National Academy of Education of Argentina (Oñativia, n.d.). He received the award of the Spanish Society of Psychology in 1977 and was nominated for the first International Literacy Award of the United Nations Educational, Scientific and Cultural Organization (UNESCO) in 1981.

Considering all the above, on the one hand, Oñativia can be regarded as one of the pioneers of Psychology in Argentina and one of the promoters of the creation of the first undergraduate programs in Psychology in the whole country. On the other hand, given his academic contribution, Oñativia became a theoretical reference of the psychological discipline, within the areas of Psychotechnics, Psychology of Perception, and Educational Psychology. His work in the creation, direction, and management of institutions aimed at promoting knowledge in Educational Psychology is also noteworthy. Finally, it is worth mentioning his work as a promoter of Psychology in the Spanish-speaking world, through his task of revising works translated from English into Spanish, for example, his work on the *A student's dictionary of psychological terms* by Horace English (1928/1951).

Oribe Coronel, Emilio Nicolás

Born *Melo, (Uruguay), 13 April 1893*

Died *Montevideo, (Uruguay), 24 May 1975*

Pablo Piquinela and Santiago Andrés Navarro
Universidad de la República, Montevideo,
Uruguay

Keywords

Uruguay · Vocational guidance · Institutional

Emilio Oribe was born in the city of Melo, in Cerro Largo, northeast of the country. The country's last civil war, known as 1904s Revolution, made the capital's urban culture face rural autocracy. This happening had its origin in Melo and led Emilio Oribe to move to Montevideo along with his family. He studied medicine in the Universidad de la República (University of Republic), graduating in 1919 (Scarone, 1918). He traveled to Europe the next year, where he came in contact with the artistic forefront, meeting European intellectuality personalities from that time, like Pablo Picasso (1881–1973), Paul Valéry (1871–1945), Henri Bergson (1859–1941), and Maurice Merleau-Ponty (1908–1961) (Rocca, 1993). On that trip he was designated as a Scientific Aggregate to Belgium's Uruguayan Legation. He practiced medicine until 1925, the year in which he went on to dedicate entirely to intellectual activity, also being a philosophy teacher until 1938 when he started taking over the Art and Literature-Aesthetic professorship, a chair that is free of superior studies in the Universidad de la República.

He published his first modernist style poems in 1909 under the name of Ismael Velarde in *La Razón*, a newspaper from Montevideo, as central references he had Julio Herrera and Reissig (1875–1910), Rubén Darío (1867–1916), and Leopoldo Lugones (1874–1938). Subsequently, French symbolism, particularly Paul Valéry, was a central reference in his poetic work (Rocca, 1993).

From 1925, the philosophical aspects that can already be seen in his first works became more relevant. As of 1930 he started publishing philosophical essays, fundamentally on the aesthetic field. Since the end of the 1920s he occupied different positions of institutional and political direction that led him to participate in different ways in psychology's institutionalization and professionalization process.

In 1929, in the midst of a reform proposal for primary education encouraged by Horacio Dura (1885–1977), he was nominated to integrate a commission that would promote the incorporation of psychology knowledge in the educational field. Psychology's concepts had a central role in the argumentation of a new teaching method.

In August 21, 1928, he was appointed Member of the Consejo Nacional de Enseñanza Primaria y Normal (National Council of Primary and Normal Teaching), and in December 16, 1931, he went on to occupy the position of vice president. In this context, he promoted the incorporation of experimental psychology in teacher training and presented a project for the creation of posts for medical specialists in psycho-pedagogy. This project encouraged the hiring of physicians with specific knowledge about experimental psychology and pedagogy so that they would be trained to perform medical-psychological exams and be collaborators of teachers and directors (Oribe, 1929). He encouraged the incorporation of vocational and professional orientation in educational institutions, a field of great development at the time that would play a fundamental role in the institutionalization of psychology in the country. In 1930 he proposed the creation of a vocational orientation specialized schools both for boys and girls. In addition, he dedicated himself to proposing laws that united the physical with the psychological, as well as to measuring abilities according to sex and detecting possible abnormalities (Oribe, 1930).

Later on, he participated in the process of the introduction of psychology in university settings. Along with the creation of the Facultad de Humanidades y Ciencias (Faculty of Science and Humanities), in 1945 he was designated member of the council that would lead the institution. He

was its dean two times: in 1951–1952, and then later in 1958 after the death of the then Dean Carlos Vaz Ferreira (1872–1958). He went on to fulfill duties for the complementary period from January of 1958 until October of the next year. Already as vice president in the year 1947 he was designated as president of the court for a competition for the Psychology Chair, which resulted empty. He was cofounder of the Sociedad de Psicología del Uruguay (Uruguayan Psychology Society) along with Vaz Ferreira, Clemente Estable (1894–1976), and Juan Carlos Carrasco (1923–2010) in 1953. In 1956, at the time of the approval of the undergraduate Psychology Program encouraged by Mario Berta (1920–2009), he integrated the Faculty of Science and Humanities' Council.

Emilio Oribe, from the positions he occupied in elementary education and in the University of Republic, took care of generating conditions for the institutionalization of psychology in those spaces. In 1964, he was named honorary doctor by the Faculty of Science and Humanities at University of Republic. In 1969 he was elected as president of the National Academy of Letters. And in 1975, in recognition for his intellectual trajectory and work, he received the National Great Price of Literature, awarded by the Ministerio de Educación y Cultura (Education and Culture Ministry). Emilio Oribe passes away in 1975.

Argentina · Psychoanalysis · Clinical model of vocational guidance · Psychodiagnostics · Rorschach technique

Born in Argentina, her first profession was obstetrics, an activity she practiced for many years, being an active member of the team of an important gynecologist and obstetrician in Buenos Aires.

In the mid-1950s, due to the spirit of the times, she became actively interested in psychoanalysis, psychodrama, and the study of the Rorschach technique. She was also interested in art, especially painting and film. All this led her to undertake formal studies in the undergraduate Psychology Program, from which she graduated in the late 1960s.

She was in contact with important personalities of the Argentine intelligentsia, psychoanalysis, and art. The direct teachings of the psychoanalysts Enrique Pichon Rivière (1907–1977), Fernando

Ulloa (1924–2008), José Bleger (1922–1972), and Eduardo Pavlovsky (1933–2015), among others, had a direct influence on the construction of the “conceptual, referential and operative scheme” (Pichon Rivière, 1960/1975) which, as a pioneer, Irene Orlando applied in the field of vocational guidance.

In that field of work, she was the forerunner in introducing a clinical perspective not only as a complement to the use of psychometric techniques, and eventually projective techniques, but also as the central axis of the approach to vocational guidance from the perspective of psychology as a profession.

Risieri Frondizi (1910–1985), Rector of the Universidad de Buenos Aires (University of Buenos Aires), promoted the creation of the Departamento de Orientación Vocacional (Vocational Guidance Department). Irene Orlando was appointed head of the Interview Section between 1958 and 1966. That year, she resigned after the episode known as the “Night of the Long Sticks.” The administration by General Juan Carlos Onganía (1994–1995), who had come to power through a *coup d'état*, intervened the university and the police invaded classrooms and scientific laboratories of the university. Before that night, the Vocational Guidance Department was the setting for the development of an original theoretical and practical approach to vocational guidance, based on psychoanalysis. That approach was a novel complement to the line of work of the Department’s director, Prof. Nicolás Tavella (1918–1994) and his collaborator, Nuria Cortada de Kohan (1921–2013), who were both specialized in applying more traditional resources in vocational guidance, such as psychometric techniques.

Irene Orlando gave specificity to psychoanalytic theoretical concepts and improved the technique of the individual clinical interview and the technique of the “operational group” (Pichon Rivière et al., 1960), applied to vocational guidance.

She established the use of diagnostic interviews for the detection of the so-called “point of urgency” (Fernando Ulloa) as a motive for consultation, and for the study of personality. The

interviews also were fundamental for the exploration of family history and constellation in order to analyze identifications in the construction of identity in adolescence. She designed “vocational orientation processes” for the elaboration of the anxieties inherent in the passage from high school to university, from the field of study to work, and from the more restricted family and social sphere to the wider social and institutional sphere. This process made it possible to analyze the motivations for choosing a career or entering the labor market in terms of the contextual data. And especially to discover the imaginations or fantasies, family mandates, and identification figures, among other conscious and non-conscious components of the family, social, educational, and cultural environment of the consultants. It was to Irene Orlando’s credit that she redefined vocational guidance as a process of elaboration on the part of the consulting students, in the manner of a brief and focused psychotherapy, rather than advice limited to the results of the application of intelligence, aptitude, and interest tests (Orlando, 1970).

The reflection on the task based on the records of the observations made it possible to establish a modality of interviews, individual or group, and also a frequency, which was finally standardized at eight weekly sessions, with the option of four additional sessions, to be requested by the consultant in the case of individual interviews, or by the group as a whole in the case of group interviews.

She also developed training techniques for professionals and advanced students in Psychology and Educational Sciences. These were based on observation and reflection on the work of experienced vocational counselors, on the supervision of all activities, and also on the use of psychodramatic techniques for the “simulation” of individual and group interviews with the aim of training in such a field.

She also encouraged research activities, articulated with clinical activity. She directed exploratory research projects: motivations for the choice of university studies, professional profiles, university desertion, all of them at the Vocational Guidance Department of the University of Buenos Aires, between 1964 and 1966. She also

conducted research on “Determinants of university interruption of studies” in the same period but at the Consejo Nacional de Investigaciones Científicas y Técnicas (National Council for Scientific and Technical Research).

Irene Orlando’s interest in art, architecture, psychoanalysis, and the theories of perception of her time also led her to become interested in the Rorschach technique, a field in which she was also a pioneer in Argentina. Her disciple Nélica Álvarez, on the basis of unpublished manuscripts, was able to collect and systematize in a book with her main contributions, related to the categories of time and space, location, and movement. This makes it possible to collect the transformations that account for the singularity of the interpretations made by the subject in response to the pictures, in a process that is constructed over time (Alvarez, 2010). She considered that the location, more than the determinants and contents, made the mental structure visible, and not only the emotional dynamics. She used the “technique of tracing,” initially developed by Cecile Beizmann for the administration of the Rorschach to children, to achieve precision in the localization of responses. Orlando argued that the spatial cut-out revealed the architecture of thought and the underlying body image; for this reason, the gap that can exist between the verbal formulation and what is graphed on the tracing revealed what was hidden in the word, while registering creative potentialities.

Irene Orlando held leadership positions in the Asociación Argentina de Psicodiagnóstico de Rorschach (Argentine Association of Rorschach Psychodiagnosis, AAPRO), whose creation in 1952 preceded the existence of the undergraduate Psychology programs in Argentina. The AAPRO promoted the first Latin American Rorschach Congress and the organization of the Asociación Latinoamericana de Rorschach (Latin American Rorschach Association, ALAR) in 1966. She also promoted the journal published by the AAPRO in 1969, initially entitled *El Rorschach en la Argentina* (Rorschach in Argentina) and since 1982 *Psicodiagnóstico de Rorschach y otras técnicas proyectivas* (Rorschach Psychodiagnosis and other projective techniques).

She was abducted by the repressive forces of the military dictatorship and was last seen on 8 December 1977 in the detention and torture center of the Escuela de Mecánica de la Armada (Navy Mechanics School, ESMA). She was 64 years old. A small square in the San Cristóbal neighborhood in the City of Buenos Aires, Argentina, has been named in her honor since 2003.

Cognitive development · Math learning

Mariela Orozco Hormaza is the daughter of Juan Enrique Guillermo Orozco (1908–1986), one of the founders of the Faculty of Medicine at the Universidad del Valle, Cali (University of Valle, Cali), and Blanca Hormaza (1915–2014). Both of her parents belonged to peasant and muleteer families established in Antioquia, all descendants of the Basque Country who fled from the poverty of their homeland (Guerrero & Rovetto, 2010). Her father Guillermo, with only 11 years

of age, left Anserma, Caldas, to study medicine at the Universidad de Antioquia (University of Antioquia).

Mariela did undergraduate studies in counseling psychology, a program created within the Education Faculty at the University of Valle in 1965 (Giraldo & Rodríguez, 2000), where she met one of her first teachers, Rubén Lechter, a Colombian psychologist trained in the United States in the area of marketing psychology; he was also a pioneer of qualitative research in Colombia. Orozco graduated in 1971 at the age of 30. During her studies, she showed a remarkable interest in social psychology and education in vulnerable contexts. From 1971 to 1974, she worked at the Escuela de la Trinidad (Trinity School), in Cali, where, as she claims, she met “the greatest misery that I ever lived in my professional experience. The children that came to school were so malnourished that they couldn’t tolerate the food we gave them” (Orozco, personal communication, December 15, 2019). From the witnessed poverty, she began to perform home visits and designed and applied a program of compensatory education for children in poor neighborhoods.

After finishing his doctoral studies, Rubén Lechter was hired as a faculty in the University of Valle, where he stood out for his community activism, a topic that was always part of the professional interests of Mariela Orozco. Lechter’s work was determinant in Orozco’s studies in the education of children in poverty contexts.

In 1974, Mariela Orozco was enrolled as a teacher in the University of Valle, where she forged an interesting interdisciplinary research career of, as she says, “commitment with the community experiences” (Orozco, personal communication, December 15, 2019). The beginning of her research career was accompanied by the work of her colleague Carlos Arango (1951–). The help and consulting of Forest Tyler (1925–2018) (Zea, 2019), an American psychologist who worked in the community and social fields proved to be fundamental in the introduction of a community approach in the Unidad de Educación Popular (Unit of Popular Education). In 1976, Rubén Lechter and Sonia Meluk (1949–)

requested approval from the Instituto Colombiano para el Fomento de la Educación Superior (ICFES) (Colombian Institute for the Promotion of Higher Education) to convert the counseling psychology program into a formal psychology program aimed to grant the degree of psychologist.

Once open, the psychology program introduced four seminars with community approach as the spine of the basic training in psychology (Arango, 2006). The work made by Orozco and her colleagues in the 1970s was revolutionary, as it allowed them to insert for the first time in Colombia the term *community psychology*.

During her first years as a teacher in the University of Valle, another event would take place in the outcome of Orozco's academic training: she took the courses on Jean Piaget (1896–1980) taught by Rebeca Puche-Navarro (1946–), who arrived at the University of Valle in the early 1970s after finishing her training in psychology at the Université de Geneve (University of Geneva), where she met and received lessons from Piaget himself. The courses dictated by Puche-Navarro, pioneer in Colombia on the topics related to Piaget and the experimental studies on child development, allowed Orozco to fully immerse into the field of children mental processes psychology; also, it allowed her to answer one of her research questions: what are the mechanisms used by the child in order to solve problems? The question itself was strongly related to her original interest on the community experiences in poverty contexts.

Mariela had some basic knowledge of Piagetian work because of the study of John L. Phillips Jr. (1923–2017) and his book: *The Origins of Intellect. Piaget's theory* (1969). Her subsequent training on Piaget's theories concurred with the Marxist intellectual and militant environment in the University of Valle, and she surrounded herself with many thinkers from all disciplines that helped her to sharpen a critical insight on society and reality that Orozco would keep during her entire life.

In 1975, she started a strenuous task as the coordinator of the editorial committee of the academic journal *Cuadernos de Psicología* (Psychology Notebooks), a task she would carry

out until 1991. Both the journal and her work as an editorial coordinator were related to the revision and publication of works made by not only Colombian psychologists but also visiting professors like Sidney Strauss (1940–) and Valerie Walkerdine (1947–) (Strauss, 1986; Walkerdine, 1990). *Cuadernos de Psicología* aimed not only at the local production but also to an international worldwide academic production. Along with *Revista de Psicología* (Journal of Psychology) from the Universidad Nacional de Colombia (National University of Colombia) (1956) and *Revista Latinoamericana de Psicología* (Latin American Journal of Psychology) (1969), *Cuadernos de Psicología* was one of the pioneer journals in the country and the region (Ardila, 1986; Giraldo & Rodríguez, 2000).

Orozco traveled in 1979 to England, with the purpose of studying a diplomate in education at the University of London directed by Basil Bernstein (1924–2000), who had a strong behavioral emphasis and who also took aspects of sociology of education in his research. Educational sociology allowed Mariela to acquire stronger theoretical and methodological elements in order to acknowledge and explore the environments in which the child develops.

During her journey to England, Mariela Orozco found in the area of mathematical development in children her definitive research field. "It was fascinating to watch how all those kids learned" (Orozco, personal communication, December 15, 2019). At her return, to Cali, Orozco resumed her work as a professor of psychology and started some works with her undergraduate students on mathematical learning. In 1986, she spent her sabbatical year in the Institución Municipal de Investigación Psicológica Aplicada a la Educación (IMIPAE) (Municipal Institution of Psychological Research Applied to Education) founded in 1971 by Piaget's disciples in Barcelona, with the purpose of linking the present-day knowledge in psychology to the pedagogical practice (IMIPAE, 1979).

In 1990, Mariela Orozco developed a demonstrative plan for Latin America financed by UNESCO; the plan was named "El Niño y la Escuela" (The Child and the School). The purpose was to carry on a diagnosis of the mathematical

and reading-writing areas in children from poor backgrounds. Orozco, who was in charge of the evaluation in the mathematical education area, noticed a phenomenon surrounding the knowledge of mathematics. The phenomenon was soon named by her as “La matemática de los niños” (the math of children), and it showed that 10% of the diagnosed children knew to count up to 5000 and 10,000. The results of the demonstrative plans had a great reception.

In 1992, she returned to Barcelona to carry out her doctoral studies with the IMIPAE. She sought advice from Juan Pascual-Leone (1933–), one of the precursors of the neo-Piagetian research, whom she had met in Cali. Pascual-Leone became her dissertation adviser, and his influence would give an opening to the study of mental processing (Pascual-Leone, 1987). The thesis named “Análisis microgenético y procesual de la construcción de la operación multiplicativa” (Microgenetic and procedural analysis on the construction of the multiplicative operation) had the purpose of creating a causal theory able to analytically explain the mental processes of the child.

Mariela Orozco was an essential element that made possible all the institutional changes for psychology, both inside the University of Valle and the region. She was among those who made it possible that the counseling psychology program became a full-fledged psychology program. Later on, she contributed to the establishment of a specialization and master programs that would lead in the 1990s to the origin of the Psychology Institute, the first step for the beginning of doctoral studies in psychology. She was the first director of the Psychology Institute, a special entity in the University of Valle with a research center; three undergraduate programs in the cities of Palmira, Buga, and Cali; a master’s program; and soon in 2005, a doctoral program (the first in Colombia) created by her and Rebeca Puche-Navarro.

Her greatest contributions to Colombian psychology have focused into two areas: the arithmetic in the child and the work related to the cognitive development in children coming from poor environments. Mariela Orozco describes her life as a conjugation of chance and contingencies linked to her professional work, brave and

restless, that made her so important in Colombian psychology. Mariela’s work fascinates the younger generation of psychologists that are interested in the developmental psychology field, as it was demonstrated in the high participation during the launch of her last book: *1, 2, 3 ... hasta mil. La aritmética de los niños, la aritmética para los niños (1, 2, 3 ... up to a thousand. Arithmetic of children, arithmetic for children)* (Orozco-Hormaza, 2019).

The academic career of Doctor Wenceslao Orozco y Sevilla, associated with the field of health sciences, began when he completed high school at

the Escuela Preparatoria de Jalisco (Preparatory School of Jalisco) of the Universidad de Guadalajara (University of Guadalajara) (UdeG). He entered the Facultad de Medicina (Faculty of Medicine) of the UdeG (1925–1930) obtaining the degree in Medicine, Surgery, and Midwifery, and that early brings him closer to the field of Psychiatry, to which he dedicated his professional life, being one of the main exponents of this medical specialty in Jalisco.

In 1930, he also began his career as a teacher, which he performed both at the Faculty of Medicine and at the Facultad de Psicología (Faculty of Psychology) of the UdeG in 1975, teaching courses such as Medical Pathology, Internal Pathology, Psychiatry, Medical Clinic, Physiotherapy, and Clinic of Psychiatry, among others. He was also head of the Laboratory Applied to the Clinic at the Instituto de Ciencias Médico-Biológicas (Institute of Medical-Biological Sciences); an extraordinary professor in courses such as Postgraduate Gynecology, Cultural Anthropology, History, and Philosophy of Medicine; guest professor of the Specialty of Gynecology-Obstetrics and History of Psychiatry; and interim professor of Cultural Anthropology.

During his professional career, he held various management positions, including the following: Secretario General del Sindicato Médico de Jalisco (General Secretary of the Jalisco Medical Union) and Presidente del Comité Estatal de Ayuda al Niño Indígena (President of the State Committee for Aid to Indigenous Children); he also collaborated in the revision of the Organic Law of the UdeG. In May 1962, he was appointed director of the Facultad de Medicina (Faculty of Medicine) at the UdeG, a position he held until 1965.

In addition, from 1956 to 1958, he was president of the Federación de Profesores Universitarios de la UdeG (Federation of University Professors) and Presidente electo de la Asociación Mexicana de Facultades y Escuelas de Medicina (president-elect of the Mexican Association of Faculties and Schools of Medicine) from 1960 to 1962.

He was a member of various academic institutions and founder and co-founder of some of them, among which are the Federación Médica

Mexicana (Mexican Medical Federation), of which he was a co-founder in 1948. He participated as co-founder of the Sociedad Jalisciense de Neuropsiquiatría (Jalisco Society of Neuropsychiatry), of which he would also be its president, and promoter of the Granja de Recuperación de Enfermos Mentales “La Esperanza” (Mental Illness Recovery Farm). He was also an active contributor to the World Health Organization. He founded the “Guadalajara” psychiatric sanatoriums for men and “San Camilo” for women, chaired the Comité del Premio Jalisco (Committee of the Jalisco Prize) in the modality of Sciences, and was part of the Asociación Médica Jalisciense (Jalisco Medical Association), the Sociedad Médica de Guadalajara (Guadalajara Medical Society), the Sociedad Médica del Hospital Civil de Guadalajara (Hospital Medical Society Civil of Guadalajara), as well as the League of Mental Health of the United Nations Educational, Scientific and Cultural Organization (UNESCO).

It was characterized by its constant struggle for science and the development of thought, for the updating of the behavioral sciences, and for discovering the mechanisms of the human mind.

In 1975, the committee for the creation of the Escuela de Psicología (School of Psychology) of the UdeG was established, made up of psychiatrists who at that time gave courses in Psychology at the Hospital Civil de Guadalajara (Guadalajara Civil Hospital) and at various local educational institutions. Among the members of that committee was Wenceslao Orozco, who chaired it and who, due to his extensive and recognized career, would become on June 16 of the same year the first director of the Escuela de Psicología (School of Psychology) and later of the Facultad de Psicología (Faculty of Psychology) of the Highest House of Studies of Jalisco, Universidad de Guadalajara (University of Guadalajara).

Within this institution, he performed as researcher and head of the Departamento de Ciencias de la Conducta (Department of Behavioral Sciences), as well as representative of the rector in the Student Admission Commission of the School of Psychology for the 1975–1976 school year.

In May 1977, he was elected president of the Consejo Nacional de Enseñanza e Investigación en Psicología (National Council for Teaching and Research in Psychology) (CNEIP), for 1 year.

The research work of Wenceslao Orozco y Sevilla focused on the study of various topics among which are epileptic syndrome, humoral mechanisms, subthalamic functional alteration, acromegaly, psychoneurosis, intersex states, sex chromatin, depression and maladjustment mechanisms, enzyme inhibition, depressive processes, alcoholism, and maladjustment mechanisms.

Among the many recognitions he received is the diploma of a founding member of the Unión Médica de Jalisco (Medical Union of Jalisco) and the diploma of a founding member of the Sociedad Jalisciense de Neuropsiquiatría (Jalisco Society of Neuropsychiatry). The 1976–1981 generation of graduates in Psychology from the UdeG bears his name; he was also recognized as a postmortem Emeritus Master of the UdeG. The Psychiatry service of the Antiguo Hospital Civil de Guadalajara (Former Civil Hospital of Guadalajara), an auditorium of the Facultad de Medicina (Faculty of Medicine), and one of the Faculty of Psychology bear his name.

Otero Álvarez, Joel

Born *Santiago de Cali, Colombia, January 6, 1945*

Carmen Elena Urrea Benites
Colegio Colombiano de Psicólogos, Cali,
Colombia

Keywords

Colombia · Mental health · Clinical
psychology · Addictions · Psychoanalysis

Joel Otero Alvarez completed his basic education in Cali at the *Colegio Santa Librada*, one of the most traditional educational institutions of the city, where countless intellectuals, academics, and artists were also educated. Otero attended the Universidad Nacional de Colombia (National University of Colombia) in Bogotá, where he graduated as a psychologist (1966) and also pursued his passion for theater: acting, teaching, directing, and writing plays conduced him to articulate his intellectual project based on finding the connection between aesthetics, philosophy, and literature. Otero choose psychoanalysis and addictions as subjects of his academic production in psychology, starting with his paper entitled “Psychoanalytic reflection of alcoholism.”

In 1967, Otero started his career in Bogota when he researched about the early consumption of psychoactive drugs in homeless minors and conducted psychological evaluations in order to give therapy to children and teenagers at youth detention centers. Throughout his academic life, Otero wrote several papers about addictions and drug addicts as a social phenomenon and a rising issue of the current times, which led him to categorize the traditional psychopathological models as “unsustainable and innocuous” interventions and proposed a different and novel approach from a transdisciplinary and aesthetic perspective (Otero, 2016).

Otero moved to Medellín in 1971 to start working at the Universidad de Antioquia (University of Antioquia), where he initiated the Department of

Psychological Investigations in 1975 that later became the Psychology Program which “was grounded on psychoanalysis with the purpose of educating in investigation based on a critic assessment of the traditional psychology; looking to gradually disassemble the vertical relationship professor-students and other structures of power” (Ortega, 1983, cited by Lopera, 2015). For 7 years, Otero taught introduction to psychoanalysis at this university and published a number of manuscripts questioning traditional psychology in its theory and methods. These publications became a reference for psychologists and psychoanalysts who would assume a position agreeing, reacting, or disagreeing, contributing to the psychology development in the region (Lopera, 2015).

In 1983, Otero joined the Universidad del Valle (University of Valle) in Cali, his hometown, where he worked as an associate professor and later as head of the Psychology Department. Otero taught courses on psychoanalytic theory and psychotherapy and also for other careers like theater, literature, economics, philosophy, social work, and sociology; he was also hired as guest lecturer for postgraduate courses in several universities of the country, in the areas of linguistics, pedagogics, and criminology. He directed theses and professional practices at the Hospital Psiquiátrico Universitario (Psychiatric University Hospital). He continued publishing his work in national journals and academic papers that reflected his concern to transcend the idea of a universal psychology by the application of psychoanalysis based on context to understand social changes.

Joel Otero Alvarez was well-known for his ability to understand psychoanalysis as a tool to drive change in the contemporary society; he was also aware of the role played by universities to contribute to the shaping of the cultural fabric of the country. This is the reason why Otero was deeply interested in addressing the possibility that psychoanalysis had to understand social, cultural, and political issues of the country. As a teacher, he deeply valued the engagement of the students, to whom he always considered that they could do remarkable contributions during his psychoanalysis and clinic psychology courses, a

scenario that he compared with a stage in the theater for the discussion of ideas and the shaping of new knowledge and new citizens.

In 1997, year of his retirement from the University of Valle, he created the Psychology Faculty of the Universidad de San Buenaventura (University of San Buenaventura) on its Cali branch and was its dean until 2003, during which time he obtained his master's degree as well. At this university, he developed an alternative proposal of psychology focused on the clinic and social context, understanding the society as multiethnic and multicultural. In his proposal, he highlighted the aesthetic language and sensibility as a tool to comprehend the human being, representing an innovative way to conceive psychology and its possibility to address the problems going beyond rationality and, in this way, achieving relevant and novel intervention responses.

Otero is acknowledged as the leader of an effort to develop an educational project that overcomes fragmentation in tendencies linked to psychology and, from theoretical approaches and clinical treatment, become more relevant and capable to address new social and cultural arising issues. He also contributed by promoting the importance of questioning foreign material when it comes to theories and approaches. Otero encouraged students, professionals, and teachers to look for the need to tailor their ideas and propose theories adapted to the complexity of the contexts in order to make effective interventions.

Otero argued that contemporary psychology was originated from what he called “the anthropological myth” to respond to the science and universal demands, neglecting the acknowledgement of diversity and the historic and social contexts. This is why he had a different proposal: a psychology that takes the city as a metaphor to name and integrate the human, social, and cultural perspectives, making a new paradigm for psychology to be understood from different disciplines to finally transcend the classic and universal conception of the human and address a plural conception of the society. This is the way to build knowledge that will transform the social issues based on questioning its social structures (Otero, 1999).

Joel Otero held a private clinical practice until 2007.

Oyervide Crespo, Pedro Francisco Fidel

Born *Cuenca (Ecuador) 8 July 1935*

Died *Quito (Ecuador) 8 August 2004*

Daniela S. Castro Falconí
Pontificia Universidad Católica del Ecuador,
Quito, Ecuador

Keywords

Ecuador · Psychoanalysis · Organization of institutions

Son of Fidel Arcesio Oyervide Durán and Rosa Delia Crespo, he was the second of five siblings. He was a seminarian at the *Congregación de los Redentoristas* (Congregation of the Redemptorists) in Cuenca (Guillermo García, personal communication, October 25, 2019). At the beginning of the 1970s he obtained a scholarship to continue his ecclesiastical studies in Paris and there he became interested in a subject of Psychology (López-Tello, 2018). Later, he abandoned his religious training and married Christiane Pelet with whom he had two daughters.

At the University of Paris 7, Dennis Diderot, studied Social Psychology under the direction of

Anne-Marie Rocheblave-Spenlé (1923–2000), who was a social-clinical psychologist, intricately linked to psychoanalysis. The title of his degree work was “Institutional Aggression,” in 1978. In France, he was directly related to Jacques Lacan (1901–1981), was part of his work team for some years, and acquired the fundamental bases for his exercise later as a Lacanian psychoanalyst. There he also met the psychoanalyst Charles Melman (1931–). For Oyervide (1996, p. 53), the “becoming a psychoanalyst through his own experience” means that only the personal experience of psychoanalysis can account for a preparation to be one; its clinical development started from that conception but it is not a guarantee of clinical action quality. From that vision the teaching of psychoanalysis is only possible from “a knowledge that produces domain effects and knowledge power” (Páez, 2016, p. 12).

Back in Ecuador, at the beginning of the 1980s, he joined the university academic activities in his hometown, in particular with the *Universidad de Cuenca* (University of Cuenca), and tried to form a working group on psychoanalysis, which ultimately did not materialize. However, Oyervide left the first seeds sown for the ideas of psychoanalysis to germinate later.

Oyervide migrated, in those same years, to the city of Quito, where he gradually entered the academic environment; later it was also linked with Guayaquil, in the same way through the university. However, Pedro Oyervide preferred to maintain a distant relationship with the university institutions that welcomed him: the Pontifical Catholic Ecuadorian University (Pontificia Universidad Católica del Ecuador) in Quito and the Catholic University of Santiago de Guayaquil (Universidad Católica de Santiago de Guayaquil). He chose to continue his work with more or less small groups of students and/or collaborators with whom he started the first Cartels, which is what work and training meetings are called from the Lacanian perspective (López-Tello, 2018).

In Guayaquil, he worked as the principal professor of the Profound Psychology seminary, with the support of the Catholic University, around 1980, despite the serious opposition that the name of the seminary had. Then, after leaving

the space offered by the university, he continued for 10 more years with his work of transmission of psychoanalysis through a seminar with the same name (Guillermo García, personal communication, October 25, 2019). As a teacher, he motivated his students to get involved with psychoanalysis by creating work cartels. He made these groups grow and injected dynamism into them by allowing their members to move between different cartels.

In 1991, together with a group of around 30 people, he founded the *Escuela Freudiana del Ecuador* (EFE, Freudian School of Ecuador) in Quito. Pedro Oyervide began the work of the EFE with the authorization of Charles Melman (1931–) and Marcel Czermak (1941–) of the French Freudian Field (internationally recognized psychoanalytic group) (Isabella, 2019). At the birth of the EFE, it is worth highlighting the participation of René Lew (1946–) and Néstor Braunstein (1941–) (Guillermo García, personal communication, October 25, 2019), psychoanalysts with extensive experience and particularly close to Pedro Oyervide. At present, the EFE continues to function as a place of study and work around psychoanalysis, closely linked to the Lacanian line, and has expanded its field of action to other cities in Ecuador.

One of Pedro Oyervide's greatest concerns was the transmission of psychoanalysis, a work to which he dedicated himself within the school he founded and also in other spaces. It is important to note that its modality was quite rigorous, which came to be taken as rigid because it was based on the detailed reading of selected texts (Álvaro Carrión, personal communication, November 20, 2019). According to Váscos (2016), this lent itself to the analyst being located as an idealized figure. With this pillar, the psychoanalytic circle around it supported a transmission model of exacerbated demand and difficult to understand for those who showed a first interest. Little by

little it was divided and a large number of the Lacanian psychoanalytic spaces that exist today in the country emerged in this way, in cities such as Quito, Guayaquil, and Cuenca. His greatest contribution was to sow interest in the study of psychoanalysis in Ecuador.

Brazil · Eugenics · Psychiatry

Physician and successor of Francisco Franco da Rocha (1863–1933) in the direction of Hospital do Juquery (Juquery’s Hospital), Antônio Carlos assumed the position in 1923, at the age of 25. He was the first to apply malaria therapy in cases of general paralysis at this hospital in 1925. He also carried out experiments with inoculation of *Plasmodium vivax* in patients, resulting in several scientific publications. In the 1930s, the technique was gradually abandoned at the Juquery’s Hospital (Tarelow, 2019, p.164).

Pacheco e Silva began his academic life as an audit student in the Pharmacy course at the Universidade Livre de São Paulo (Open University of São Paulo) and subsequently transferred to the Medicine course. Like his contemporaries, when the Open University of São Paulo ended

its activities in 1917, Pacheco e Silva transferred to the Faculdade de Medicina do Rio de Janeiro (Rio de Janeiro Medical School) – former Faculdade de Medicina da Universidade do Brasil (University of Brazil Medical School) – where he obtained his degree (Mott et al., 2007, p. 20).

He took further training courses in European clinics: In France, he specialized in neurology and psychiatry at the Faculty of Medicine of Paris (1920). He also attended the Nervous System Pathology Service (1921), located at the Hospital de Salpêtrière, coordinated by Professor Pierre Marie Charcot (1853–1940), as well as having attended the Hospital de Saint-Anne. He trained in Switzerland with Eugen Bleuler (1857–1939) and Constantin von Monakow (1853–1930). Afterward, he was in Germany where he followed the work of Emil Kraepelin (1856–1926) (Serra & Scarcelli, 2014, p. 86). In 1954, he completed his higher education at the War College (Escola Superior de Guerra) in Brazil.

In 1926, by invitation of the US State Department and commissioned by the governor of São Paulo, Carlos de Campos (1866–1927), he traveled to the United States to study the organization of assistance to psychopaths in that country. In that same year, he was in charge of establishing the plans for the Judiciary Asylum of the State of São Paulo (Manicômio Judiciário do Estado de São Paulo), whose construction was completed under his direction. Based on Morel’s Theory of Degeneration, he was one of the founders of the São Paulo League of Mental Hygiene (Liga

Paulista de Higiene Mental) (1926), of which he was the first president. He represented Brazil at the 1st Latin American Conference on Psychopathy and Legal Medicine (I Conferência Latino-Americana de Psicopatia e Medicina Legal), held in Buenos Aires (1927). In 1929, he inaugurated the “Pacheco e Silva” School (Escola Pacheco e Silva) at the Juquery’s Hospital – called “the first school for abnormal children” (Fiore, 1982, p. 167), where experimental psychology was applied, mainly from Osório César – and the Pinel Sanatorium (Sanatório Pinel) (both in the metropolitan region of São Paulo).

In 1930, he collaborated with the creation of the General Assistance of Psychopaths of the State of São Paulo (Assistência Geral dos Psicopatas do Estado de São Paulo), and after that he joined the chair of clinical psychiatry at the Faculty of Medicine of the University of São Paulo (Faculdade de Medicina da Universidade de São Paulo) (1935–1967). He was the founder of the Paulista School of Medicine (Escola Paulista de Medicina) (1933), where he was a full professor of psychiatry (1933 – 1960). At the Faculty of Law of the University of São Paulo (Faculdade de Direito da Universidade de São Paulo), he held the chair of Clinical and Forensic Psychiatry (1932–1933). He was vice president of the Institute for Rational Organization of Labor (Instituto de Organização Racional do Trabalho) (IDORT) (1931), developing recruitment techniques and professional “training” and also of the Open School of Sociology and Politics of São Paulo (Escola Livre de Sociologia e Política de São Paulo) (of which he was also full professor), having compiled his texts that were produced for the course on social service in a book format published in 1937. Pacheco e Silva also founded the chair of Psychosomatics at the Faculty of Medicine of USP (Faculdade de Medicina da USP) (1950), an area he already defended in the compilation of *Psychiatry and Modern Life* (1948), which highlights the entry of psychology into medicine from psychosomatic medicine.

He was superintendent of medical services and public assistance in the Constitutionalist Revolution of 1932, and president of the Society of Medicine and Surgery of São Paulo (Sociedade

de Medicina e Cirurgia de São Paulo). Still as director of Pinel Sanatorium (Sanatório Pinel), he was elected deputy to the National Constituent Assembly (1934) and deputy to the Legislative Assembly of São Paulo (1935–1937).

Pacheco e Silva held positions in scientific and corporate associations. He was vice president of the World Federation for Mental Health (1960), World Federation for Mental Health (1962), Psychiatric Association of São Paulo (Associação Psiquiátrica de São Paulo) (1967), Paulista Academy of Medicine (Academia Paulista de Medicina) (1933), Assistance to Psychopaths of the State of São Paulo (Assistência a Psicopatas do Estado de São Paulo) (1930), from the Union of Doctors of São Paulo (Sindicato dos Médicos de São Paulo) (1951), Brazilian Society of Medical Writers (Sociedade Brasileira de Escritores Médicos) (1974), “Forum Roberto Simonsen,” of the Federation of Industries of the State of São Paulo (“Fórum Roberto Simonsen” da Federação das Indústrias do Estado de São Paulo) (1931), and executive World Psychiatric Association (Associação Mundial de Psiquiatria) (1977).

He was also president of the International Anti-Communist League (Liga Anticomunista Internacional), in 1977. According to Talerow (2019, p. 66), his political bias reverberated in his work, and it is possible to identify in the first publications of the 1920s Pacheco e Silva’s aversion to ideals of socialists, communists, and anarchists.

Pacheco e Silva minimized psychoanalysis in the articles *Appreciation of Psychoanalysis* (1953) and *Basic Psychotherapy* (1959), claiming that the psychoanalytic method, if it had any value, would be inferior to the techniques of persuasion and suggestion (Alarcão and Mota, 2019, p. 281); in the preface to the book *Psychoanalysis: the mystification of the century*, he considered the area as “one of the greatest and most pernicious mystifications of this century” (Pacheco e Silva, 1970, p. 12). Although critical of psychoanalysis, Pacheco e Silva recognized its importance for the development of psychiatry and of Sigmund Freud’s work “stripped of exaggerations” (Pacheco e Silva, 1950, p. 334). According to

Alarcão and Mota (2019, p. 274), Pacheco e Silva's position on psychoanalysis and the defense to keep it as an exclusive practice of medicine fueled "distrust about the clinical performance of any other professionals, such as the psychologists."

On the other hand, as director of the Juquery Hospital (Hospital do Juquery), the actions undertaken by Pacheco e Silva, especially in the construction and creation of the School Pavilion, a locus recognized as "the first school for abnormal children" in asylum territory in the State of São Paulo, allowed the first dialogues between psychiatry, experimental psychology, and pedagogy in the beginning of the twentieth century.

Pacheco-Maldonado, Ángel Manuel

Born *San Juan, Puerto Rico (PR)*, 10 August 1946

Died *San Juan, PR*, 20 May 1999

Irma Roca de Torres

University of Puerto Rico, Río Piedras, San Juan, Puerto Rico

Keywords

Puerto Rico · Developmental psychology · Applied psychology and ethnopsychology

Ángel Pacheco was the only child born to Ángel M. Pacheco-Padró, a local government employee, and Catalina E. Maldonado, a federal government official in Puerto Rico. His maternal grandmother Juana Maldonado was a very important figure in his early years. She lived with the family and helped rear young Ángel. He was also strongly influenced by his aunt Antonia Pacheco, a teacher and educational leader, and his uncle Antonio

Pacheco, a legislator and close collaborator to Governor Luis Muñoz Marín (in office 1949–1965) His primary education years took place in parochial catholic schools; from 7th to 12th grade he attended *Colegio San José* (Saint Joseph College), a Marianist prep school. During school years, Ángel was president student council and class president and he got involved in social justice community projects and showed excellent academic achievement.

In 1968 he obtained a BA in Social Sciences with a minor in political sciences, from the University of Puerto Rico, Rio Piedras campus (UPR-RP). It was the Viet Nam era and Ángel was very active in the conscientious objectors' movement. Admission to the State University of New York at Albany PhD program in educational psychology and statistics spared him from the mandatory military service. He completed the doctoral degree in 1972. His dissertation put into test Lawrence Kohlberg theory of moral development in the Puerto Rican cultural setting.

Doctor Pacheco had the opportunity to spend a year of postdoctoral work (1972–1973) at Harvard Laboratory of Human Development under the sponsorship of the author of the theory of moral development, Lawrence Kohlberg (1927–1987). There he devoted his efforts to further analyze data on children's moral development demonstrating that cultural values and constructs play an important role in moral judgment development. Years later (1980–1983), he returned to the Harvard Graduate School of Education to further pursue his interests in anthropology and psychology under the auspice of renowned social anthropologist Robert A. LeVine (b. 1932). During those years he focused on the study of migrants' cultural adaptation and mental health issues. His experiences in this instance contributed to his conviction that culture is a potent dimension in the formation of the human being and to the consolidation of the person-in-environment paradigm to study and to better understand human behavior. The roots for his ethnopsychology lifelong project were already grounded. His years at Harvard were financed by a Ford postdoctoral fellowship and National Institute of Mental Health grant.

He also spent time at the Center for Advanced Study in the Behavioral Sciences, Stanford University, Palo Alto, in which occasion he participated at the Life Span Developmental Psychology Summer Institute, under the direction of German scholars Paul (1939–2006) and Margret Baltes (1939–1999). This experience reaffirmed Pacheco's belief in a competencies model of human behavior which strongly emphasizes the potential for optimization of human competencies across the life span vis a vis the deficit model. Successful aging is a key element within this perspective.

His first professional appointment was as scientific advisor to the Puerto Rico state antidrug agency, a position which allowed him to develop a broad research and evaluation agenda on the services needed by the drug-users population and the service programs targeted to them. During his incumbency in the early 1970s he developed strong collaborative ties with the germane agencies from various Latin American countries, such as Brazil, Argentina, and Venezuela.

Dr. Pacheco devoted most of his professional life (more than 25 years) to academic work in the Psychology Department, UPR-RP. There he combined teaching, research, and administrative skills serving as department chairperson. Throughout the years he developed strong academic collaborations with well-known colleagues from prestigious academic centers such as Seymour Wapner (1917–2003) and Bernard Kaplan (1925–2008) from the Heinz Werner Institute of Developmental Psychology at Clark University, MA; Rogelio Díaz-Guerrero from *Universidad Nacional Autónoma de México* (UNAM, National Autonomous University of Mexico); José Miguel Salazar from the *Universidad Central de Venezuela* (Venezuela's Central University); Paul B. Baltes (1939–2006) from the Max Planck Institute for Human Development, Berlin, Germany; C. Takiji Yamamoto from Hiroshima University, Japan; anthropologist Michael Agar (b. 1945) from UCLA; and sociologist Peter K. Manning (b. 1945), among many others.

As a researcher he devoted efforts to study a gamut of themes and problems such as substance abuse, violence, children's concept of law, moral

development, migration and mental health, and child rearing and parental values, among others. In Puerto Rico he promoted the study of Piaget's theory of cognitive development, the anti-psychiatry movement led by Thomas Szasz, the Soviet psychology school represented by Alexander Luria (1902–1977) and Lev Vygotsky (1896–1934), the life span developmental psychology approach in the study of human development, the importance of phenomenology in understanding the human beings, and the use of nonobtrusive measures and the qualitative methodology to study social behavior. He pioneered research in the fields of health psychology, environmental psychology, applied psychology, and aging. His late work focused in the importance of studying human behavior as it unfolds in the complex intricacies and meanings imposed by the culture in which the person evolves. This effort culminated in the publication of the book *Ethnopsychology: Scientia nova* (1994), a joint venture with the Mexican psychologist Rogelio Díaz Guerrero.

Dr. Pacheco also served as a private consultant to diverse entities, such as corporations, educational institutions, industries, and other professionals. He gave advice in curriculum development to medical schools, frontier drug control strategies to Latin American countries, hospitality services delivery and evaluation to international hotel chains, personnel selection and assessment in industrial settings, jury composition and psycho-legal litigation strategies to law offices, expert witness testimony evaluation criteria for the judiciary, and mental health quality assurance to health plans, among others.

His passion for knowledge and psychology lead him to organize an impressive professional library which he was always willing to share with both students and colleagues. Titles from the most diverse knowledge areas (i.e., philosophy of science, phenomenology, anthropology, statistics, research methods, history, literature, psychology, sociology, law, etc.) occupied at least five rooms of his house and covered the walls of his professor office at the University of Puerto Rico. Many of his students and colleagues considered him as one

of the most knowledgeable psychologists in Puerto Rico.

He is survived by his two sons Ángel Jaime, a lawyer, and Francisco Javier, a classical musician.

Alfredo Palacios was an Argentinian writer, lawyer, legislator, and socialist politician whose forays into the psychology of work and labor made him a key figure in the history of Argentinian psychology.

Palacios was born in Buenos Aires, the son of a Uruguayan lawyer and a Uruguayan socialist. He was stimulated early on by his parents' mixture of socialism, Catholicism, and faith in rational science. Palacios attended the Colegio Nacional Central (the Central National College). In 1893, with 15 years of age, he collaborated with several newspapers and journals, thus being able to pay for his university studies. In 1895, the 17-year-old Palacios began his graduate studies at the Universidad de Buenos Aires (University of Buenos Aires), where he graduated with a law degree: his original dissertation, a powerful diatribe against the oppression of workers by the Argentinian oligarchs and dominant classes, was

famously rejected by the university and had to be redone (García Costa, 1998).

Albeit raised in a catholic-workers environment, during his secondary and university studies, Palacios became enthralled with atheist, socialist, and anarchist authors. As such, by the time he was elected to the Buenos Aires' legislature in 1902, he was clearly identified as a socialist concerned with the rights of laborers. His appointment to the Chamber of Deputies for the fourth Circumscription of Buenos Aires in 1904 made him the first socialist in the Argentinian Congress, and also the first in the entire American continent (Anonymous, n.d.).

As a member of the Congress, Palacios pushed for legal reforms that would widen the rights and benefits of laborers, especially those who were employed by large estates and companies. He managed to either pass or advocate for several such reforms regarding inheritance taxes (1905), the work conducted by children and women (1907), and the 8-hour work shift (1929) (Pigna, 2020; Poy, 2018). Reflecting his catholic upbringing, in 1905, he actually managed to persuade his fellow congressmen about the need for a law guaranteeing a “descanso dominical” – a mandatory Sunday rest – by claiming that not even God had worked on a Sunday (Anonymous, 1905).

Quoting the Holy Bible, however, was not enough to persuade most of Palacios' conservative-oriented colleagues. As such, he also championed science as a means for basing and justifying his proposed laws. Palacios argued that according to science, the secret of social evolution laid in class struggles and that a biological imperative drove the working class towards its own preservation and evolution; thus, attacking or neglecting laborers meant the attack or neglect of the entire Argentinian society (Poy, 2018). Such an amalgamated reference to Spencerism, biology, and social dynamics was keenly received at a time when Argentina was under the influence of positivism as an extended political program for both establishing the State and organizing its citizens (Vezzetti, 1988; Vilanova, 2001).

Widely defined as a natural science, psychology – especially its experimental and psychophysiological orientations – was a key part of such a

positivistic program in Argentina. And it was in these fields, where Palacios made its main empirical and theoretical contributions. He was both receptive and critical of the North-American developments in what Hugo Münsterberg (1863–1916) called “predictive applied psychology, or psychotechnics,” and he undertook original experimental research in order to advance his “primordial concern” about the health and well-being of laborers (Palacios, 1922/1944, p. 12). In his influential *La Fatiga y sus Proyecciones Sociales* (Fatigue and Its Social Consequences) first published in 1922, Palacios carried out an experiment that aimed at assessing the influence of physical and mental fatigue on the efficiency and behavior of workers in public services (Ibarra, 2014, pp. 94–102). He managed to prove that workers weakened as the work day developed, and that fatigue was not only a muscular and physiological phenomenon as seen in urine, heart rate, and respiration rates, but was also a phenomenon consisting of specific, inner, and purely psychical sensations (Palacios, 1944; Blanco & Carro, 2014). Palacios could then easily conclude that extended work shifts threatened the worker’s health and made them more susceptible to infections, diseases, and work accidents (Klappenbach, 2007; Vezzetti, 1988).

In 1923, Palacios himself set up the Laboratory of Psychophysiology at the Facultad de Ciencias Jurídicas y Sociales (Faculty of Juridical and Social Sciences) at the Universidad de La Plata (the University of La Plata) (Palacios, 1924). Backed up by the Laboratory, Palacios argued in favor of professional and vocational guidance as a part of psychotechnics and pushed for the need to establish guidance systems which would benefit both employers and employees. As a consequence, he backed up other psychology-related initiatives, such as Wundt’s alumni Carlos Jesinghaus’ (1886–1950) proposal in 1923 to establish an Institute of Professional Guidance, which was effectively opened in 1925.

Palacios was professor at La Plata’s Facultad de Ciencias Jurídicas y Sociales and at Buenos Aires’ both Facultad de Ciencias Económicas (Faculty of Economic Sciences) and Facultad de Derecho (Faculty of Law), of which he also

became Dean. He first resigned to his teaching posts in 1930, after Argentina’s first *coup d’état*. Over the following three decades, his tenure as senator was constantly interrupted as a result of either involuntary imprisonments (1951; 1953) or voluntary opposition to military regimes (1943–1944). Nonetheless, he maintained an active professional life, advocating for the establishment of both a National Department of Maternity and Child Hygiene and a National Bureau of Public Health and Social Assistance (García Costa, 1998).

The heir of both romanticism and scientism, Palacios maintained a lifelong commitment to the socialist cause, declaring just a few days before his death that “[the Argentinian] youth will see to obliterating those pledges and agreements that damage our [country’s] dignity and our sovereignty” (Palacios, 1965, n/p). Through his efforts, Palacios became a key figure in bridging political debates and legislation and experimental psychology; he remains a paradigm of the complex relations psychological science maintained with Argentina’s public sphere during the first decades of the twentieth century.

Mexico · Subjective wellness · Quality of life · Resilience · Poverty

She studied her undergraduate degree majoring in Psychology at Instituto Tecnológico y de Estudios Superiores de Occidente (Institute of Technology and Higher Studies of the West) (ITESO) (1984–1988), a specialty degree in Systemic Psychotherapy at Instituto de Psicoterapia Sistémica de Occidente (Systemic Psychotherapy Occidental Institute) (1985–1988), specialty course in Computing at ITESO (1990–1991), and a master's degree in Clinical Psychology at Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM) (1992–1994), receiving Honorific Mention in her thesis and dissertation. She obtained the Gabino Barreda Medal by UNAM, as she had the highest-grade average when finishing her master's degree (May, 1997).

She also studied her PhD at UNAM from 1995 to 1998. She was a full-time academic worker in the Psychology Department at Universidad Iberoamericana (Iberoamerican University) (IBERO) in Mexico City from 1996 to 2016. She was also responsible for the research line regarding Vulnerable groups, Quality of life, and Family, all in said university.

She received diverse financial aid for research, among them, the mixed fund of the Secretaría de Desarrollo Social (SEDESOL) (Ministry of Social Development); dependence of the Federal Executive Power of the Mexican Republic, which is in charge of offering support programs for general

society; and the Consejo Nacional de Ciencia y Tecnología (CONACyT) (National Council for Science and Technology), entity specialized to articulate public politics for the federal government, as well as promote the development of scientific research and technological research and innovation, to boost technological modernization in the country. This, to carry out three different investigations, two of which have national representativity: the effect of psychosocial variables on social mobility in beneficiaries from the “Opportunities” Program as well as the identification of a Resilience Model and its relationship with social mobility in said beneficiaries (Palomar 2015).

Social mobility can be understood as the way in which people or social groups move upwards or downwards in class positions within a social hierarchy. The Opportunities Program was born in 2002 as an initiative from the Federal Executive to contribute to families in extreme poverty and help them leave said condition through impulse and strengthening of the development of individual and collective capacities, via entailing with development programs.

Palomar’s research had the objective of getting to know the individual, familiar, academic, and social factors that explain social mobility from the Opportunities Program beneficiaries that managed to cross the line of poverty, even when these people received aid for an additional amount of time, to avoid their falling into extreme poverty once more.

To achieve this, she applied questionnaires that considered at least 15 variables organized into 4 areas: individual, academic, familiar, and social. The selected sample from a universe conformed of 5,512 active homes in the Opportunities Program since 2003 was made up of 602 homes with 913 people, from which 692 were the program holders and 311 their spouses.

The questionnaire was applied through individual interviews, face to face, carried out at the homes of those selected participants. One of the most interesting findings of this research was the variable of belonging, which was included in the regression’s equation with a negative sign.

Besides showing the possibility that belonging and membership to groups helps decrease the

probability of living through social mobility, the research found that the factor of religiosity also predicts negatively the ascendant social mobility. This is to say, the lower the score in religiosity, the higher the level of social mobility. Therefore, people with strong beliefs about the existence of external factors that determine their life could be more prone to self-victimization and to remain in extreme poverty.

In marginalized groups, said the PhD Palomar (2016), “solidarity is a condition that has enabled survival, given that received favors, and instrumental and economic aid received compel individual to form relationships through reciprocity, which can limit their economic growth” (page 1).

Her trajectory in the field of research specified in topics such as vulnerable groups and quality of life and family. Because of this, she received the Prize Dr. Rogelio Díaz Guerrero, given to people who research on psychosocial and ethnological topics, awarded by the foundation named the same and the Asociación Mexicana de Psicología Social (AMEPSO) (Mexican Association of Social Psychology) in 2012.

Her psychosocial research wanted to demystify wrong ideas, for example, the belief that people are poor because they want to be or that they all live in a situation of promiscuity. Through her research, she pretended to confirm or refute hypothesis, theories, and beliefs like the ones mentioned above, getting to know the group of people and trying to understand the circumstances in which some behaviors can be seen. However, she was overwhelmingly worried about research only staying on paper and solely read in academic spheres.

She was a member of the Technical Council and the Academic Committee for the creation of the Examen General de Calidad Profesional-Psicología del Centro Nacional de Evaluación para la Educación Superior (CENEVAL) (General Quality and Professional-Psychology Exam from the National Assessment Centre for Higher Education), from 1997 to 2001. She was, as well, an advisory member of diverse collegiate bodies at IBERO, such as the Instituto de Investigaciones sobre Desarrollo Sustentable y Equidad (Research Institute for Sustainable Development and Equity), the Departamento de Educación

(Education Department), the Dirección de Investigación (Research Direction), and the Departamento de Psicología (Psychology Department). She belonged to the Sistema Nacional de Investigadores (National System of Researchers) (SNI level 2).

She was part of the Editorial Committee of different magazines, like the *Psicología Iberoamericana* (Iberoamerican Psychology), the *Revista Latinoamericana de Psicología* (Latin-American Journal of Psychology), the *Revista Mexicana de Psicología* (Mexican Journal of Psychology), the *Revista Mexicana de Investigación Educativa* (Mexican Journal of Educational Research), and the *Revista Interamericana de Psicología* (Interamerican Journal of Psychology) among others. Also, she judged in some magazines in Mexico, Latin America, and Europe: *Journal of Happiness Studies*, *Journal of Environmental Psychology*, and the *Revista de Psicología Social* (International Journal of Social Psychology). She evaluated graduate programs from the Programa Nacional de Posgrados de Calidad (National Postgraduate Quality Program) (PNPC), from CONACyT, and for a vast number of research projects from distinct announcements, both regionally and nationally, and for the process of candidate selection to study their graduate degree abroad.

She pertained to some institutions like the IACCP (International Association for Cross-Cultural Psychology), the International Society for Quality-of-Life Studies (ISQOLS), the Sociedad Mexicana de Psicología (Mexican Society of Psychology) (SMP), and the Sociedad Interamericana de Psicología (Interamerican Society of Psychology) (SIP/ISP). She was a member of the Directive Council at the SMP from 2005 to 2008.

Paraguay · Sociology · Social psychology · Positivism · Socialism

Ignacio A. Pane was a Paraguayan intellectual from the 1900 generation, called *novecentist*, who stood out both at the university teaching and in his publications, as well as in the political and journalistic field. The son of migrants in the impoverished post-war Paraguay at the end of the nineteenth century, he completed his high school's studies in science and letters at the Colegio Nacional (National High School), and later received his law degree at the Universidad Nacional (National University) (Cattivelli Taibo, 2011).

He was, along with Cecilio Báez (1862–1941), one of the promoters in the country of social psychology from a positivist perspective, and also approached from the field of sociology. Like Báez, Ignacio A. Pane (1917) was a professor of sociology at the National University, which led him to write on the subject as a teacher concerned with the instruction of his students. In the text, Pane described the relationships between social, individual, collective, and mass psychology. Pane also opposed the *spiritual* approach to psychology, and defended the positivist theoretical model. He also showed a special interest in the psychology of art (García, 2005, 2009, 2017).

Although both were positivists in their approach to sociology, they were very different in terms of political and social thought: While Báez was a liberal, Pane was a member of the Partido Colorado (Colorado Party), holding ideas contrary to liberalism. Even Pane considered himself a socialist and opposed to liberal economics and individualism. This dichotomy between being intellectually positivist and politically anti-liberal or socialist was quite common at the beginning of the twentieth century, as was the case of the Italian criminologist Pietro Gori (1865–1911) who visited Paraguay in 1901 giving lectures, that he was academically positivist but politically anarchist (Fuentes Armadans, 2018). Likewise, Pane accompanied the revisionist demand of a nationalist nature undertaken by Juan E. O'Leary (1879–1969), and contrary to Báez perspective.

He was not the first with both social or socialist ideas in Paraguay at the beginning of the twentieth century: The intellectual Rafael Barret (1876–1910), of Spanish origin, was one of the critics of economic liberalism and individualism since anarchism. Feminism and socialist ideas emerged with other contemporary novecentist intellectuals such as Serafina Dávalos (1883–1957), and with Telemaco Silvera (1875–1931) and Ricardo Brugada (1880–1920), the last two belonging to the Colorado Party. His early death interrupted his academic and political career.

Mexico · Spain · Psychodiagnostics ·
Rorschach

He was a Spanish physician and psychiatrist. He studied his Bachelor Degree at Universidad de Santiago de Compostela (Santiago de Compostela University, 1930) and also a Ph.D. at Universidad de Madrid (Madrid University, Marco, 2010, quoted in León, 2015). From 1939 he lived in Mexico, because of the Francoist dictatorship in Spain, and spent almost all his life in this country, having his private practice as a physician and also teaching at Universidad Nacional Autónoma de México (National Autonomous University of Mexico) (UNAM).

He was chief at the Psychiatry Services, Ministerio del Interior (Ministry of Interior), Spain. He worked at Prague and also at Moscow, Научно-исследовательский институт мозга (Brain Scientific Research Institute); hence, he spoke Czech and Russian (Marco Igual, 2018).

León (2015) considers that Pascual del Roncal also has an important place as a translator of basic works in the mental health field, such as “Sexual behavior in the human male” by Alfred Kinsey (1894–1956).

Pascual del Roncal is a pioneer in practicing the Rorschach test at Mexico. Three important Medicine students used the Rorschach Psychodiagnostics in order to complete their bachelor’s degree theses: Santiago Ramírez, psychoanalyst; Ramón de la Fuente, psychiatrist; and José Velasco Alzaga.

They were relevant practitioners in their fields of study (Facultad de Psicología, 1997).

Federico Pascual del Roncal wrote a very important book, *Rorschach Psychodiagnostics: Theory and Practice*. This text includes a relevant theoretical review and also contains an important contribution: scoring tables for the different responses in terms of localization, determinants, and contents. These tables are a valuable material for those professionals to psychological testing based on Rorschach test. In reviewing Pascual del Roncal’s book, Baranger (1949) points out that it is “a valuable and useful instrument,” stressing that the text is based on a research with 4500 subjects and that it includes “abundant practical material.”

Federico Pascual del Roncal recollected all of the Rorschach literature existing till those days. After introducing the book with some history about this psychodiagnostic technique, Pascual reviews the Scourig method for scoring and also its interpretation.

Pascual based his book on the Bruno Klopfer (1900–1971) scoring method (Klopfer and Kelly, 1974), because it was the most complete and valuable way to do it, and mostly because his main author, Herrmann Rorschach (1894–1922), died before he could complete his work.

Last, but not least, this book refers to the psychological and psychiatric uses of the Rorschach psychodiagnostics. It includes various original examples and many useful tables containing multiple possible responses. Baranger (1949: 314) considers this manual as “an excellent base for a dynamic interpretation of this test.”

In 1951, Pascual del Roncal became part of a commission for a new psychology bachelor’s degree curriculum, along Guillermo Dávila, José Luis Curiel, and Oswaldo Robles. They also made a master’s degree proposal with 27 subjects, including “Projective Testing Practice” as an optional subject that should include Rorschach test, among other techniques (Robles, 1952: 251–253).

An article by Ramón León (2015) includes a full list of publications by Federico Pascual del Roncal, as well as biographical data, context, and legacy by this author. His written works can be

divided into three sections: psychiatry, Rorschach test, and a short section about psychoanalytic theory.

Pasquali, Luiz

Born *Gaurama, (Rio Grande do Sul)*,
14 December 1933

Manuela Ramos Caldas Lins
University Center of Brasília (UniCEUB),
Brasília, Brazil

Keywords

Brazil · Psychometrics · Psychological tests

Luiz Pasquali is responsible for the dissemination of theoretical and technical knowledge regarding Psychological Assessment, especially those related to the area of measures. He was concerned with the scientificity of psychology since the beginning of his professional life, acting actively in the search for strategies that would help the advancement of Psychological Assessment and Psychometrics in Brazil. His writings, for a long time, were exclusive references for those who wished to know and get deeper in these areas.

He has a wide and diverse background, which certainly contributed to the plurality of his contributions. During the 1950s and 1960s, he concluded several undergrad graduations, such as Philosophy [1957; Instituto Franciscano de Filosofia (Franciscan Institute of Philosophy), Paraná], Pedagogy [1961; Universidade Católica de Petrópolis (Catholic University of Petrópolis), Rio de Janeiro], and Psychology (1966; *Université Catholique de Louvain*, Belgium). Additionally, he earned a master's (1967) and a doctorate degree (1970) in the area of Psychology, both at the *Université Catholique de Louvain*, under the guidance of Antoine Vergote (December 8, 1921–October 10, 2013).

Regarding his academic life, in 1970, he was selected to work as an assistant professor in the Department of Psychology at Grand Valley State Colleges in Michigan (the United States), where he began his career as a university professor. Three years later, he returned to Brazil and joined the Pontifícia Universidade Católica do Rio Grande do Sul, PUC-RS (Pontifical Catholic University of Rio Grande do Sul), where he taught several subjects (for example, History of Psychology, Personality Psychology, and Research and Statistics Methods) and contributed to the creation and Coordination of the Master in Psychology.

In 1975, he moved to Brasília and joined the Institute of Psychology at the University of Brasília (UnB). Later, in 1991, he became Full Professor of Psychology at this university, retiring in 2004, but he became an Associate Researcher at the Programa de Pós-graduação em Psicologia Social, do Trabalho e das Organizações, PSTO (Postgraduate Program in Social, Labor and Organizational Psychology) of that institution. Shortly

after, in 2006, he received the honorary title of Emeritus Professor at this same university. At UnB, he taught dozens of subjects in undergraduate and graduate courses in the field of Psychology, especially related to the area of measures (for example, Factor Analysis in Psychology, Psychometrics and Psychological Examination Techniques). In addition, he founded the Psychology, Laboratório de Psicologia, Avaliação e Medidas, LabPAM (Evaluation and Measurement Laboratory), in which various researches that enabled the construction and validation of several psychological instruments were carried out, many of which were recognized and approved for use by the Conselho Federal de Psicologia, CFP (Federal Council of Psychology). Still at UnB, from 2001 to 2007, he joined the Centro de Seleção e de Promoção de Eventos (CESPE; atualmente Centro Brasileiro de Pesquisa em Avaliação e Seleção e de Promoção de Eventos, CEBRASPE) [Center for Selection and Promotion of Events (CESPE; currently the Brazilian Center for Research in Evaluation and Selection and Promotion of Events, CEBRASPE)], being responsible, along with his team, for the evaluation of more than 50,000 candidates.

Furthermore, in 1997, during the 27th Annual Meeting of the Sociedade Brasileira de Psicologia, SBP (Brazilian Psychological Society), Luiz Pasquali founded the Instituto Brasileiro de Avaliação Psicológica, IBAP (Brazilian Institute for Psychological Assessment). Its purpose is to represent the area in organs and institutions of interest to the psychologist, being present in discussions and assisting in decision-making. Therefore, it has proven to be highly relevant for the advancement of Psychological Assessment in Brazil. Later on, in 2002, with his colleagues on the IBAP board of directors, he founded the magazine Psychological Assessment, which remains the official vehicle of this Institute. It has published articles on adaptation and construction of instruments, emphasizing empirical studies that prove parameters of measures.

From 2014 to 2016, Luiz Pasquali was part of the Comissão Consultiva em Avaliação Psicológica, CCAP (Consultative Commission

on Psychological Assessment), created by the CFP. This commission is responsible for discussing evaluation processes, proposing technical rules and resolutions, booklets, and other resources that promote and ensure the quality of Psychological Assessment in Brazil, from its preparation, adaptation, commercialization, and use. Therefore, it is essential to ensure the advancement of this area in the country, allowing professionals to have access to quality information and, as a result, a practice based on scientific knowledge.

In addition to its direct management of regulatory agencies, he has been a member of the editorial board of several magazines on the national scene, highlighting *Avaliação Psicológica* (Psychological Assessment), *Boletim de Psicologia* (Psychology Bulletin), *Estudos de Psicologia – Campinas* (Psychology Studies – Campinas), *Psicologia: Teoria e Pesquisa* (Psychology: Theory and Research), and *Psicologia: Reflexão e Crítica* (Psychology: Reflection and Criticism). Furthermore, he has contributed as a reviewer for these and many other magazines [for example, *Revista Aletheia* (Aletheia magazine), *Interação em Psicologia* (Interaction Psychology) e *Psico-USF* (Psycho-USF)].

Beyond the university, Luiz Pasquali founded two companies over the years, both based in the city of Brasília. In 2006, already retired, he founded LabPAM, a company created from his experiences with the creation of the Laboratory of the same name at UnB. The aim of this corporation is to offer society products and services related to Psychological Assessment. Following this same line, in 2018, he founded P & T Psychodata, a company which purpose is to prepare and provide psychometric tests, conduct professional analysis and map organizational skills, through the use of advanced psychometric techniques.

Throughout his career, he published 78 scientific articles, some of which were highlighted in journals of impact in Brazil [some examples: *Psicologia: Teoria e Pesquisa* (Psychology: Theory and Research), *Avaliação Psicológica* (Psychological Assessment), *Psico-USF* (Psycho-
